Mr. WAKELIN, chairman of the Shoreditch Bath Commissioners, held that any public bath built more than ten years ago was not worth inspection, and he had seen nothing in Scotland, even as far north as Aberdeen, or on the Continent, from which anything could be learned by those acquainted with the latest English baths. He regarded 100ft. by 40ft. as quite large enough for any swimming-bath. He did not say that the Shoreditch baths represented perfection; but the architects were hampered in their plans by the form of site and the prohibitive cost of additional land. He feared that committees in arranging competitions did not always know exactly what they wanted.

Mr. MATT GARbutt criticised adversely the suggestion to arrange a passage behind the dressing-boxes.

In replying to the vote of thanks, Mr. SAXON SNELL observed that the President's suggestion to widen out the middle of the platform on either side of the bath, and set back the boxes to an elliptical line of frontage, was an excellent one, provided the site would allow of it. It would have a fine architectural effect, and would afford more dressing room. He quite agreed with the suggestion that, if an architect could not carry out the engineering details himself, he ought to apply to a first-class consulting engineer. The engineer, alas, had no respect whatever for architectural features. He had not found slate slippery or easily discoloured as a bath edging if kept clean; it should be roughed occasionally. He had found Portland stone wore very quickly, and tended to become green, and marble, for like reasons, was not a success as a paving material. The new paving he was thinking of trying was Rust's mosaic, which was really cast glass, and promised well. Side galleries should be set, as at Shoreditch, at an angle of 45°, and not sufficient use was made of end galleries. A pathway at the back of the boxes was an abominable arrangement, but was adopted in the United States and in Germany; a subway was equally useful, and was more easily kept under supervision. If asphalt was employed as a lining for baths, it should be in two thicknesses, overlapped to avoid the risk of pin-holes. If, from ideas of economy, the asphalt is omitted, a coating of cement, well trowelled, must be used. In gas-holder tanks no asphalt was used, but the cement rested on a puddled backing, and this was impracticable in baths, owing to the subways. It was impossible to construct a small bath more cheaply than a large one, and a fair cost per cube foot was about one shilling. The club-room in the second-class baths was for the use as a dressing-room of children in any one school.

#### CALLENDER'S BITUMEN DAMPCOURSE.

THE increasing importance of rendering our buildings damp-proof is acknowledged by all. The profession have tried a great many materials for dampcourses; but the unanimous opinion is that pure bitumen is the best form in which to apply this preventive, and Callender's Pure Bitumen Dampcourse, made from pure Trinidad bitumen, appears to have taken the place of all cements and felts. One of the desiderata of a good dampcourse is that it should not crack under the weight, or when bent. The illustrated list of applications of this valuable material is a proof of the value of an elastic bitumen in which there is no admixture of pitch or gas-tar. Callender's pure bitumen course is made in lengths of 24ft., and of any width up to 72in., so that it can be easily inserted as a damp course, and bent up the outer surface of wall, if desired. As a dampcourse as well as a sheeting, this pure bitumen has been used in numberless public buildings, tunnels and bridges, water and sewage works, water-tight tanks, &c. For vertical sheets to tank walls bitumen "bonding cases" are made for fixing into main wall before the 4½in. facing is built. The bitumen sheeting lines the main wall behind the 4½in. facing, and is bonded by these "cases" to the work at intervals, making a perfect water-tight tank. The attested experiments recorded—all severe tests—show the perfectly water-tight and impenetrable character of Callender's Bitumen Dampcourse.

The opinion of other engineering experts, such as that of Messrs. Bramwell and Harris, of Great George-street, show the perfectly impervious nature and other qualities of the bitumen to withstand changes of temperature. Callender's pure bitumen dampcourse has been used on numerous buildings, views of which are given, such as the Claybury Asylum for the London County Council, Corporation Asylum, Oldham, on numerous houses in the London suburbs—Herne Hill, Croydon, Hammersmith, Harrington, Stroud Green, Dulwich, Bedford, Brighton, Bristol, Blackburn, Buxton, Coventry, Nottingham, Sheffield, Glasgow, &c., &c. We recommend our readers to use this dampcourse; all particulars about which may be obtained of George M. Callender and Co., 11, Victoria-street, Westminster.

#### LEADLESS GLAZES IN POTTERY.

MR. W. P. RIX, in a paper read before the Society of Arts, in London, the other evening, discussed the possibility of the use of leadless glazes in the manufacture of pottery. He described the various efforts which have been made during the past century to exclude lead from glazes, and showed specimens of pottery made without its aid, but said none of them could be considered quite successful as applied to coarse earthenware, however suitable they might be for porcelain, and, apart from the results produced, they did not appear to have been economical. Yet he gave the leading houses great credit for their efforts to solve the problem. Pottery with leadless glazes if applied to earthenware became practically a new manufacture, involving large sacrifice of plant, &c., which meant ruin to the small potter. Few of such glazes had survived the preliminary ordeal, and fewer still had entered the commercial stage. After noting in detail the improvements made by Mintons, Doultons, and many other firms, Mr. Rix said that, notwithstanding their apparent success, it could not be assumed that they had obtained decisive proof that the general adoption of lead-free glazes was yet possible. It must be proved whether greater expenditure in fuel was needed, and how far the more accurate control of the glaze-dipping and firing could be met. Such a change could not be made till the new product was shown to be free from increased cost of manufacture. It was therefore still necessary as a precaution, while further experience was being gained, to find the best means of reducing the necessary lead in the present glazes, and to secure the permanent fritting of the whole. The fritting of lead with silica, or borax, or stone, could only produce innocuous results when the proportions of earth were such that the whole was chemically combined in a stable form. Most leadless glazes had three objectionable properties—opacity, sluggish fusibility, and inequality of texture. Sluggish fusibility left the slightest inequality of thickness apparent after firing. The absence of

lead caused the glaze to be more viscid, but it also made it slower in its response to the fusing temperature. Glazes without lead, therefore, must be dipped as thinly as possible, and much more uniformity of dipping was necessary. Surface inequality gave rise in some glazes to an egg-shell or pitted texture, depriving the ware of the smoothness essential to cleanliness. The permanence and stability of all glazes without lead was of great importance. Owing to the large place occupied by the alkalies as fusible basic substances for lead, it was easily possible to obtain combinations which would prove disastrous in this respect, for whereas lead had proved a reliable support to stability, the alkalies were notoriously treacherous. Doubtless little opportunity had occurred to thoroughly prove the latest mixtures. All that could be said was that they had stood the most severe exposure and the roughest usage without injury. It might, however, be safely stated that with the exercise of due intelligence in compounding a formula no serious risk need be incurred. The scientific data available were amply sufficient to protect the potter. The use of leadless glazes had been fitful and exceptional. Up to the present it could not be said that for the bulk of the trade they had proved practicable. Within the last five years every Staffordshire potter pronounced their adoption impossible. Since that time such advance had been made that some, at least, of the most strenuous opponents had confessed that their views were modified, and that for many classes of ware lead was no longer a necessity. Some went so far as to think that, with increased experience, leadless glazes might become available for nearly all kinds of goods. He was inclined to believe that such a result was only a matter of time.

The chairman (Professor John Thomson) said he was of opinion that the great variety of shades required by the public was responsible for the poisonous glazes. He trusted the public taste might be modified, perhaps on the basis of the old Eastern pottery, which was content with a more modest selection of colours. Manufacturers ought to be prevented from using glazes highly charged with lead for the sake of increasing their profits.

In the course of the discussion it was urged that the manufacture of ware with leadless glazes to any extent would not be advisable until the ware had been tested in trying climates like that of the Philippines. Doubts were expressed as to whether ware so made would stand the atmospheric conditions which prevailed in such parts of the world. It was also pointed out that workpeople were often habitually careless in observing Government regulations for their protection.

The Leeds Lighting Committee have decided to apply to the Government authorities for power to borrow £150,000 to extend the electric mains in the city, enlarge the present generating station at Aire-street, and to acquire additional machinery. This sum will meet the more pressing requirements for the next couple of years.

The celebrated Douglas collection of stained glass has lately been sold at Cologne for 180,000 marks. The three Holbein windows were purchased by the city of Basel for 30,000 marks. This rare and splendid collection of old stained glass was formed by the late Grand Duke Ludwig of Baden and Count Douglas.

The Finchley Urban District Council have decided to purchase two acres and a quarter of land upon which to erect 30 houses for the working classes, to be let at 7s. 6d. and 8s. 6d. a week. Half the land will be used for allotments until required for 30 more houses. Each dwelling will cost about £250 to build, and the ground will be intersected by a 40ft. road. The total cost is estimated at £8,000. The site decided upon is between East and Church End, Finchley, near where the Great Northern Railway Company are going to open a new station.

It is proposed to erect a Kursaal on the Harbour Parade, Ramsgate, in accordance with a scheme approved by the town council, and from designs by Mr. T. W. Cutler, F.R.I.B.A. On the ground floor there will be a buffet extending back from the parade a distance of 100ft. A second-class restaurant, to afford seating accommodation for 300 persons, will adjoin the buffet. Overhead there will be first-class dining or supper-rooms, consisting of a saloon and a number of smaller apartments. An assembly-room 100ft. by 70ft. will be situated on the ground floor to the west of the restaurant. In addition to a theatre occupying the floor above the banqueting-hall, there will be provided a roof garden in the Continental style.

## OBITUARY.

MR. TOM TURNER, A.R.I.B.A., of 18, Provost-road, Haverstock Hill, died on Thursday in last week at the early age of 32 years. Mr. Turner, who was the youngest son of the late Albert Turner, of Aldermanbury, E.C., and Sevenoaks, became an Associate of the Royal Institute of British Architects by examination in 1896, and had been a member of the Architectural Association for fourteen years past.

The death is announced from Manilla of a well-known American architect, Mr. WILLIAM C. SMITH, of Nashville, Tennessee. In his youth he fought in the Confederate Army, and again during the late Spanish-American War he saw active service as a colonel of volunteers, being sent to the Philippines on duty. During the attack on Manilla by the natives on Sunday, Feb. 5, Col. Smith was stricken with apoplexy, and died on the field. One of his most conspicuous works as an architect was a reproduction of the Parthenon, which was exhibited at the Art Building at the Tennessee Centennial Exhibition.

We regret to announce that the late managing partner of the Hathern Station Brick Co., Mr. JAMES FRANCIS HODSON, passed away on Tuesday, Feb. 28, after a very short illness, contracted whilst on business at Sunderland on the previous Wednesday, and was interred at Loughborough on the 4th inst. The business in all its branches—both at the Hathern Station Works and the Cliff Works—will be carried on as heretofore by the surviving partner and by his nephews, who have been associated with him in its conduct for several years.

MR. WILLIAM SHADDOCK, J.P., master builder of Saltash, and an alderman on the town council, died last week, aged seventy-one years. He was born at Bradninch, near Exeter, and went to reside at Saltash in 1854, being engaged by Mr. I. K. Brunel, the engineer of the Royal Albert Bridge, to superintend the excavations in the bed of the river for the pier foundations, and the erection of the masonry work. Upon the completion of that great undertaking, in 1859, Mr. Shaddock began business as a master builder, and obtained several contracts from the Great Western Railway Company for the construction of their stations, while he also built the Saltash Baptist Chapel, and restored the parish church and St. Stephen's Church. His connection with the Corporation of the borough dated back to 1869. In that year he was made a free burgess, and in 1875 appointed an alderman. He was three times elected mayor—namely, in 1876, 1877, and 1885; for three years he filled the office of chairman of the school board; and for a much longer period presided over the ferry committee. He was also for the past thirty years superintendent of the Baptist Sunday-school.

MR. ROBERT NEILL, the well-known Manchester contractor, died at his residence in Higher Broughton, on Sunday, in his 83rd year. Mr. Neill, who was mayor of Manchester for two years in 1866-7 and 1867-8, and high sheriff of Rutland in 1889 (in which county he had a seat near Wing), was a self-made man, being one of a large family of boys, who, in turn, as they grew up emigrated south from Moffat, Dumfriesshire. His first engagement on settling in Manchester was in the workshop of Mrs. Trees, joiner and builder in Strangeways. After occupying for some years the position of a foreman, he began business on his own account in the year 1842. His connection rapidly increasing, numerous additions were made to plant and works until the appliances and engagements of Robert Neill and Sons attained a place among the largest concerns of the kind in England. An early work carried out by the firm which attracted widespread notice from the rapidity of the operations was the erection of the Manchester Jubilee Exhibition of 1887. In 1852 he was elected on the town council as a representative of Cheetham Ward. Ten years later he was made an alderman, and in that capacity rendered conspicuous service to the corporation in its various departments—as chairman of the building and sanitary committee, and also of the cemetery committee, and on many other committees. During his several years of office as a mayor he laid the foundation-stone of the town-hall in Albert-square, of which Mr. Alfred Waterhouse, R.A., is the architect.

ANOTHER great contractor, Mr. GEORGE PEARSON, father of Sir Weetman Pearson, M.P., died on Friday at Brickendonbury, Hertford. He was

founder of the well-known firm of S. Pearson and Son, of Westminster, which had its origin at Scholes, and in former days the deceased resided in Bradford. The firm constructed the line of railway from Laisterdyke to the Lancashire and Yorkshire station at Bradford, which was made for the purpose of connecting with the Great Northern Railway at the Exchange Station. Mr. Pearson was the contractor for the waterworks and the great tunnel for the Bradford Corporation on Thornton Moor. The firm made the waterworks for the Dewsbury and Batley Corporation near Dunford Bridge; they built the Mirfield (L. and Y.) station; they sewered Southport and Tong; and the work of constructing the main sewerage of Ipswich was followed by the construction of the large Bentinck Dock at King's Lynn. Some sixteen years ago Messrs. Pearson and Son established themselves in London. They were largely employed upon work in connection with the docks at Milford Haven, and another big contract was that of the making of the great Mexican Canal, which was a contract of some millions in value. The firm is at present engaged constructing harbour locks at Vera Cruz. They were employed upon the construction of the Madrid and Portugal direct railway. Messrs. Pearson secured the contract for two railway tunnels two-thirds of the distance across the Hudson River, from Jersey to New York. The new Empress Dock at Southampton was another big achievement in the history of the firm. The firm are now working on the Admiralty harbour works at Dover. Six months ago the firm bought large cement works in Essex at a cost of £60,000. One of the large works under consideration is that of the railway in connection with the Great Northern and City Railway in London, which is to be built by a separate company, and the making of a dock and railways at Port Talbot, Glamorganshire, is another work with which the firm has been associated. Mr. Pearson, who was nearly 66 years of age, leaves a widow, three sons, and five daughters.

## CHIPS.

The rural district council of Tamworth have raised the salary of their surveyor, Mr. H. J. Clarson, to £400 per annum.

The fifteenth annual exhibition of the work done in the classes of the Home Arts and Industries Association will be held from May 1 to 15, in the gallery of the Royal Albert Hall. There will be exhibits from a large number of classes throughout the United Kingdom. The exhibition will include wood-carving, inlay, metal repoussé, embossed leather, spinning and weaving, and many other applied arts.

The contract for the county police buildings which are now being erected at Birkenhead has been let to Mr. P. McLachlan, whose tender was the lowest. The building will be erected of local stone, with red sandstone designs. The design is from the office of Mr. T. Taliesin Rees, A.R.I.B.A., which was selected in open competition.

The clergy and churchwardens of Dromore Cathedral, which is also the parish church, are appealing for subscriptions towards its enlargement, as also for the repair and renovation of the school buildings, for which purpose £1,300 is needed—£1,200 for cathedral, £100 (possibly more) for schoolhouse. The cathedral church of Christ the Redeemer was rebuilt in 1661 by Bishop Jeremy Taylor, whose remains, as also those of Bishop Percy, are interred in its vaults.

Mr. Ernest Crofts, A.R.A., has nearly completed his painting representing the opening of the Royal Exchange, which is to be placed by the Mercers' Company in one of the vacant panels of the ambulatory of that building.

A furniture repository has just been erected by Messrs. John Morton and Son, in Lincoln-street, Foleshill-road, Coventry. The building is of red brick, two stories high. It has a frontage of 70ft., and a depth of 150ft. The architect was Mr. T. W. Whitley, Coventry, and the builders were Messrs. J. Isaac and Sons, Foleshill.

A Sailors' Bethel on Battery-green, close to the fish markets, at Lowestoft, was opened on Thursday in last week. The buildings, which are of red brick, comprise a chapel 72ft. 6in. long by 36ft. wide, a schoolroom 35ft. by 20ft., with reading-room 20ft. by 15ft., and a room measuring 20ft. by 12ft. for small meetings. There is a large kitchen and lavatory. Accommodation is provided for 900 people. The heating is by hot-water apparatus. The cost of the building and land is about £4,420. Mr. F. W. Richards, of Lowestoft, was the architect, and Mr. C. R. Cole, of the same town, the builder.

## Building Intelligence.

**BELFAST.**—The foundation stones of St. Michael's Church were laid on Saturday in Craven-street, off Shankill-road. The cost of the entire structure when completed will be about £3,300. The dimensions will be 104ft. by 74ft. The church will accommodate between 700 and 800 people, while the plans provide for the erection of a gallery, which would seat about 150 more. The style is Gothic, and the material used in the walls is perforated brick, with Dumfries red sandstone dressings. The inside columns are to be of white Bath stone, and all the internal woodwork will be of pitchpine. The builder is Mr. James Kidd, and the architect Mr. Samuel P. Close, both of Belfast.

**BORDERSLEY, BIRMINGHAM.**—The Imperial Theatre, erected from plans by Messrs. Owen and Ward, of Birmingham, is approaching completion. The building has two frontages, one to High-street, of 104ft., and the other to Clyde-street, 134ft. There are arranged twelve exits from the various parts of the house, and each section of the building has at least two fireproof staircases. The grand hall leading to circle and stalls is 25ft. by 20ft., with staircases on both sides leading to the dress-circle. The domed ceiling of the hall will be decorated with hand-painted panels illustrative of Shakespeare's works, the walls will be lined with marble in parti-colours, and the floors paved with marble mosaic. The interior accommodation is classified into orchestra and pit stalls, pit, dress circle, balcony, and gallery, together with six private boxes, and will seat 2,500 persons. The auditorium is 69ft. by 65ft., and the stage is 69ft. by 40ft. The gridiron will be 50ft. above stage level. A green-room has been provided, and also dressing-rooms for both sexes. Both gas and electricity will be employed for lighting purposes throughout. The interior decorations will be principally of fibrous plaster in the Renaissance style, the prevailing colours being cream, blue, and gold; whilst the draperies and upholstery will be in old gold silk. The elevation to High-street is in red Ruabon brick, with buff terracotta dressings by Messrs. Doulton and Co., the two extreme angles being surmounted by square towers, finished with steep roofs, whilst a gabled pediment rises above the central entrance. The circle and gallery are supported on steel cantilevers, thus avoiding any obstruction in the shape of iron columns, &c. There will be a fireproof curtain to the proscenium opening.

**EDINBURGH.**—At the last Dean of Guild Court a warrant was granted to Brighton-street E.U. Congregational Church Trustees to take down houses and erect a chapel at 1 to 4A, Bristo-place. The building, which will be Early Renaissance in style, and will recall certain features of the old Tron Church, is expected to cost about £3,000. The frontage will be to Bristo-place, and the church proper will be on the first floor, which will be reached by a wide staircase. It will be seated to hold 510 people, and there will be galleries at the two sides, besides an organ-loft. On the ground floor will be a hall, which will accommodate 170 people. There will also be a class-room and a vestry, and the remainder of the frontage of the site will be used for shops. The basement floor will contain a luncheon-room, a ladies' room, and offices. The front is to be divided into four bays, panelled with fluted pilasters, which will carry Ionic caps. Three-light windows will be inserted with semi-circular heads, and these will be filled in with tracery of the period. The front of the building will be accentuated by a gable, in the centre of which will be a rose window. Red polished stone will be used. The heating will be by hot pipes, and the building will be lit by electricity, the ventilation being by an electric fan. The architects are Messrs. Sydney Mitchell and Wilson, Edinburgh.

**HANDFORTH, CHESTER.**—On the 3rd inst. the new parish church of St. Chad, Handforth, was consecrated by the Bishop of Chester. The new building takes the place of a church built about 50 years ago, and found to be unsuited to the present requirements of the parish. The style of the new church is 15th Century, with modern detail. The walls are faced with red brick, with Alderley stone dressings to windows, doorways, and buttresses. The roof is covered with Staffordshire tiles of a dark brown colour. The interior woodwork, including the open-timbered

roof, is of pitch-pine. The accommodation is for 300, and the total cost about £4,000. Mr. Thomas Browne, of Chester, is the builder, and the work throughout has been carried out from the designs of Mr. John Brooke, A.R.I.B.A., of Manchester.

**LEVENSHULME.**—The new offices of the urban district council in Stockport-road, Levenshulme, were opened on Friday. The building has a frontage of 75ft. to Stockport-road, the front being of Ruabon brick, with Derbyshire stone dressings. A 10ft. wide entrance opens upon an octagon hall, which is 15ft. across. The council chamber and all the offices—including accommodation for the clerk, the surveyor, overseers, and sanitary inspector—and also a committee-room, are reached from this hall, and behind are the caretaker's house, the stables, sheds, and a town's yard. A wide staircase leads to a public hall, 72ft. by 40ft., provided with two retiring-rooms. The electric light is installed throughout. The building was designed by the council's surveyor, Mr. James Jepson, of Stockport, and the total cost has been about £6,000.

**MIDDLESBROUGH.**—New premises for the Co-operative Society in Linthorpe-road, Clifton-street, and Pelham-street were opened on Friday. They cover an area of 6,573sq. ft. The main frontage of 87½ft. is into Linthorpe-road, and is divided into four large shops. The corner shop is occupied by the grocery department, by the drapery, shoes, and butchering departments. The three first named have a depth of 52ft., the walls and ceilings are of pitch-pine, and the floors are laid with wood blocks in cement concrete. The butcher's shop has a depth of 45ft., has a high dado of glazed tiles, and the upper part is faced with white glazed bricks. The floor in this shop is of cement concrete. The height of the ground floor story is 14ft. Immediately to the rear of the shop is a carriage-way, 14ft. wide, with the entrance in Clifton-street, and an exit into the back passage leading direct into Pelham-street. On one side of this carriage-way is a raised platform, 40ft. by 6ft., upon which goods are delivered ready for putting by lift into the various warehouses. The cellar for the grocery department is 48ft. by 40ft. Adjoining this, but at the ground-floor level is a drapery warehouse, 40ft. by 12½ft., a boot warehouse, 29ft. by 12ft., and a grocery warehouse, 48ft. by 40ft. On the first floor are the showrooms, 51ft. by 48ft., and 44ft. by 17ft. respectively. On the second floor is a public hall, 67½ft. by 52ft., with retiring rooms. The three street elevations are faced throughout with the Accrington red pressed bricks, and the dressings are of stone, with a small amount of terracotta. The architect is Councillor W. G. Roberts, of Albert-road, Middlesbrough. The contractors were:—Excavating, bricklaying, masonry, &c., Messrs. W. and H. Pounder, Middlesbrough; plastering and cement concrete work, Mr. J. R. Smiles, Middlesbrough; carpentry and joinery, Mr. W. Thompson, Middlesbrough; slating, Mr. J. Harrison, Middlesbrough; plumbing, glazing, and gasfitting, Messrs. Baker Bros., Middlesbrough; and painting, Mr. J. H. Hill, Middlesbrough. An installation for electric light and power has been put in, capable of running 800-light candle-power lamps.

**MURRAYFIELD, EDINBURGH.**—On Saturday the Scottish Episcopal Church of the Good Shepherd, Murrayfield-avenue, was consecrated by Bishop Dowden. The church at present consists merely of nave and chancel, with vestries, &c. Ultimately a north aisle and organ transept will be added, and a square tower will be carried up over the vestry. The nave is treated with the utmost simplicity, and consists of five bays with plain barrel wood roof. On the north side is the arcade to the future aisle. The pulpit is in the north-east corner of the nave, and is of oak, with linen fold-paneling on the wall behind. The reredos, reaching 15ft. up from the floor, is in the form of a triptych, the centre panel being carried up above the rest. It is surrounded by a pierced and carved frame, with the dove in a halo of rays at the apex, flanked on each side by angelic figures. At the sides are green stamped velvet wings hanging from iron rods. In the centre light of the east window is the Crucifixion. The background is filled with diapered lattice glass. The heads of the sidelights contain the sacred initials on crowned shields within wreaths. At the base of the window are four crowned shields with the symbols of the Passion. Mr. R. S. Lorimer, of Edinburgh, is the architect.

**YORK.**—In his annual report the building in-

spector states that in the west division of the city there has, during 1898, been a small increase in the total number of dwelling-houses completed, but the number of better-class dwelling-houses far exceeds that of previous years. There has been a good demand both for purchase and occupation. The districts where the better-class dwellings have been built are Scarcroft and Holgate. Of the cottage class a large number have been built in the Leaman-road district. Upon the new estate recently opened out on Bishopthorpe-road great activity is being displayed, and the demand for the smaller class of houses is great. The North-Eastern Railway Company have built large additions to the workshops at Holgate, which will provide room for the employment of several hundred additional workmen. On the east side of the city 265 dwelling-houses, mostly of the small and middle class, have been built. Plans have been approved for new streets on Falford-road, Hull-road, Haxby-road, Huntington-road, Heworth, Park-grove, and Barton Stone-lane. Many large additions and alterations have also been made to business and other premises.

### CHIPS.

At Stirling, on Saturday, new co-operative premises in King's-street, erected from designs by Messrs. McLuckie and Walker, were formally opened.

At the Royal Pavilion, Brighton, on Wednesday week, Colonel J. T. Marsh, R.E., held an inquiry on behalf of the Local Government Board with reference to the application of the town council for sanction to borrow £15,000 for works of street improvement.

A pavilion is being built in the Nevill Athletic Ground at Tunbridge Wells. The structure is of half-timber on a foundation of brickwork and is tiled, the dimensions are 38ft. by 20ft. Mr. C. H. Strange, A.R.I.B.A., is the architect, and Messrs. Strange and Sons, of the same town, the are builders.

Mr. Robert H. Reed, the borough surveyor of Lostwithiel, has secured an appointment as superintendent of the building of new wings to the Hampshire County Asylum, at Knowle, near Fareham, now about to be carried out at a cost of £26,000.

A Jubilee clock, having three 8ft. dials, has been placed on the tower of the parish church of Eccles-hall. It was constructed by Messrs. J. B. Joyce and Co., of Whitechurch, Salop.

In our notice last week, p. 321, of the New Year Book of the Society of Architects, one of the recently formed committees was described by a printer's error as having for its object the testing of "methods," in place of "materials."

Within the past three months a notable improvement has been carried out by the Epping Forest Committee of the City Corporation. What was formerly known as "the hollow pond" has been excavated, while the swamps surrounding it have been cleared, and the space obtained added to the lake itself. In consequence, the lake now extends to close upon five acres, and artificial islands have been formed at various points.

Mr. F. W. Stevens, C.I.E., F.R.I.B.A., &c., has been appointed arbitrator under the Municipal Act by H.E. the Governor of Bombay, with the concurrence of the corporation, to fix the ratable value of buildings and lands in the city of Bombay vesting in her Majesty and beneficially occupied.

A two-storied ward block is being added to the Royal South Hants Infirmary at Southampton, and will be opened in the autumn. It will contain two wards of 25 beds each, two single-bedded receiving wards, ward kitchens, &c. Adjoining it a new mortuary with post-mortem room and students' museum is in course of erection. Messrs. Playfair and Toole, of Southampton, are the builders, having taken the contracts at £9,680 for the ward block, and £1,400 for the mortuary.

The Co-operative Society's premises at Thetford, erected fifteen years ago, have just been enlarged. A house adjoining the store has been pulled down, and on its site has been erected a shop 50ft. long by 27ft. wide, with a room above of the same dimensions. There is now a total shop-frontage of 49ft. The plans and specifications were prepared by Mr. J. Osborne Smith, F.R.I.B.A., of London, and the work has been carried out by Messrs. E. Willmott and Sons, of Cambridge, at a cost of about £1,300.

At the Public Offices, Grassendale, Colonel A. J. Hepper, D.S.O., R.E., an inspector of the Local Government Board, has held an inquiry into the application of the Garston Urban District Council for sanction to borrow £1,000 for works of sewerage at Mossley Hill, where Messrs. Roberts and Co., Liverpool, are making great developments, and it is expected that 500 or 600 houses will be erected at an early date.

## Our Illustrations.

THE CROWN THEATRE, PECKHAM.

We published a perspective view of this important addition to the playhouses of London in the BUILDING NEWS for April 29, 1898, when we gave a plan of the building. The great feature of the arrangement is the unusual width of the stage, which is 140ft., so contrived as to lend itself to spectacular effects. The saloons have been well-arranged, and the decorations are of a thoroughly substantial and handsome kind. The retiring and dressing-rooms are hygienic and ample. Mr. Edwin O. Sachs has written a descriptive account of the work, of which, as an authority on theatres, he entirely approves. He says that the exterior, treated in a style of the Spanish Renaissance, he considers admirably adapted to the purposes of such a building, while the materials, i.e., brick and terracotta, are equally suitable. He warmly refers to the decorations, which embody suitable references to the name borne by the establishment—viz., the "Crown" Theatre. We give to-day Mr. Charles Buchel's four panels representing the colonies "India," "Africa," "Australia," and "Canada." The same artist painted the frieze over the proscenium of the house, as well as the spandrels illustrating "Art," "Music," "Drama," and "Poetry." The general interior photographic view shown on our plate gives the grand circle foyer, from a silver print by Messrs. Bolas and Co. Messrs. Dennett and Ingle did the constructional ironwork, the terracotta was made by Messrs. Doulton and Co., Messrs. Strode and Co. provided the electrical installation, and Messrs. G. Jackson and Sons the plastic decoration. Mr. Ernest Runtz, F.R.I.B.A., is the architect; Messrs. Colls and Son were the builders.

ST. MARY'S CHURCH, STRETTON-CUM-WETMORE.

The church of St. Mary at Stretton, consecrated in November, 1897, is one of the few modern churches which have been completed in furniture and decoration under the direction of the architects. It is the gift of Mr. John Gretton to his native parish, and replaces a very poor building, which, though only about sixty years old, was already worn out. On the site of its altar there now stands a tall churchyard cross, with a suitable inscription. The new church is built on an extension of the churchyard, a little to the north-east of the old one, and, being on a slightly rising ground in a generally flat country, is conspicuous for miles round. The church is entirely of ashlar, the outside is of Stanton stone, very hard and durable, and the inside of Runcorn. The upper roofs are covered with tiles, and the lower with

copper, and the down-pipes of cast lead are made a feature in the design. All the roofs are ceiled, and decorated with painting. The east window and those north and south of the sanctuary have painted glass, and the architects consider that more than this is not wanted. The other windows have white glass, a little ornament being used in the leading. The font, which forms one of the illustrations, shows the character of the furniture. The font and steps are of Frosterly marble, and the cover of dark oak, as also are the screens, chancel fittings, pews, and other joiners' work. The organ has a richly-carved case, which projects into the chancel from a gallery above the choir vestry; the front pipes are gilt. The instrument is played from a console in the south chapel. The church is lighted by oil-lamps hung from the roof. The altars have costly furniture. The intention has been that everything should be of the best, and many men have contributed to make it so. The contract work is by Mr. Halliday, of Stamford; the oak furniture by Mr. J. E. Knox; the stone carving by Mr. Bridgeman, of Lichfield; the painted decoration by Mr. Charles Powell; the more important metalwork by Messrs. Barkentin and Krall; the marble-work by Messrs. Farmer and Brindley; the curtains by Messrs. Morris and Co.; and the embroidered work by Messrs. Watts and Co. Mr. Roscoe Mullins has done statues of the patron saint and of St. Chad, and the stained glass is by Sir William Richmond. The church is seated for 280 people, and it has cost about £32,000. The architects are Messrs. J. T. Micklethwaite and Somers Clarke.

COTTAGE HOMES, STYAL, CHESHIRE.

The group of buildings herewith illustrated has been erected for the Chorlton Union. It comprises a lodge at entrance, which is used as a quarantine station, homes to accommodate 20 children in each, Kindergarten school, workshops, bakehouse, swimming bath, &c. (in the rear of the site), a hospital built for 16 beds, with accommodation for nursing staff, superintendent's house, and boardroom. The large school, of which a view is shown in the corner of our plate, is situated about half a mile from the homes, and will eventually be attended by the village children. The works were commenced in the spring of 1896, and opened at the beginning of October last, the amount of the contract being rather over £50,000. The homes at present provide accommodation for 310 children, but the offices and school are built for an ultimate population of from 500 to 600. Mr. James B. Broadbent, A.R.I.B.A., of Manchester, is the architect.

NEW TOWER AND SPIRE, ST. PETER'S CHURCH, ANDERLECHT.

The collegiate church of St. Peter, at Anderlecht, a suburb of Brussels, was commenced in 1470 and consecrated in 1482. On September 19, 1898, the new stone tower and spire, shown in our illustration, were inaugurated, having been completed from the designs and under the superintendence of M. J. J. Van Ysendyck, architect, 109, Rue Berckmans, Brussels.

TWO CHIMNEYPICES.

The sketches we publish to-day are of two chimneypieces designed by Mr. H. Percy Adams. One has a specially-designed faience stove, and the chimneypiece and all the surrounding panelling and woodwork are painted a dull green. There is a small painted glass window on either side of ingle nook, the one on the north representing the wind, and the one on the south representing the sun. They were designed by Mr. Wilson, and executed by Messrs. Simpson, and are of a yellowing-brown tone. The chimneypiece, with dog-grate, as well as all the panelling, cosy corner, and cabinet, were executed in American white wood, with polished mahogany shelves, and all except the upper part of shelves is enamelled cream white. The paper is a dull grey-green, designed by Mr. Walter Crane, and the frieze was all modelled *in situ* by Messrs. Elmes, and represents music, and is coloured a warm cream colour, and is about 4in. in relief. The lighting of this room is from 12c.p. electric lamps fitted into the ornamental plasterwork of the ceiling.

SCREEN IN YORK MINSTER.

This screen is next the choir, but not in a very good position to be seen. It has been very well executed, and is in a very good state of preservation, being almost entire. The drawing given is by Mr. J. Douglas Trail, of Edinburgh.

THE "SCOTSMAN" BUILDINGS, EDINBURGH, N.B.

IN connection with the extensive scheme of municipal improvement which is being given effect to in Edinburgh, a notable change is being made in several historic districts, which will contribute much to enhance the appearance of the city. Part of this scheme involved the building of a new bridge spanning the valley which divides the old town and the new, and to meet the requirements of a wider bridge, the municipality has, under rights granted by Parliament, bought up the property on both sides of the street forming the connection between the old town and the new bridge. The cost to the corporation was close on £350,000. Both sides of the street were recently exposed for sale, and the west side was purchased by the proprietors of the *Scotsman* for £120,000, the east side being purchased partly by the Commercial Bank of Scotland, and partly by Mr. John White as a speculation. The illustration in last week's issue showed the frontage overlooking the Princes-street valley. The foundations of the main building are on the level of Market-street, 60ft. below the level of North Bridge. At Market-street the frontage is over 250ft., in front of which is the Waverley Station. The whole of the street at the low level will be excavated 35ft. to the railway level. This will permit of the railway lines being run direct to the stores under the street level for the delivery of paper, machinery, &c. These stores have an area of over 20,000sq.ft. On the ground floor at Market-street level there will be the machinery hall, stereotyping and mailing rooms, occupying an area of over one-third of an acre. The floor above is occupied by the Linotype composing room. On this floor accommodation is found for the artists employed, and a matrix room, where the papier-mâché matrices will be prepared from the finished pages previous to being passed down to the stereotypers on the floor immediately beneath. Above the composing room come the editorial rooms of the *Scotsman*, the *Evening Dispatch*, and the *Weekly Scotsman*, and a large library and reference room. Above these again, on the fourth story, are the editorial rooms of the *Scotsman*. The fifth floor opens on the North Bridge, one of the principal arteries of this city. On this level are located the commercial and managing departments of the establishment, in immediate touch with the public, and with a commanding outlook towards Princes-street. On this frontage will be arranged the advertising office, an apartment with an area of 2,800sq.ft., with a height of nearly 30ft., with galleries running round the four sides. The remaining stories above the North Bridge level, of which there will be five, will be fitted up as offices, and can at any future period be absorbed for the requirements of the newspapers. The plans of the whole of the west side are being prepared by Messrs. Dunn and Findlay, architects, Edinburgh. The total cost will be close on £500,000, including the site.

\* \* \* THE photographic processes of reproduction are now so available that we venture to suggest that in many cases it is hardly worth while to send us drawings for reproduction. For measured work, for details, competitions, and the like, the services of the draughtsman will, of course, always be indispensable; but for average executed buildings, statuary, furniture, &c., a photograph is frequently in every respect as useful; and as, generally speaking, it would occupy less space, we should be able to give more subjects—especially in cases where the indifference of the drawing not infrequently influences the rejection—of churches, chapels, villas, &c.

## ROYAL ACADEMY ARCHITECTURAL DRAWINGS, 1899.

THE days for sending in drawings and paintings this year have been fixed for March 24 and 25, the last day being Monday, the 27th. Sculpture will be received on the 28th.

Our friends and contributors who are willing to allow us to reproduce their drawings before they are sent to Burlington House, so that their works may be included in our series of illustrations from the Royal Academy Exhibition, to be published after the opening day, are invited to let us have them as soon as convenient for this purpose. We will return the drawings quickly, or, if desired, we are willing to forward them to the Academy direct, provided the necessary labels and letters to the Secretary are attached; and we will do this free of charge.

## UNITED METHODIST FREE CHURCH — ARMLEY.

WALTER HANSTOCK & SON  
ARCHITECTS

ROGER OLDHAM DELT. 1898.

UNITED METHODIST FREE CHURCH,  
ARMLEY.

THIS building, at Armley, Leeds, is intended to be built in Leeds red pressed facing bricks, with Park Spring ashlar dressings. The roofs are intended to be covered with best quality blue slating. The internal fittings are to be in pitch-pine and mahogany, and the ceilings and walls are in fibrous plaster decorations and plain filling. The size of the chapel is 57ft. by 44ft. and 26ft. high. It has a spacious organ chamber, large classroom, ministers' vestry, back entrance, with necessary conveniences. The only accommodation provided for in the way of gallery is at the end

over the front vestry, with two stairs constructed in the corner tower. The whole of the works have been recently let and the work is in hand. The total cost, including all decorations and fittings, engineering, &c., will be £2,653, exclusive of land. Messrs. Walter Hanstock and Son are the architects.

The Baptist chapel at Warboys, Hunts, was opened on Thursday in last week, after reconstruction from plans by Mr. Frederick G. Faunch, of Ilford, Essex. It is now 13th Century in style, and is faced with red brick and stone dressings. Messrs. G. Page and Son, of Buckden, Hunts, were the builders.

The West Lancashire Rural District Council have appointed Mr. John Orliott, at present surveyor to the Southport Highway Board, about to be dissolved, as surveyor to the Southport district, and Mr. William Banks as surveyor for the Tarleton district.

New board schools, including the provision of a swimming-bath, are about to be built at Long Eaton, from plans by Mr. E. R. Ridgway, of that town.

The additions to the Fever Hospital, Bolton, are being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke-flues, Shorland's patent exhaust roof ventilators and inlet panels.

## Engineering Notes.

**MERSEY DOCK IMPROVEMENTS.**—The Mersey Docks and Harbour Board have, after two prolonged debates, adopted recommendations of the works committee as to carrying out (at an estimated cost of £885,335) certain of the great works provided for in the Act obtained last year, the borrowing powers under which approximate to five millions. The instalment now to be proceeded with comprises the construction of a new branch of the Huskisson Dock, with double-story flat-roofed sheds (capable of being converted into three or four-story sheds if necessary) on the north and south sides, at an estimated cost of £482,782; the construction of a graving dock, 1,000ft. long and 95ft. entrance, to the south of the above-mentioned branch dock, and to cost £202,813; and the provision of a new quay on the north side of the Sander dock, in connection with the foregoing works, with a two-story flat-roofed shed, at a cost of £199,738. The committee also advised some variation in the scheme for the New Queen's graving dock, 630ft. long and 80ft. wide at entrance. The controversy at the board has been almost entirely devoted to the sheds. While the committee advised two-story flat-roofed sheds, on the top of which cranes could work, some members advocated three stories and others four stories. The scheme as adopted will give 32 acres of shed space, and will be capable of accommodating 160,000 bales of cotton or 160,000 tons of grain at one time. The addition of more stories was advocated on the plea that it would afford more room for sorting cargo, while it was contended that the flat-roofed system, with its stores and cranes, involved darkness for the room below. An amendment in favour of an experimental three-story block of sheds was defeated by 16 votes to six, and the committee's scheme was adopted. The sheds are not to be warehouses, but temporary repositories for goods in transit.

Additions have been made to the joint infectious diseases hospital at Bucknall, near Stoke-on-Trent, at a cost of £5,170. Mr. Elijah Jones, M.S.A., Albion-street, Hanley, was the architect.

M. Sedelmeyer has presented to the Louvre Gallery in Paris a portrait of Lamartine, by the English painter Henry Wyndham Phillips. The portrait has been hung in the English Gallery.

The urban district council of Connah's Quay have adopted plans for draining the town prepared by Mr. Beloe, C.E., of Liverpool. The estimated outlay is £6,000.

The parish church of West Stafford, Dorset, has just been enlarged by an eastern extension, and the older portion of the fabric has been restored. Mr. C. E. Ponting, F.S.A., of Marlborough, was the architect, and Mr. Haskings, of Hungerford, the builder. Within the chancel under a window just filled with stained glass, representing the Resurrection, the work of Messrs. Burlison and Grylla, of London, a memorial tomb of the late rector, the Rev. Canon Reginald Smith, bearing a recumbent figure of the deceased, has been erected. It has been executed by Messrs. Harry Hems and Sons, of Exeter.

The Light Railway Commissioners held an inquiry at the town-hall, Bilston, on Friday, respecting an application of the British Electric Traction Company as to the construction of light railways in South Staffordshire, including Bilston, Willenhall, and Darlaston.

At Edgbaston, Birmingham, thirteen villa residences are in course of erection. Each house has three reception-rooms, large kitchen, &c., seven bedrooms, bath-room, linen-closet, and all the conveniences required in a superior class of house. At Sheldon, about five miles from Birmingham, six commodious villas have been completed. At Knowle, about nine miles from that city, a number of conveniently-arranged cottages are being erected, to open up a building estate of about six acres in extent. All the buildings are Gothic in style, and are being erected by various contractors. The architect for the whole of these erections is Mr. John Statham Davis, of Cobden Buildings, Corporation-street, Birmingham.

Mr. Justice Lawrence, on Tuesday, unveiled a stained-glass window erected in York Minster as a memorial of the late Sir Frank Lockwood, who represented the city in Parliament for 12 years. The memorial represents the figure of St. Paul, and is a reproduction of a window which, according to "Torr's Manuscript of York Cathedral," formerly occupied the same position in the eastern aisle of the north transept. Underneath it, engraved on a brass tablet, is an inscription written by Earl Rosebery.

## PROFESSIONAL AND TRADE SOCIETIES.

**THE AUCTIONEERS' INSTITUTE.**—The spring provincial meeting of the Auctioneers' Institute was opened at Derby yesterday (Thursday), and will be continued to-day. The council and members were received yesterday in the Guild-hall by the Mayor (Alderman E. T. Ann), after which the general business of the Institute was transacted by the council. The arrangements for the meeting are being carried out by a representative local committee, drawn from the surrounding counties of Derby, Nottingham, Leicester, and Stafford, with the Mayor of Derby at its head. Visits will be paid to-day to the Royal Crown Derby Porcelain Works, the locomotive works of the Midland Railway Company, and the new Technical College at Derby; also to the extensive cooperage, maltings, and brewery of Messrs. Bass and Co., at Burton-on-Trent. This evening there will be a dinner at the Royal Hotel, Derby, when the president of the Institute, Mr. Alderman Dobson, will occupy the chair, and will be supported by the mayor and other members of Parliament, many of the leading professional and commercial men of the town and district, and the members of the council. The Institute now numbers considerably over 1,000 members.

**EASTBOURNE MASTER BUILDERS' ASSOCIATION.**—At the annual meeting of the association held at Hermitage's Rooms on Feb. 28, the report and balance-sheet for the past year were received and adopted, with thanks to the retiring officers. The committee for the year was elected as follows:—Mr. Joseph Martin, president, re-elected; Mr. E. Cornwell, vice-president, re-elected; Messrs. M. Martin, Stanbridge, Winter, Breach, Miller, Bainbridge, and Lacey. It was unanimously decided to join the S.E. Counties Building Trades Employers' Federation.

**SCOTTISH ARTS CLUB.**—The annual meeting of the Scottish Arts Club was held on Saturday night in the club-rooms, Rutland-square, Edinburgh. Professor G. Baldwin Brown, Hon. A.R.I.B.A., the retiring president, occupied the chair, and there was a large attendance. The reports submitted by the hon. secretary and hon. treasurer showed the club to be in a flourishing condition. The number of members at present is 236, and there is a substantial balance at the credit of the funds. Mr. W. D. McKay, R.S.A., who has been hon. secretary of the club for many years, was elected president; Professor Masson and Mr. Cox, M.P., were re-elected vice-presidents; Mr. Daddington Herdman was elected hon. secretary, and Mr. G. Stratton-Ferrier was re-elected hon. treasurer. It was agreed to have exhibitions of the works of artist members in the club-rooms twice a year. A hearty vote of thanks was given to Professor Baldwin Brown for his services as president for the last four years.

A tower and spire are about to be added to St. Patrick's Roman Catholic College Church at Maynooth, from designs by Mr. William Hague, of Dawson-street, Dublin.

The Lowestoft Town Council have accepted tenders for machinery, underground mains, road work, and are lamps, amounting in all to £16,892, and have resolved to apply to the Local Government Board for sanction for a loan of £30,000.

On Saturday the Highland District Committee of Perth County Council authorised the adoption of a scheme for a new water supply for Dunkeld special district, as prepared by Mr. Thomson, C.E. The Duke of Atholl has granted permission for the water to be taken from Loch Ordie burn, the amount required being about 45,000 gallons daily. The scheme includes the building of a reservoir to store 500,000 gallons, which will also serve as a filter by allowing the sediment to fall to the bottom. The estimated cost is £1,800.

At the Village Hall, High-street, Orpington, on Thursday in last week, the Earl of Jersey (chairman), Colonel Boughey, and Mr. Gerald A. R. Fitzgerald, Light Railway Commissioners, held a Board of Trade inquiry as to the expediency of granting the application made by the Orpington, Cudham, and Tatsfield Light Railway Co., Ltd., for an order to authorise the construction of a light railway. The engineers for the promoters, Messrs. Stephens and Burdall, of London, explained that the proposed line was  $7\frac{1}{2}$  miles long, and was estimated to cost £63,000; the gradients were heavy, the steepest being 1 in 40, and there would be two intermediate stations. The commissioners intimated general approval of the scheme.

## COMPETITIONS.

**DARTFORD.**—The School Board met on Thursday, the 2nd inst., to receive the award of the assessor, Mr. W. Harston, on the designs entered for new schools in York-road. The assessor reported that he had carefully gone into the merits of the twenty-six sets of designs sent in, and he awarded the premium of 30 guineas to the design marked "School," and the second premium of 10 guineas to the one marked "Omdurman." The competitor who won the first premium is Mr. Henry Hall, F.R.I.B.A., of Doughty-street, Mecklenburg-square, W.C., and the winner of the 10 guineas is Mr. G. H. Tait, M.Inst.C.E., of Dartford. It was decided to publicly exhibit, at the board's rooms in Spital-street, on Wednesday and Thursday in the past week, the whole of the perspective drawings sent in, together with the ground plans of the successful competitors. The clerk was directed to intimate the result of the competition to the winners of the premiums, and to return, after the exhibition, the other designs to their authors; also to invite Mr. Hall to an interview with the board for the purpose of ascertaining whether he will prepare detailed specifications prior to the forwarding of his plans and designs to the Education Department for approval. The board further directed the clerk to insure the plans for one month at £1,000, and to return to those architects who sent, or send, back plans and conditions, their deposits of a guinea each.

The Police Commissioners of Stirling have been authorised to borrow £25,000 for the purposes of the electric lighting scheme of the burgh.

Mr. E. Onslow Ford, R.A., has had the honour of submitting, for the Queen's inspection, a model of the statue to commemorate her Majesty's Diamond Jubilee, which is to be placed in front of the municipal buildings at Manchester. Mr. Ford also submitted a marble bust of the Queen, which he has executed for her Majesty.

The Royal Commission on the London Water Supply sat on Monday and Tuesday, and concluded the hearing of evidence on behalf of the companies. They adjourned on the latter day until next Monday, when the examination of witnesses will probably be concluded.

The Dean of St. Paul's has consented to a memorial of the late Mr. George A. Spottiswoode being placed in St. Paul's Cathedral by the 6,000 Communicant members of the Lay Helpers' Association for the Diocese of London, of which he was for 22 years the chairman.

A lengthy report upon the question of the erection of artisans' dwellings by the corporation of Coventry has been prepared by the city engineer, Mr. J. E. Swindlehurst, and is under consideration by the artisans' dwellings committee.

The South Stoneham Highway Board decided, at their last meeting, to raise the salary of their surveyor, Mr. J. Cudlipp, from £140 to £200 a year. Mr. Cudlipp had just returned to work on the day of the meeting, having just practically recovered from a recent accident sustained while in the discharge of his duties, whereby his right ankle was broken.

The Court of Appeal decided on Monday that when an appeal was entered in a case under the Workmen's Compensation Act, and the party appealing had no means to meet the costs, should he be unsuccessful, they would order security to be given. If, however, an appellant could appeal *in forma pauperis*, then the case would be heard without security being given.

Mr. Case, C.E., who has carried out similar work at Cromer and Dymchurch, is erecting several groynes at Blackpool on the North Shore, opposite the Gynn estate, for its owners. The groynes, which are made of wood, run out to low-water mark, and are easy of construction, as much as 600ft. being put down at one tide. The corporation had proposed to construct them from south to north, and so lessen the work in connection with the promenade widening by accumulating sand, but this proposal was dropped, and they are now to be only erected opposite the new North Shore works.

An anonymous donor has presented a new illuminated turret Cambridge quarter-chime clock to the Leeds parish church, showing the time upon four external dials 8ft. each in diameter, which are lighted by electricity turned on and off by an automatic arrangement connected with the clock. The hours are struck on the tenor bell of 36cwt., and the chimes on four smaller bells. The makers are Messrs. W. Potts and Sons, clock manufacturers of Guildford-street, Leeds, who have carried out their work from instructions received from Mr. C. R. Chorley, J.P., F.R.I.B.A., architect, Leeds, one of the churchwardens.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 33fr. 30c.) To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

## NOTICE.

Bound copies of Vol. LXXV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXI., XXXII., XXXIII., XXXIV., XXXIX., XL., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., LII., LIII., LIV., LV., LVI., LVII., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., and LXXV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

YOUNG INQUIRER.—(If you send a stamped envelope to the Secretary of the Royal Institute of British Architects, 9, Conduit-street, you will get the Institute scale of charges for architects. What a "Building Inspector" who "can only visit the job before office hours" is entitled to charge we cannot really say.)

RECEIVED.—W. H. and Co.—S. M. (Bradford).—R. K. L. Co.—F. N. M. (Salop).—J. G.

## "BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Le Nord," "McGilligan," "Butts," "Tokio," "Vulcan," "Quadrant," "Rikki," "Scruton," "Thistle," "First Attempt," "Vigornia," "Quercus," and "Pup."

## QUESTIONS.

[12205.]—**Measuring and Estimating.**—Is there any recent work on estimating and the processes employed to analyse items? Most books give no information on these details.—K. O.

[12206.]—**Light Areas.**—Which is the best kind of reflector for reflecting the light through windows at the bottom of a light area five stories high?—OFFICE.

[12207.]—**Deal Architrave Moulding.**—What is a fair price for a moulded architrave 2in. by 4in.? Should it be taken at per foot run or superficial, measuring the moulded edge?—STUDENT.

[12208.]—**Dilapidation.**—Is a covenant to repair satisfied by the tenant keeping the house wind and watertight and in painting and papering? If a roof is so bad that it cannot be kept weather-tight, is the tenant obliged to put in repair? The roof is very old and decayed.—A LESSEE.

[12209.]—**Stiffening Floor.**—An old floor sags several inches in centre, and any heavy treading or dancing causes it to shake very much. Is there any inexpensive way of strengthening the joists without placing a beam underneath? Practical answers will be thankfully received.—ANXIOUS.

## REPLIES.

[12200.]—**Walls.**—If you build up walls of two half-bricks, leaving a 4in. cavity in the centre, filled in with White's hygeian rock building composition, you will

secure a wall of double the strength of those built in the ordinary way, besides rendering it weather and damp-proof. I have used it on several occasions, and it will not fail.—BUILDER.

[12200.]—**Walls.**—I should advise "Cheltenham" to build the walls of his villa hollow, and for a house of ordinary size, the walls may be 16in. walls, with the 9in. thickness inside if the timbers are heavy, and a 4in. thickness outside. But if only two stories, I prefer the greater thickness to be put outside. A 16in. wall allows a 2½ cavity. The two walls should be bonded together by vitrified bricks made for the purpose, or by galvanised iron cramps placed about 2ft. 6in. apart, every fifth and sixth course. If the walls are faced with superior bricks, the plan of having the 4in. outside may be best. If solid walls are preferred, there may be a sheeting of bitumen, such as Callender's Pure Bitumen, laid behind the facing as the work proceeds, especially if dampness is feared; or the walls may be built in cement mortar.—G. H. G.

[12201.]—**Building Construction.**—"M. G. S." had better write for information to the Science and Art Department, South Kensington. I believe it is not necessary to have attended the elementary stage.—A. B.

[12202.]—**Ink-Marks in Books.**—Ink-marks in books can be removed with oxalic acid and lime.—LIBRER.

[12204.]—**Westmoreland Slates.**—Some very nice toned sea-green slates are obtained from Tilberthwaite, near Coniston, close in texture, and which do not discolour. Green slates are often porous. There are "bests," "seconds," "thirds," &c. The best slates are of varying lengths—12in. to 30in. Write for particulars to quarries.—A. G. S.

## LEGAL INTELLIGENCE.

**HORSHAM BUILDERS' AFFAIRS.**—Loss of £12,000 ON ROEDEAN BUILDINGS.—At the sitting of the Brighton Bankruptcy Court last Thursday week, before the Registrar (Mr. A. O. Jennings), Peter Peters, of The Cedars, and Thomas S. Peters, of 9, Bartlett-road, East-street, trading as P. Peters and Sons, at East-street, Horsham, builders and contractors, appeared for their public examination. In reply to the Official Receiver (Mr. Howard Cox), Peter Peters said he was brought up as a bricklayer, and began business as a builder at Horsham twenty-five years ago without capital. He gradually improved his position, and for years had been in the habit of taking considerable contracts. He did a good bit of speculative building in the early part of his life at Horsham. Four years ago he went into partnership with his son, a draft partnership agreement being entered into. The capital he had in the business at that time was £1,181 15s. 4d. His son did not put in any capital. The Official Receiver: If you doubled the value of stock then you would have been £900 to the bad? Debtor: Yes, but I don't think I overvalued it. The Official Receiver: What do you now put your stock-in-trade and machinery at in your statement of affairs? Debtor: £6,300 is the estimate. The Official Receiver: Well, I am advised that your estimate of that could very well be divided by three. Continuing, debtor said he did not think that at the time he went into partnership the business was insolvent. The Official Receiver: Having regard to the fact that your balance in 1894 was only £1,181, and that that included an estimate of £11,000 to come from work in hand, and nearly £6,000 for stock, don't you think it was over-estimated? Debtor: No, I do not. Continuing, he said that at the time of the partnership being entered into he was possessed of other property, but every half-penny he had received had gone into the business. The overdraft on the bank now was £16,760, so that property to the extent of about £16,000 had gone into the bank since then. To enable him to do that he had borrowed £5,000 from Mr. Belcher and £2,750 from his sister-in-law. He had a big business, and never had too much capital. He first found the pressure somewhat severe in August or September last. He attributed the bulk of his loss to the Roedeian contract, which he entered into two years ago. His tender for that amounted to £47,335, that being about £1,100 lower than the next lowest tender. The Official Receiver said he understood from the architect that the deductions from the contract amounted to nearly £5,000. Debtor said there were no deductions to be made: on the contrary, there was a tremendous lot of additions. His son chiefly superintended that business, and he himself was there at every opportunity. Under the contract he was entirely in the hands of the architect, and nearly the whole of the material he sent to Roedeian was condemned by him. He had taken enough stuff there to do two such jobs, and, of course, that had caused a very big loss. Besides this, there was deviation or alteration in nearly every detail. When he was under pressure in August he had plenty of money, but could not get it in. Under the draft partnership agreement he was to draw £20 a month from the business, and although he had drawn more recently he should not think his drawings averaged more than £20 a month. He sold a brickyard at Warnham in August, and, after allowing for the mortgage, had about £800 left. That he put into the business. In August his accounts were taken, and showed him to be £11,000 to the good. The Official Receiver said on debtor's own showing his deficiency was now £8,800, though he (the Official Receiver) should put it at £10,000. Therefore,

since August last he had lost some £18,000. Did debtor not think the accountants must have over-estimated his assets? Debtor said he lost on the Roedeian job about £12,000. Mr. Belcher became guarantor at the bank for £5,000, and he gave him charges on all properties and contracts. After that Mr. Belcher lent him as much as £6,000 or £8,000. All his properties were charged in the first instance to the bank, then to Miss Seagrave, and then to Mr. Belcher, so that there was nothing to come from them. The Official Receiver: And the Brighton, Roedeian, and Newhaven works are all charged, and you don't expect anything to come from them. Looking at your position, don't you think that the balance-sheet got out in August was wrong? Debtor said it might have been a little too much in his favour. Asked as to why he had drawn £800 since August, debtor said he had private debts to pay. He had an expensive house and an invalid wife. The Registrar said the examination would be adjourned, and the Official Receiver would inquire into the matters. Thomas Samuel Peters was then examined. He said prior to going into partnership he had been managing jobs for his father. He had been in charge of the Roedeian job nearly all the time, and had scarcely had a day's holiday. He had been present on nearly every occasion when wages were paid, and had never known wages not called for by the men. There were on an average from 200 to 250 men at work there. He had nothing to do with the books. He did not think he had drawn more than £78 a year and expenses. The examination of both debtors was adjourned till April 20th.

**A BRISTOL ARBITRATION: AWARD.**—The award in the Dean-lane arbitration has been announced. The claimants were Messrs. J. R. and A. H. Bennett, and they asked from £12,000 to £13,000 as compensation from the Bristol Corporation, whose scheme of widening Dean-lane would interfere with Messrs. Bennett's colliery property, a slice of it being included in the scheme. The corporation said £5,000 was sufficient compensation. Mr. Robert Vigers, of London, sat as umpire for ten days—two in Bristol and eight in London—and his award is £8,186.

**WORKMEN'S COMPENSATION ACT APPEAL.**—On Saturday, in the Court of Appeal, Lords Justices A. L. Smith, Collins, and Romer sat to hear appeals under the Workmen's Compensation Act, 1897. McNicholas (appellant) and R. F. Dawson and Sons (respondents) was the appeal of Mrs. McNicholas, a widow, from the decision of the county-courthouse judge of Bradford, sitting as arbitrator, who decided that the appellant's husband had not met with his death under circumstances that entitled her to compensation under the Act. Mr. Mackaskie said he appeared for the widow on appeal from the judgment entered for the respondents, who were a firm of builders in whose employment the deceased man was on the day that the fatal accident occurred. The county-court judge had decided in the respondents' favour on the ground that he was not satisfied that the accident "arose out of, and in the course of, the employment" in which the workman was engaged by the firm. He was engaged to look after a steam-engine, and had to attend also to a mortar-tank, which the engine worked. This tank was outside, but adjoined the engine shed. On the morning in question he called out to his mate—a labourer—to know if the tank was ready for the engine to be put in motion, and the reply came back, "All right." A few minutes after the steam had been turned on the labourer found his fellow-workman's body being whirled round on the engine-shaft. Beside the door that gave access to the shed, there was a little door at the opposite end. To get to it a man would have to pass under the engine-shaft, which he could only do by crouching down. It was McNicholas's duty after he had set the machinery at work to go outside the shed and attend to the filling of the mortar-tank, and respondents' foreman in his evidence said that strict orders had been given the men never to use the little door when "steam was on." The man in charge of the engine had also to see that the engine-shed was ventilated properly, and this door was opened when the fire required more draught. Mr. Ruegg, Q.C., for the respondents, said the evidence left it absolutely uncertain whether the accident to McNicholas "arose in or out of the work" that he was employed by the firm to do. They had got a judgment, and it was for the appellant to show by evidence of some sort that the learned county-court judge was wrong in deciding there was not sufficient evidence to show what the unfortunate man was actually doing when he got entangled with the machinery. The learned counsel then argued that the work the man was engaged on was not work "on or about a building," and relied on the fact that the steam-engine was in a low shed that did not come within the definition of "a factory." At the conclusion of the argument, Lord Justice A. L. Smith said: Could there be a doubt that if anyone were asked to say on these facts whether or no the deceased man met with his death by an accident arising out of or in the course of his employment with the respondents the answer

would not be "Yes"? The respondents had attempted to get out of their liability by saying that this was not a "factory"—that the man might have been attempting to leave the shed by the little door for his own purposes. The county-court judge did not find the man had gone to the little door "for his own pleasure." The appeal would be allowed. Lords Justices Collins and Romer delivered judgments to a like effect. Mr. Parkins mentioned that the parties had arranged what the amount of the claim should be if the appeal was successful, and he asked for judgment with costs there and below. Mr. Ruegg asked that there might be a stay. The question was of the greatest importance to builders. Lord Justice A. L. Smith said they would not grant a stay, and that the appeal would be allowed, with costs on the terms asked.

**SCULPTORS' CLAIM FOR PREPARING PLANS.**—At the Exeter County-court on Monday, before his Honour Judge Woodfall, a claim for making plans was heard. Messrs. Harry Hems and Sons, sculptors, of Longbrook-street, Exeter, claimed £6 3s. from Rev. Dr. Newton, vicar of Barnstaple, for making two plans of proposed screens to be erected in Barnstaple parish church. Plaintiffs' solicitor explained that in August, 1896, Messrs. Hems received from the defendant a communication to the effect that it was intended to erect a screen to separate the chancel from the body of the church, and plaintiffs had the order for the plans, going to Barnstaple for the purpose. Mr. Harry Hems, in his evidence, said one screen was to be of carved oak of the 15th century pattern, typical of many screens now in use. The defendant said he mentioned nothing whatever about a rough sketch; he could have made that on the back of a prayer-book. His Honour said plaintiff had no case, as he knew from the outset Dr. Newton was not going to erect the screen himself. Judgment for defendant with costs.

**WORKMEN'S LIABILITY ACT.**—At the Brompton County-court, on Saturday, before his Honour Judge Stonor and a jury, Charles Thomas Baldock, a painter's labourer, sued Henry Smith and Son, builders and contractors, of Wetherby-terrace, Earl's Court, to recover damages for personal injuries received owing to the negligence of defendants' servants. Plaintiff was employed in varnishing the roof of St. Philip's Church, Kensington, when, owing to the collapse of the scaffolding, which was defective and insufficient, he was precipitated from a great height. His wrist was broken in three places, and he had since been unable to follow his employment. Defendants denied liability, claiming contributory negligence. A photograph of the broken bones, taken by the assistance of the X rays, was handed to his honour, who allowed it to be taken as evidence. The jury found for plaintiff for £125, and costs.

**UNLICENSED HOARDINGS.**—The Westminster Trust, Ltd., of Victoria-street, were summoned by the local vestry at Westminster Police-court on Friday for allowing a hoarding to be erected on the public way after the license had expired. Mr. G. R. Wheeler, the surveyor to the vestry, said the hoarding in question was situate at the corner of Great Chapel-street and Victoria-street, and was an exceedingly high one. Originally the height was about 60ft., and during one of the recent gales was blown down. The attention of the vestry was drawn to it, and witness was instructed not to renew the license. It was re-erected, however. The license for the hoarding expired on December 1 last. Mr. Alldridge, secretary to the Trust, said his impression was that the license had been renewed. A cheque was sent to cover the fees sometime in December, but during the last few days this had been returned. The company let the hoarding to an advertisement contractor, who paid all the fees. Mr. Marsham imposed a fine of £5, with 2s. costs.

**THE STRAND AND CLARE MARKET IMPROVEMENTS.**—Mr. H. T. Steward, F.S.I. (Messrs. Hunt and Steward, 45, Parliament-street, S.W.), the arbitrator appointed to decide the value of properties acquired by the London County Council under the Housing of the Working Classes Act, 1890, in connection with the Strand and Clare Market scheme, commenced his inquiry at the offices of the Strand District Board of Works, Tavistock-street, Covent Garden, on Monday. The first claim was in respect of the Hope Tavern, Blackmoor-street, which is held on lease for a term of which 20 years are unexpired at Lady Day next at £70 a year. Mr. Thomas J. Weaver, public-house valuer, Theobald's-road, W.C., expressed the opinion that £8,000 could be got as a premium for a 60 years' lease. Witness had applied the 4 per cent. table. He valued the rental of £70 a year at 20 years' purchase, and a shed at the rear £237. His total valuation, including the usual 10 per cent. for forced sale, was £6,567. These figures were supported by the evidence of other experts. On behalf of the London County Council, Mr. Thornton (Messrs. Thornton, Lumsden, and Newman, 15, Coleman-street, E.C.), and Mr. Weatherall, F.S.I. (Messrs. Weatherall and Green, 22, Chancery-lane)

had taken the rental of £70 a year on the 4 per cent. table, £952; value in possession, £100 per annum, £1,919; 4 per cent. table, 25 years' purchase, £2,500. Their total valuation was £3,362. In regard to the Grapes Tavern, Drury-lane, and the Artichoke, Clare-street, the arbitrator was asked to make an award of £3,647 and £7,200 respectively.

**THE PROFITS OF BRICKMAKING.**—Mr. Daniel Watney sat as arbitrator on Wednesday week, at the Surveyors' Institute, Savoy-street, W.C., to hear the claim, "Bachelor v. the Brompton, Chatham, Gillingham, and Rochester Water Company," for compensation in respect of land taken under their Act of 1898 by the company for the extension of their works. The claimant, Mr. R. J. Bachelor, of Chatham, who is a brickmaker and contractor, is the owner of the Darley Farm, the Chatham Farm, and several other properties in the district, nearly 20 acres of which the Water Company has acquired. Since 1892 he has, in the Darley field, been engaged in making bricks, and in 1896 purchased the Chatham field for the extension of his works. During the three years 1896-7-8, the average cost of the bricks had been 15s. 4½d. per 1,000, and the selling 30s. 10d. per 1,000, whilst the profits during the same period had been over £10,000. He claimed the sum of £78,95 for the value of the land taken and compensation for disturbance. It was estimated, on behalf of the complainant, that there was enough brick earth on the land to make 48,149,201 bricks, and it was contended that he was entitled to the profits, discounted for 12 years, which he could have made if he had been left in possession. The inquiry was adjourned.

#### CHIPS.

The new Levenshulme town-hall, in Stockport-road, Levenshulme, Manchester, was opened last Friday in the presence of the council and a large number of ratepayers, the architect being Mr. James Jepson and Co., of Stockport. The building was erected by Burgess and Galt, builders, Manchester, at a cost of £6,000.

The Meriden Board of Guardians have adopted plans by Mr. H. Chattaway, of Coventry, for a new sick-ward and board-room to be added to the workhouse buildings at an estimated cost of £1,400.

The application of the Goole Urban District Council to borrow \$6,500 for the purposes of public baths was inquired into at Goole on Wednesday week by Mr. H. H. Law, one of the inspectors of the Local Government Board. Mr. F. Chambers, surveyor to the council, explained the scheme, to which strenuous opposition was raised by some ratepayers.

The city council of Manchester have decided, on the recommendation of the Art Gallery Committee, to abandon the hitherto very successful autumn exhibition on the ground that the space available in the art gallery is insufficient, having been encroached upon by the increasing permanent collection of pictures.

Under the direction of Professor F. M. Simpson, of University College, Liverpool, acting at the request of the finance committee and in connection with the city surveyor, the alterations and redecoration of the town-hall of Liverpool are now approaching completion. For some months the large ballroom has been under repair, a new roof being erected. The whole suite of reception-rooms has been redecorated.

The annual meeting of the Banffshire Building Trades Federation was held in the institute, Keith, on Saturday, Mr. R. Cameron, the retiring president, presiding. Mr. Thomas Stewart, Keith, was appointed president for the year, and Mr. T. G. Fleming was re-elected secretary and treasurer. An executive council was appointed, and were instructed to consider whether arrangements could be made with architects for all works exceeding £500 in value being scheduled.

A large block of premises for Manchester warehousemen is approaching completion at the High-street end of Albert-street, Birmingham. The elevation is faced with red bricks with dressings of stone. There are five stories, the top one being in a mansard roof, and a basement floor in addition. The building has been erected from designs of Messrs. J. A. Chatwin and Son, architects, of Birmingham.

A Local Government Board inquiry was held at Burton-on-Trent, on Tuesday, the corporation having applied for power to borrow £32,500 for purposes of sewage disposal and electric light extensions.

Mr. A. H. Jennings, a member of the city surveyor's staff at Winchester, has been elected assistant surveyor under the Erith Urban District Council.

New offices are now being erected for the Barry Dock Co., and special consideration is being given to the ventilation, which will be carried out on the Boyle system.

## Our Office Table.

THE collections in the National Portrait Gallery are being rapidly augmented by gifts and purchases, and the walls of this new building promise soon to be thickly covered. The trustees have accepted as a gift a portrait of William Hone, the well-known satirist and author, painted by George Patten, A.R.A., and presented by Mr. Hone's daughter, Mrs. Joseph S. Soul. The trustees have also purchased eight works, viz.:—"Dr. Samuel Johnson," an unfinished sketch in oils, painted by James Barry, R.A.; this portrait, which was engraved in 1808 by Anker Smith, A.R.A., was for many years in the possession of the late Dr. George Tomlinson, Bishop of Gibraltar. "Charles, Second Earl Grey, K.G.," the "Reform" Prime Minister, painted by Sir Thomas Lawrence, P.R.A. "Col. Isaac Barré," the famous debater and orator in the days of William Pitt, painted by Gilbert Stuart; this portrait was given by Colonel Barré to his cousin, Colonel Phipps, from whose grandson it was obtained. "Robert Louis Stevenson," a pencil drawing, done at Sydney, N.S.W., on March 17, 1893, by Percy Spence; purchased from the artist. "John Manners, Marquis of Granby," the famous military commander, drawn in black chalk by Sir Joshua Reynolds, P.R.A., being apparently the original study for the well-known portraits in oil. "David Garrick," a pencil drawing, done from the life by John Keyes Sherwin, the engraver. "James L.," a small portrait on panel, as James VI. of Scotland; formerly in the Brühl-Finkenstein collection in Germany. "James Clerk Maxwell, F.R.S.," scientific discoverer and professor; a painting on china.

ABOUT two hundred of the best pictures at Hampton Court Palace are being removed from the places which they have occupied for many years to adorn the walls of Kensington Palace, which will be opened to the public in May. The pictures now being transferred to Kensington include the whole of West's collection, the best of which, including "The Death of General Wolfe on the Heights of Quebec," have been exhibited in Queen Anne's Drawing-Room, the central apartment of the suite of rooms on the eastern front, overlooking the gardens and the Home Park. While these pictures were being taken down it was found that underneath their outer covering of canvas and paper the walls were adorned with painting. The whole of the canvas was thereupon removed, disclosing the fact that the whole of three sides of the large room, which measures 41ft. by 34ft., was covered with paintings of more or less artistic value. These are in a very good state of preservation, except for the fact that they have been defaced by numberless small holes caused by the nails which had been driven into the walls upon which to hang the pictures. The ceiling of this room is, as will be remembered, occupied with a painting by Verrio, representing Queen Anne as Justice, with Neptune and Britannia holding a crown over her head, and various allegorical figures grouped around. The florid paintings on the walls now uncovered are by the same artist. Orders have been given for the holes in the walls to be carefully filled in, and when this has been done the services of artists of repute will be engaged to repair the damage, and, as far as possible, to restore the paintings to their original condition. This work will occupy many months, and while it is in progress the public will not be allowed access to the apartment. The newly-discovered paintings have been concealed in this manner for considerably more than a century.

In the Parliamentary Estimates in Class I. there is a net decrease on the net total for public works and buildings of £39,439 as compared with the total grants for 1898-99 in 1898, or of £14,439 after deducting the supplementary grant of £25,000 for diplomatic and Consular buildings. The decrease of £15,047 under the harbours estimate in respect of lighthouses abroad more than accounts for the reduction, as compared with the original estimates of this class for 1898-99. The estimate for art and science buildings contains an item of £1,000 for constructing a gallery and preparing accommodation for the Waddesdon bequest at the British Museum. The estimate for public buildings shows a net decrease of £5,000. The provision for Hertford House is less by £14,500, and that for the Record Office

by £16,000. On the other hand, provision is made for the first payment, £12,780, of the annuity for repayment of advances in respect of the purchase of sites for the new public offices under the Public Offices (Whitehall) Site Act, 1897. The gross total for surveys of the United Kingdom has risen by £5,615, but as the proceeds of the sale of maps and other credits are estimated to produce an additional sum of £4,750, the net increase stands at £865.

THE Parliamentary vote for the Houses of Parliament Buildings makes no provision for continuing in the next recess the work of mosaic decoration in the Central Hall; so, apparently, some time will yet elapse before Mr. Albert Moore's cartoons of St. Patrick and St. Andrew are reproduced in the two vacant panels. A sum of £1,000, however, is asked for to defray the cost of a hydraulic lift in the Speaker's house as a much-needed improvement; and £500 is proposed to be devoted to the reconstruction of the staircase from the newspaper-room to the basement. The vote for Public Buildings includes provision for the erection of a new wing at Dover House, and the construction of two passenger-lifts at the Royal Courts of Justice.

In the report of the London Chamber of Commerce Special Committee on Secret Commissions an amusing instance of mistaken ingenuity in "working the oracle" is given. A church was in course of restoration, and when the roof was nearly all covered in it was found by the architect that the copper nails specified for the slating had not been used by the contractors. He firmly told the builder that all the slates would have to come off again, and be properly fixed according to the specification. The same evening a dozen bottles of prime port were delivered at his residence, accompanied by a polite note from the builder asking his kind acceptance of the little present. The architect, ever as tender-hearted as he was honourable, was the last man to hurt anyone's feelings, even if he did not agree with them; so next morning he despatched his servant to the builder's house with a hamper of sherry, and a note that ran something as follows:—"Thanks for your kind present. Favour me, in return, by accepting the accompanying dozen of dry sherry. You will have to use the copper nails." And he had.

UNDER the provisions of the Liverpool City Charter Act, two pseudo-Classic edifices in that city, the churches of St. John and St. George, are being demolished. The former edifice, built between 1775 and 1784, is being dismantled and raised by Mr. H. Hindley, contractor, of Leigh, and the principals of the roof will be transported to Birkenhead, to do duty in a new music-hall at Birkenhead. St. George's Church, completed thirty years earlier, in 1734, and also having taken about nine years to build, is in the hands of other contractors, although the work of demolition has not proceeded so far. The spire of this church was built in 1818 at a cost of £10,000, and a suggestion is being vigorously urged that an arrangement should be come to between the trustees and the Corporation to allow it to remain, whilst the rest of the spare ground is utilised. On the other hand, a committee of ratepayers, formed at a recent meeting, have under consideration a letter written by the Bishop asking that the tower and spire should not be removed, and have suggested to the Finance Committee that the whole fabric should be removed, and that upon the site there may be erected a tramway station.

"ZINC: ITS HISTORY AND USES" was the subject of a lecture delivered by Mr. D. W. Kemp before the Edinburgh and East of Scotland District of the National Registration of Plumbers, held in Dowell's Rooms, Edinburgh, the other night, Mr. H. F. Kerr presiding. The ancient history of zinc, Mr. Kemp pointed out, was connected with its calamine ore, which, when smelted in a crucible with copper, made the alloy brass. The modern history of the metal was confined to the present century. The home of the industry was Belgium, where its manufacture had been carried to very great perfection. Although there was abundance of excellent ore in various parts of England, it was extraordinary that the manufacture of zinc should remain almost stationary in this country, in face of a constantly increasing demand. The mines of Cumberland had actually been leased to the Vieille Montagne Zinc Company, the largest zinc manufacturers in the world, who employed about 300 miners at Nenthead, Cumberland. After raising the ore, it was then railed in its raw state to Newcastle. From

that place it was shipped to Antwerp, and thence it was sent by rail or canal to the works in the interior of Belgium. The ore was there manufactured into spelter or sheet zinc, much of which came back to this country in various forms for plumbers and other consumers. The important question was thus raised as to what our technical colleges were doing. The metallurgy and uses of zinc were then explained by 90 limelight views. A number of slides with statistics were exhibited, which showed that the production of spelter in the world was, in 1881, 260,000 tons; in 1891, 356,000 tons; and in 1897, the latest returns, 436,000 tons, of which Great Britain produced in 1881, 24,000 tons; in 1891, 29,000 tons; in 1897, 23,000 tons; while the consumption of zinc in Great Britain in building construction, galvanising, box-lining, telegraphy and telephones, and other uses had grown enormously. As an evidence of the *esprit de corps* in the zinc works of Belgium, it was stated that, although it was an extensive industry, employing many thousands of workpeople—the largest, the Vieille Montagne Company, employing over 8,000 persons—strikes or trade disputes were unknown. This was due to the liberal management.

A PARLIAMENTARY paper issued by the Board of Agriculture, giving a report of their proceedings during the year 1898 under the Metropolitan Commons Act, 1866 to 1898, states that schemes with respect to Barnes Common and East Sheen Common were duly confirmed by Parliament. Both commons are now under the management and control of the Barnes Urban District Council. A scheme with respect to Harrow Weald Common, in the parish of Harrow Weald, Middlesex, has been approved and certified by the board, and now awaits Parliamentary confirmation. The common, which is 46 acres in extent, has been vested in the urban district councils of Harrow, Wealdstone, and Wembley, and the rural district council of Hendon, subject to the rights reserved to the surveyors of the highways and proprietors of land within the parish of Harrow and hamlet of Pinner of using it as and for public gravel, stone, and sand pits. The scheme for vesting the management of Petersham Common in the Richmond Corporation, on the petition of the latter, has been drawn up, and will be further considered on the expiration of the period prescribed for the delivery of objections or suggestions.

THE fiftieth annual report of the Prudential Assurance Co. is a record one. In the ordinary branch the new premiums amounted to £353,113, and the total premiums to £2,967,501, being an increase of £193,237. In the industrial branch the total premiums were £4,960,756, being an increase of £167,165. The total assets of the company are £33,599,708, being an increase of £3,161,371. The security guaranteed by such a stable reserve can hardly be over-estimated.

#### MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Society of Arts. "Cycle Construction and Design." Cantor Lecture No. 4, by Archibald Sharp, A.M.I.C.E. 8 p.m.  
Bristol Society of Architects. "Bills of Extras," by G. H. Oatley. 8 p.m.  
TUESDAY.—Institution of Civil Engineers. Discussions upon "Water-tube Boilers for Marine Engines," and "Recent Trials of the Machinery of Warships." 8 p.m.  
Perth Architectural Association. "Art," by William M. Page.  
WEDNESDAY.—Society of Arts. "Liquid Fuel," by Sir Marcus Samuel. 8 p.m.  
FRIDAY.—Architectural Association. "Reflections on the English Renaissance," by Reginald T. Blomfield. 7.30 p.m.  
Glasgow Architectural Craftsmen's Society. "Electric Lighting of Buildings," by W. G. Peddie; and "Leveling," by Geo. Davidson. 8 p.m.

#### THE ARCHITECTURAL ASSOCIATION.

MARCH 17th.—ORDINARY MEETING at No. 9, Conduit-street, W., 7.30 p.m. Mr. REGINALD T. BLOMFIELD on "REFLECTIONS ON THE ENGLISH RENAISSANCE."  
MARCH 18th.—VISIT to the ROYAL DUCHESS THEATRE, Balham-road, Three p.m. Trains leave Victoria (L.B. and S.C.R.) for Balham at 2.33 and 2.40.

E. HOWLEY SIM } Hon. Secs.  
G. B. CARVILL }

Mr. J. R. Davison, of Salt, near Stafford, has been elected surveyor to the rural district council of Woodbridge, Suffolk, from among 85 candidates.

Mr. George E. Clare, M.S.A., who has been practising at 66, Duke-street, Chelmsford, has taken into partnership Mr. Walter G. Ross, and opened a London office at 1, West-street, Finsbury-circus, E.C.

## THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXVI.—No. 2306.

FRIDAY, MARCH 17, 1899.

## THE NATURAL ENEMIES OF BUILDINGS.

OUR public and private buildings suffer very seriously from several causes which it should be the endeavour of the architect to lessen as much as possible. Our most costly architecture is reserved for the City, where the conditions are naturally the least favourable to the preservation of stone, or to the display of sculptural decoration. No one making any observation of buildings within a mile radius, say, of the Bank, could fail to notice the destructive agency of smoke and fog on several of the façades of stone, especially those in which there is much carving or detail. In some cases these façades are blackened surfaces in which all the finer details are choked up with a coating of thick soot, and their features almost entirely obliterated. From an architectural point of view, there is not much to regret; the blackened veil of smoke and dust have here and there done a service in throwing into obscurity and gloom a mass of intricate and petty detail, and in emphasising the main features and proportions. We often stop in amazement opposite a new building on which the carver has been allowed a free and unrestrained license—as in the new Carlton Hotel in the Haymarket, or some City office—and notice the execution of delicate and refined carved surfaces, which must, in the course of a few years at most, be completely lost to view. And we naturally pause and exclaim, What a waste of labour! Is it worth the expense? Would it not have been wiser to have expended all this art-craftsmanship in carving the walls of the hall, or even in making one handsome entrance, where the carver's skill would have been appreciated, or in decorating the interior walls of the saloon *salle à manger*, or state rooms with something better than ordinary commercial imitations? With the bitterest of ironies, that Nemesis of our London atmosphere speedily reduces all our efforts in this direction to a mere blank. The atmosphere is a destroyer and a leveller of the most ruthless kind, so that if an architect fails to use his common sense in the selection of the proper material, or in restraining his desire for elaborate ornament externally, he is the sufferer. On the choice of the right stone, numerous articles, essays, and papers have been published, though architects still go on building in our great smoky cities like Glasgow, Manchester, and London with soft limestones, or with the wrong variety of stone, regardless alike of its composition and of the proper position in a building of the particular bed of the stone. There are plenty of good weathering stones, as those of St. Aldhelm Box Ground, Corsham Down, Combe Down, of the Bath stone variety, if the proper selection is made and the stones are well set. There are some better suited for projections like cornices and weatherings, others for recessed faces. And we fear there is less attention given to the mode of setting, and the positions certain stones ought to occupy; the clerk of works is not always expert in the qualities and modes of working, and the architect, if he specifies a certain quarry and bed, and thinks he gets it, leaves the rest to the clerk or foreman. The other day, at the Architectural Section of the Philosophical Society of Glasgow, Mr. Oscar Paterson read a paper on "Atmospheric Influence on Architecture and Decorations," in which he pointed to the noxious condition of the atmosphere of that city, as the result

of the free escape of factory smoke and the oxidation of the sulphur in the coal into sulphuric acid. To this corrosive and virulent compound is due the erosion of the stone of the public buildings of Glasgow, as well as the destruction of vegetation. The "free molecules of carbon carried over in the soot of factory smoke settled on the stonework, and turned the natural brightness of the material into a gloomy and sombre grey, destroying at once the precision, fineness, and quality of the architecture." The sombre grey, or, rather, sooty veil of carbon which settles over our buildings in London, as well as in Glasgow, may, as we have just remarked, not be an altogether unmixed evil: the grey stone may, in some cases, mitigate the obtrusiveness of irritating or over-florid ornament, and tend to broaden the masses. But the evil is great in those buildings where the architecture is of a superior quality, and where this film of carbon completely destroys the precision and fineness of the mouldings. Can nothing be done to relieve our city architecture of this curse of smoke and fog? This is the question that confronts the modern reformer; but, from the opinion of scientific experts, like Professor Oliver Lodge, no charge of electricity is likely to prevent a London fog, and we are afraid it will be a long time before the idea of making gas at the great coal-fields, and of conveying it to London in huge pipes, is likely to be realised. But till it is forbidden to import crude coal into London, and the use of gas-stoves is made compulsory, we have no promise of amendment. Legislation only will effect a remedy. But if we cannot prevent the blackening of our buildings, we can do something to protect the stone from erosion and decay. Blackness not only disfigures our buildings, but the statuary of all our public squares. The coating of oxo-sulphides destroys all the features and modelling, and Mr. Paterson suggests a remedy based on experiments made at Berlin by the municipal authorities. We can bring to London and our smoky cities excellent stone that will resist acids, there are solutions manufactured (we have "Fluate," for example, for hardening and waterproofing the surface of our stonework), and we have other materials like terracotta and faience, by the employment of which discoloration can be avoided; though let us not again fall into the mistake of imagining that we can ever bring the brilliant skies of the South to this climate, or ever reproduce the architecture of Venice in our cities.

There is another deadly enemy to building—that of dampness. In spite of our building by-laws and other regulations, dampness prevails to an enormous extent. Quite fifty per cent. of our modern houses are situated on damp soils or undrained sites. We know of large estates in the south and western suburbs of London that have been built on marshy and waterlogged soils. People come and go, tenants are found to occupy the houses, though many habitations have never had a bed of concrete laid beneath them, and thousands more are flooded at every exceptional high tide or during heavy rainfalls. The by-laws of the London County Council under the Metropolis Management and Building Acts Amendment Act, 1878, have provided for layers of concrete 6in. thick over the sites of all buildings. Section 122 of the London Building Act prohibits the erection of any building upon land below the level of Trinity high-water mark, or on any land incapable of drainage into a sewer. These regulations have no doubt produced an improved condition of things as far as possible; but they are still powerless to prevent the entrance of damp in other ways. Walls are still allowed to be built which are in no sense impervious to moisture. What with porous bricks and mortar, imper-

fect dampcourses, unprotected underground rooms, and leaky roofs, moisture enters in many unsuspected ways. Happily, we possess means for preventing the transmission of moisture through walls or from foundations, if only those responsible for building would use them. It is curious that architects are still found who prefer battening to cavity walls, or cement facing to such an impermeable vertical course as that of the "Hygeian Rock" composition; but so it is. If the added strength given by a vertical layer of this material is more than sufficient to compensate for the loss of cross-bond, there ought to be no hesitation. The architect has to reckon on the destructive agency of moisture, not only in rendering our houses unhealthy, but in promoting incipient decay, dry-rot, and the destruction of internal decoration. Dampness also acts as injuriously to electric light and power installations by causing a leakage of the current. In all these different ways it becomes very necessary to introduce safeguards which will check the absorption of moisture. By horizontal dampcourses, such as those afforded by Callender's pure bitumen, or by vertical plates of similar substances, it is possible to cut off all external moisture from our buildings. Modern hygienic construction, as well as protection of our architecture and decoration, call for the adoption of every expedient to arrest the destructive action of both these enemies to our city buildings.

## MODEL SPECIFICATIONS.—LVI.

## ELECTRIC LIGHTING.

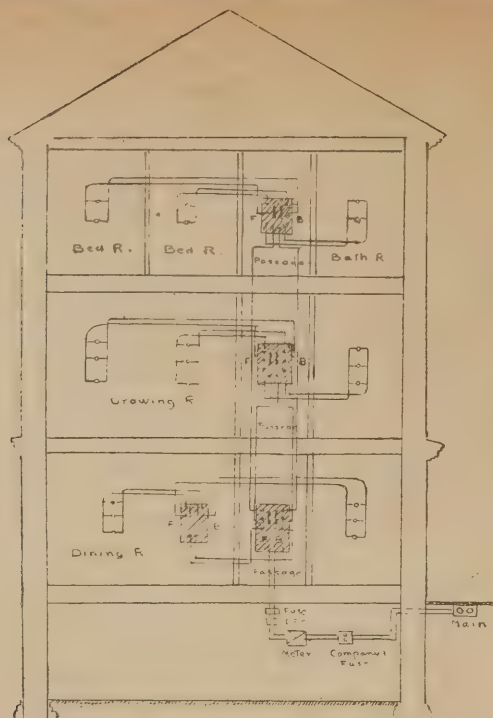

IT would be unnecessary to give the reader here any elementary knowledge of electric lighting, and we refer him to the numerous handbooks on this subject, and to the series of articles that have appeared in this journal. The regulations of insurance and electric supply companies are important. (See Mr. H. M. Leaf's book on "The Internal Wiring of Buildings.") We shall confine our remarks chiefly to the wiring of a building for incandescent lamps, and recommend that the architect should make himself familiar with the many terms and definitions of the units of force and work, such as "volt," "ohm," "ampère," "watts," &c., used to express respectively the electrical pressure, the measure of resistance of the conductor, the unit of quantity of current, rate of flow, also with the Rules for electric installation issued by the "Sun" and other fire offices. E.M.F. are initials that stand for electro-motive force, or the pressure of current along the wire, and this pressure as measured in volts. The "difference of potential," as it is called, is the difference of pressure between the ends of a circuit.

The best arrangement of circuits is to divide the current into a number of small circuits, as faults are then more easily found out. If the public supply is taken, the current is conveyed to a central distribution board, and from this small circuits are taken to the lamps. In a large building cables are run to other branch distribution boards (see diagram), where the circuits are again subdivided. This is the safer and more economical plan, and the clauses we give are on this system. The best places for safety fuses are the distribution boards where the small circuits branch off. All leads from mains should be fitted with them.

Instead of wood casings for the wiring, iron barrel is largely used, and has the advantage in installations in buildings where the wiring is put in in the early stage. The iron barrel can be fixed in the walls and floors, and the wires are then drawn through afterwards by cords. In this case special junction boxes are made instead of T-pieces at the angles.

The candle-power required per square of

100ft. of floor has been given as follows:—Halls and passages 20 to 30, dining-rooms 30 to 40, drawing-rooms 45 to 55, bedrooms 15 to 20c.p. This power is the first thing to be considered. It is necessary to be able to light a certain number of lamps in each room at one time, and these groups of lamps should be specified so that separate switches should be provided, and fuses for each group. Distinguish between the wires which feed the lamp called "light" wires, and those wires which are broken to take the switch called the "switch" wires. One is sometimes called the "positive," the other the "negative" wire. Each floor should have a "fuse" and switch-board, which should be of seasoned mahogany or teak polished, and let into wall to take the mains from the main switch in basement, and these should be insulated. Consult the regulations of the fire office and supply company, before deciding on the wiring. The meter and position of main fuse should be first determined (see sketch). It is necessary to determine the number of lamps and their candle-power. A 16c.p. lamp will light 60 to 100 square feet of floor. In large private buildings a pressure at the house of 100 or 110 volts is sufficient. The meter should be placed in a dry, fireproof building in the area where the company's meter and double pole fuses are set. The mains may be 19/14 in size, and pass on to a room or lobby where the distributing board is fixed. The latter should be of slate, and be mounted upon ebonite, so that there is no connection between portions having opposite polarities. On this distributing board there should be a D.P. switch and the branch fuses, and a switch on both the positive and negative branches. The secondary mains to each floor, 7/16 size, proceed from this board, which may be inclosed in glass. The secondary main is distributed from a fuse-board on each floor, and there is a switch below the board to cut the current off. From each fuse-board wires are taken to the lamps on each floor, a 7/18 cable. The highest insulation type of cable should be used, and one authority recommends white pine casings, shellac varnished inside, and thin sheet lead over the casing to protect the wire from any water. Ceiling-plates and switches of porcelain are preferred; also single-light pendants with a switch to each lamp. For basements, passages, and bedrooms 8c.p. lamps are sufficient—in fact, they are more economical in wear.

The rules and regulations of the Society

of Telegraph Engineers and Electricians for the prevention of fire risks should be studied before writing specification. These are a few:— "Conductors: All conductors must have a sectional area proportioned to the work, so that if double the current they are intended for is sent through them their temperature may not exceed 150° Fahr. All casings to be in sight and be accessible; all conductors to be insulated, and be kept well apart. It is a good plan to colour the positive 'lead' differently to the negative. Metal fastenings for conductors are to be avoided. Switches, &c.: These should be so constructed that when the handle is turned to and from the positions of 'on' and 'off' it is impossible for it to remain in any intermediate position, or to permit of heating. The handles should be completely insulated from the circuit. Switches, commutators, connections, lamps, and other fittings must be mounted on incombustible bases. Cut-outs mounted on wood bases should be rendered unflammable."

It is a good plan to provide a separate sum for lamps and fittings, stating they are to be supplied by any approved firm, such as Messrs. Strode and Co., Osnaburgh-street; Perry and Co., Grafton-street, W.; Rashleigh Phipps and Co., Oxford-street; or the lamps and fittings may form a separate contract. It is better for the proprietor or his architect to select the electroliers, pendants, and brackets.

The following outline specification is given in Sir David Salomon's work, "Electric Light Installations." Although not complete, it may serve as a groundwork:—

- "All work should be first class.
- "Building—i.e., engine-house and accumulator house should be substantially built, fireproof, well-lighted, dry, and with good ventilation.
- "Machinery foundations should be placed on virgin soil, and must be substantial.
- "Special precautions should be made against vibration.
- "In some cases the foundations must not be built up with the earth in contact, but a small air-space should intervene; a brick wall being built to keep the earth in position round the foundations.
- "Dynamoes, alternators, engines, and other apparatus to be supplied by well-known makers, and from firms of standing.
- "No machinery of apparatus to be inserted which is new and untried.
- "In the case of gas-engines particularly, select the maker who has had the longest experience.
- "The accumulator should be obtained from one of well-known firms.

- "Mains between the engine-house and dwelling-house, or the point where the light or power is to be supplied, should by preference be a concentric cable of the highest insulation, lead-covered on the outside, and drawn into a cast-iron pipe, with manholes at such points as may be found necessary; the whole of this underground system being made completely water-tight.
- "It may prove an advantage to lay in the same pipe a telephone wire for communication between the point of distribution and the engine-house.
- "Mains in the house, the small wiring, and the casing should be first-class in all respects.
- "No wiring in the house to be imbedded in the walls.
- "In those instances where the casing is let into the wall so that the cover may be level with the general surface the casing must be painted or protected in some way from any moisture that might reach the wood from the plaster or other material of the wall.
- "No wiring to be under floors or in any position that may be inaccessible.
- "Where casing is found to be impossible, composition metal tubes may be employed, but none of greater length than will easily permit of being threaded by passing through it first a stiff wire.
- "Where alternate current is employed, both leads must be drawn into the same metal tube.
- "The section of all cables and wires to be determined by a temperature test.
- "All cables and wiring to be stranded.
- "Any cable or wire passing through a partition or anything of a similar nature should be carried through an earthenware pipe by preference.
- "The distance between all conductors having opposite polarities should be at least lin.
- "Should it become necessary to place conductors under floors, the floor-boards must be screwed down over such places.
- "Switches, connectors, ceiling-plates, lamp-holders, and other fittings should be of the best construction, of non-combustible materials, and insulated from the walls and ceilings.
- "No fitting to be used as a return, and all circuits to be insulated metallic circuits.
- "Twin-wires to be well insulated, and no wall connectors to be placed without a switch.
- "Arc lamps and motors to be well protected.
- "In damp situations and in stabling, special precautions must be taken against damp and deleterious gases.
- "No sub-circuit should carry more than 6 to 10 amperes.
- "All joints to be thoroughly well made, and outside the house placed in joint-boxes filled with pitch.
- "In the house there should be a main switch-board, and upon it a D.P. switch, an ammeter, a voltmeter, and the fuses of the branches which lead to subsidiary fuse-boards on each floor.
- "Every fuse-board to have a D.P. switch to cut off the current from that floor.
- "All lamps in bedrooms to be capable of being pulled up to a suitable height, and down to the floor when fixed near toilet-tables.
- "Connectors to be placed by the bedside, and also where the inmates are accustomed to work.
- "All connectors, switches, and fuses to be placed within easy reach.
- "All switches to be placed at a convenient height on the shutting doorpost inside the room, the exception being the switches required for subsidiary or portable lamps.
- "Floor and table connections to be so arranged that when not in use a flap can shut down over them for their protection, and be level with the floor or table.
- "All apparatus, fuses, &c., should be labelled.
- "All disputes to be settled by arbitration.
- "Provide a schedule of prices for extras."

1. *Notice.*—Give all notices to Electric Supply Company, pay fees and charges for making connections to mains.

2. *Generally.*—The materials and workmanship to be of the best kind, and to conform to the regulations of the San Office and Supply Company. All fittings, whether switches, ceiling, wall-plates, &c., to have dry wooden blocks behind, shellac-varnished, or plates of ebonite. All screws used to be insulated from circuit.

3. *Distribution Board.*—The circuits to be grouped on a suitable distribution board of polished teak or polished mahogany. Or—

The main switch-board and distributing switch-boards, "cut out" or fuse-boards to be of enamelled slate, the positive and negative portions insulated. The slates to be mounted or framed in teak or mahogany, with glazed doors, and the screws to be insulated by ebonite rings. Each board to have a cut out and switch in the positive side, and a cut-out on the negative side. Or—

The main double-pole switch and fuse for 50 amperes to be fixed close to entrance of mains, and a pair of 19/16 to be run in area to two sub-

cause—of the weight of the flanges. What really puts a limit to the augmenting indefinitely the depth of a truss is that the corresponding augmentation in the length of the diagonals calls for greater net sectional areas—at least, so far as the members exposed to stresses of compression are concerned, and for a large amount of extra material to afford the requisite degree of stiffness to not only the ties and struts composing the web, but to give the proper amount of rigidity to the whole structure. Besides the limiting conditions there are others of a practical character which prohibit the use of very great depths altogether disproportionate to the span. It should be borne in mind that economy of the material itself, which is frequently the least expensive of all the various items comprised in an extensive and important engineering work, does not necessarily signify an equivalent economy in the construction of it in the workshop or in the erection of it on the ground. It may, therefore, be laid down as a general rule, applicable to every description of constructive work, that the limit of any particular theory lies in its application to practice.

It has been stated that an increase in the depth of a truss was attended by a diminution in the amount of the stresses upon the flanges—a statement that admits of a simple proof. Let  $w$  equal the total load uniformly distributed over a truss, and the rest of the notation as before. It is unnecessary to adduce or prove the general formula, giving the stress upon any part of the flanges of a girder. One particular case will suffice, and it is that which applies to the stress at the centre of the flanges which is obtained from the expression, putting  $S$  for the stress—

$$S = \frac{WL}{8D} \dots\dots\dots(2)$$

It is worth mentioning that this equation is universal, and applies alike under the same conditions of loading to the arched, suspension, bow-string, plate, and open-web types. From (2) it is seen that the amount of stress upon the flanges is in the inverse proportion of the depth, and, therefore, the greater the depth the less *ceteris paribus* the stress. The truth of the second assertion has now to be demonstrated—namely, that an increase in the depth has no effect theoretically upon the shearing stresses, or the stresses upon the diagonal members of the web.

Let the diagrams in Figs. 2 and 3 represent the elevation of half of two triangular trusses under exactly the same conditions of span and loading, in which the value of  $\theta$ —that is, of the angle which the diagonal members make with the horizontal—is the same in both examples. The depth of the truss in Fig. 3 is, however, greater than that in Fig. 2. Suppose a single weight or a summation of several weights situated between the centre  $K$  of the truss, and the point of application be placed upon any one of the triangular apices as shown in Fig. 2; it is required to trace its action and ascertain the stress it produces upon the diagonal bar  $ac$ . In the first place, the weight is supported by the vertical strut, and is transferred to the lower end of it at  $c$ . When it arrives, or is presumed to have arrived, at this point, it tends to deflect the truss there, and exerts a pull upon the inclined bar  $ac$  and the panel length of the truss  $bc$ , subjecting both of them to tensile stresses, which can be thus determined. Upon any convenient scale plot the line  $cd$ , and make it equal to the weight placed upon the apex. From the point  $d$  draw a line parallel to the panel length in the direction of  $de$ , which, in this instance, will be horizontal, and produce the inclined bar  $ac$  to meet it at  $e$ ; then if  $ce$  be measured on the same scale, the length of it will give the tensile stress upon the diagonal  $ac$ . It is also evident that the length of the line  $de$  will be equal to the stress upon the panel length  $bc$ , though we are not just at present concerned with the stresses upon either the upper or lower flanges, which will be subsequently investigated. Let the same weight be now placed upon an apex in Fig. 3, in which the truss has a greater depth. The action of the weight is exactly the same as in the previous instance, and a repetition of the graphical method of determining the tensile required will give the same result, and we shall have  $ce$  equal to  $ce$ . The same result might be arrived at analytically. Since the triangles  $cde$  and  $cae$ , are similar to the triangle  $abc$  in both Figs. 2 and 3, the same method of calculation may be employed as was adopted for obtaining the length of the diagonal  $AC$  in Fig. 1. Taking  $W$  to represent the weight, and making  $S_1$  equal to the stress upon the

diagonal bar  $ac$ , we have for both examples, using the same notation as before—

$$S_1 = W \times \operatorname{cosec} \theta \dots\dots\dots(3)$$

We may now pass on to a consideration of the number of triangles to be introduced in the truss, or, in other words, the length of the panels. Each separate panel is the length of that part of the truss situated between any two apices, and they are always equal to one another. Occasionally, but rarely, a shorter panel is located at the ends of the truss, but the practice is not one to be recommended. Once the depth has been fixed, the length of the panel is determined by the value given to  $\theta$ . If, on the other hand, the value of the angle  $\theta$  be fixed, the length of the panel becomes simply a function of the depth. American engineers adopt a wider range for the depth of their trusses than we do in England. Our limits for depth are from about one-twelfth to one-ninth of the span, whereas in the United States a very general practice is to employ a depth ranging from one-fifth to one-tenth of the span, and for long spans the proportion may be considered to average from one-seventh to one-eighth of the span. Under the first assumption, putting  $l_1$  for the length of panel, and using the same symbols, the equation is—

$$l_1 = D \times \cot \theta \dots\dots\dots(4)$$

and in the second—

$$l_1 = l \times \cos \theta \dots\dots\dots(5)$$

With respect to the length of panels, it is important to keep in view the nature of the stress—whether tensile or compressive—to which the up-rights of the net are subjected. If the vertical members undergo stresses of compression as in Figs. 2 and 3, the diagonals will be in tension, and longer panels may be used than in the example in Fig. 1, in which the conditions are reversed, the vertical bars being in tension, and the inclined ones in compression. The usual practice in designing horizontal trussed girders with parallel upper and lower flanges or booms is to make the length of the panel equal to the depth of the girder, a proportion which works out both for struts and ties, and in point of economy also, exceedingly satisfactorily. The value of  $l$  is then obtained from the simple expression—

$$l = \sqrt{l_1^2 + D^2}$$

As the example in Fig. 1, which has been selected for analysis, is a truss belonging to the through-bridge type with the load on the lower flange, the vertical members  $Ae$  and  $Be$  are superfluous or redundant, and are frequently omitted in actual practice in bridges of large span with long panels, as the saving in the weight of the booms is in those instances worthy of consideration. It is a great mistake, however, and one against which the young designer should carefully guard, to cut or fine down material too much simply because the dictates of pure theory may admit of it. True economy is quite distinct from parsimony in iron and steel as in money.

T. C.

#### TECHNICAL EDUCATION IN THE BUILDING TRADES.

A REPORT upon the present state of education and training in the building trades has been prepared by a special sub-committee, and has recently been adopted by the Technical Education Board of the London County Council. Evidence was given before the sub-committee, of which Mr. Richard Roberts was the chairman, by Dr. Walmsley, the principal of the Northampton Institute in Clerkenwell; Mr. Millis, of the Borough Polytechnic; Mr. Henry Holloway, of the firm of Holloway Bros., who spoke specially of the great decline in apprenticeship in the building trades during the last few years; Mr. Robert Mitchell, educational director of the Regent-street Polytechnic, who declared that the objection by the masters to apprentices far exceeded any obstacles placed by the men or the trade unions; the last witness's brother, Mr. Charles F. Mitchell, head of the technical and architectural schools at the same Polytechnic; Mr. Peer, secretary of the labour bureau at the same institute; Mr. H. Phillips Fletcher, A.R.I.B.A., director of the Trades Training School, Great Titchfield-street, W.; Mr. Howard Colls (Messrs. Colls and Sons); Mr. S. Barker, organiser of manual instruction under the London School Board; Mr. A. A. Ellis, Camberwell Green Science and Art Evening Classes; Mr. George Cole, secretary of the London dis-

trict of the National Association of Operative Plasterers; Mr. Sidney H. Wells, principal of Battersea Polytechnic; and many working foremen and practical plumbers and carpenters. The sub-committee make the following distinct recommendations:—

1. That every effort be made to lengthen, with Parliamentary sanction, the present term of school life, including a raising of the legal age for leaving school, and that between 13 and 15 opportunity should be afforded for special instruction in manual training and drawing.
2. That no restriction whatever should be placed upon the persons attending theoretical classes in technical subjects apart from the general requirements that the members of the class should be capable of profiting by the instruction afforded.
3. That, with a view to enabling artisans to become qualified as general foremen, mechanics belonging to any branch of the building trades be permitted to attend both the theoretical and practical classes in other branches of the building trades.
4. That learners under 19 years of age and improvers should be permitted to attend practical classes, provided that they show sufficient familiarity with the trade to render their efficient training possible without undue interference with the progress of the class.
5. That sub-committees should be appointed to visit and report upon the classes in each trade, and discharge the other duties indicated in the report.
6. That, in the teaching of the purely trade classes (evening) and in the examinations connected with them, more stress should be laid on methods which secure mechanical skill and quickness of workmanship, as well as on theoretical knowledge, and students should not be encouraged to expend an undue amount of time and labour upon elaborate models of no practical use.
7. That, as far as possible, the teachers should be actually engaged in the trade in which instruction is given by them. In order to secure this, special classes should be instituted to qualify competent mechanics to be teachers, and for this purpose the polytechnics should be used as centres of normal training.

The Technical Education Board is now considering the best means of giving executive effect to these proposals and recommendations.

#### ARCHITECTS' REGISTRATION IN PRACTICAL OPERATION.

THE biennial report of the Illinois State Board of Examiners of Architects has just been published, signed by Mr. Dankmar Adler, of Chicago, the president, and by Mr. Peter B. Wright, of the same city, secretary and treasurer. The work of the board has been to a certain extent experimental in character, as Illinois is "the first State in the Union that has recognised the professional standing of the architect by an enactment which acknowledges his responsibilities and duties to the people." The board was organised in September, 1897, at Chicago. Up to the end of November, 1897, 426 applications for licenses had been filed; 300 had been approved, the remainder being under consideration, and 132 licenses had been paid for. On the issue of a report to that effect, an extraordinary and somewhat unexpected demand for licenses from architects already in practice set in; the number of application forms originally printed was exhausted, and a fresh edition was printed. Many of these were not returned, but by February, 1898, 714 applications had been approved, 73 rejected, with the intimation that the applicants were at liberty to sit for examination. One person took action against the board for refusing to grant him a license, but this has not yet been brought to hearing. On March 1 last year, under the provisions of section 5 of the Architects' Licensing Act, the first complete roll of licensed architects was made up by the secretary and published. An examination committee had been appointed by the Board, and at the first examination, held in January last year, 19 candidates presented themselves. A comprehensive and indeed stiff syllabus, dealing with building materials, construction, and sanitation, was set before the 13 candidates who submitted to the three days' examination, and only one had to be rejected, Mr. Ira B. Worsfold, of Waukegan, Ill., having the distinction of passing at the head of the first examination, gaining 84 marks out of a possible 100. The second series of examinations was held in June last at the State University at Urbana, and at these about half the candidates passed, the qualifying proportion of marks having been raised from 50 to 70 in a possible 100. It was decided at future examinations to accept the diploma of graduation for a full four years' course in architecture or architectural engineering at the University as sufficient for a license; moreover, that the applicant must produce satisfactory evidence that he has acquired the ability to apply this knowledge to design and construction. Seven hundred and twenty-nine licenses were in

force on the 1st July, 1898, and all but 64 of these have been renewed, of whom some holders have removed from the State, one has died, and a few have retired. The results of the licensing system have been, the Board state, to show a general acceptance of, and acquiescence with, the requirements of the law, although many complaints have been raised against those who had not taken out licenses and others assuming to act as architects. A committee of the Chicago Architects' Business Association has been appointed to prosecute violators of the law, the Board having decided that it was out of their province to take action in that direction. Appended to the report are a circular of information as to the scope of the Act, and two forms of architects' licenses. The report is published at the secretary's office, 112, Chamber of Commerce, Chicago.

#### VICTORIA DIAMOND JUBILEE MEMORIAL, SINGAPORE.

[SELECTED DESIGN.]

WE publish this week a perspective view and two plans of the design for the theatre and assembly rooms at Singapore awarded the first premium in an open competition inaugurated by the Diamond Jubilee Permanent Memorial Committee, Singapore. The principal front of the building faces west, the central portion being occupied by the main hall and grand staircase, while the north wing contains the assembly rooms, and the south wing, which is entirely cut off by the party-wall, contains the theatre. The assembly rooms and theatre are shown combined in one block, in compliance with the conditions laid down for the competition, and, as will be seen from our illustrations, the building is symmetrical, consisting of a central square tower and four smaller square towers, two at each end, connected with the central tower by rectangular main blocks with sloping roofs. There are two floors in the main blocks, and three in the towers. The main entrance to the assembly rooms is below the central tower. On entering, we pass through an entrance-hall, 42ft. by 20ft., into a main hall, 42ft. by 41ft., in which is placed the grand staircase, 12ft. wide. Adjoining the latter is a passenger lift connected with each landing. From the main hall we enter a supper-room, 80ft. by 50ft., with service-room screened off by movable partitions; a smoking-room, a card-room, retiring-rooms for ladies and gentlemen, two kitchen lifts, and two offices for the staff are also provided. On the first floor is the ballroom, 113ft. by 50ft., with organ space, a card room, and retiring-rooms for visitors and performers of both sexes. On the second floor in the central tower is a domed octagonal smoking and card room 32ft. diameter. Behind the tower, on the roof, is a kitchen, scullery, servants' rooms, and bath-room, connected with the ground floor by two lifts and a service staircase. This theatre has been designed in consultation with Mr. Horace T. Bonner, A.R.I.B.A., known in connection with the Croydon Theatre. The entrance is at the south end, and the exits and staircases are so arranged that, in case of panic, the audience can leave the building in a few minutes. The auditorium contains on the ground floor seats for 125 in the stalls, 275 in the pit, and eight in the boxes; a crush-room, 50ft. by 24ft., at the south end, and refreshment and retiring rooms for ladies and gentlemen are also provided. The first floor of the auditorium contains seats for 134 in the dress-circle and 14 in the boxes. There are also separate refreshment-bars and retiring-rooms for ladies and gentlemen. On the second floor in the towers at the south end are an electrical storage-battery room and a general storeroom. The stage of the theatre measures 50ft. by 35ft., and is entirely cut off from the rest of the building on the north by a party-wall extending above the roof, on the south by another wall and by a fireproof curtain, and on the east and west by fireproof doors. The lower ground floor, under the dressing-rooms and verandahs, contains a manager's office, a room for band and supers, and a storeroom for scenery in use, easy access to which is obtained direct from the stage and from outside beneath the verandah. A room for painting scenery and for general storage is proposed to be placed in a separate building in the grounds. East of the stage on the ground-floor are the actresses' dressing-rooms, with lavatory and verandah; on the first-floor, the actors' dressing-rooms, lavatory, and verandah; and on the second-floor,

the supers' dressing-rooms, lavatory, and verandah. The general dimensions of the building give a total length, exclusive of carriage porches, of 345ft., with a width of 133ft. The ground-floor, floor to ceiling, is 20ft., the first-floor assembly-room is 35ft. high, and the theatre from floor to ceiling of dome is 50ft. The clock tower is 127ft. high. The soil is removed from the lavatories in buckets, according to the custom in Singapore, and the native attendants have access to the lavatories by means of spiral staircases in the turrets. The dynamos for electric lighting are placed in a separate building in the grounds, to avoid vibration in the main building. The lifts, which are intended to be electrically driven, are on Messrs. Waygood and Co.'s system. Singapore is infested with white ants, which destroy woodwork in a very short time. Special care has therefore been taken in the design to substitute steel and cast iron for wood wherever possible. The walls

of the building will be of red brick and grey granite. The dressings, cornices, mouldings, and sculpture will be of terracotta and Indian patent stone. The arches and verandah columns will be of local grey granite. The interior columns, also girders, joists, and roof-frames, will be of steel. The grand staircase will have marble treads and balustrades, and will be supported on steel joists cased in marble. The floors of the main entrance-hall and supper-room will be laid with marble and mosaic; the floors of verandahs, cloak-rooms, lavatories, &c., with Sills' patent Indian tiles, Raniganj tiles, and mosaic; the floors of ball-room and stage and the doors will be of Moulmein teak. The sloping roofs will be covered with tiles and slates, and the domed roofs with copper. The architect is Mr. Francis Sills, A.R.I.B.A., who is known in Calcutta and Bombay in connection with the erection of many of the largest buildings there, and the engineer is Mr. W. A. Francken, A.M.I.C.E., who is also known in connection with large engineering works in the North-West Provinces, India.

#### A UNIQUE VANE.

THE above illustration represents a rather unique vane, which has just been manufactured for the municipal buildings at Blackburn by the well-known firm of metal-workers, Messrs. Benham and Froud, Ltd., of Chandos-street, W.C. The vane represents, as will be seen, an ancient ship, and is made entirely of hammered copper, thickly gilt, from a design by Mr. Henning, of the firm of Messrs. Potts, Son, and Henning.

#### NOTES FROM EDINBURGH.

THE seventy-third annual exhibition of the Royal Scottish Academy contains nearly one hundred fewer pictures and drawings than that of the preceding year; the difference is occasioned by the larger size of many of the oil-pictures. Very slight alteration is made on the general arrangements of the interior of the galleries, which are all that could be desired. The only departure from previous arrangements is in the selection of the north or entrance octagon for accommodation of the water-colours and some of the architectural drawings, the remainder of the latter being in the small octagon. There are a few good water-colour sketches of architectural subjects and a few interiors, and one very fine one of the "Poet's Corner in Westminster Abbey," showing the graves of Lord Tennyson and R. Browning, by James Cafe. This is a fair-sized picture, allowing the architectural detail to be seen, and in the style of Roberts's well-known works. The light is well managed to bring the tombs into relief.

The architectural drawings in this entrance-room are all, or nearly all, of large dimensions, and nearly all in black and white; but the association of such subjects with the brighter water-colours is not satisfactory. It answered better when architectural perspectives were all water-colour sketches, and there never has been, and probably never will be, a better arrangement for the architectural section, or such a one as to secure for the Academy an exhibition anything like representative of the architecture of the day. The dominant feature of the exhibition is the number of larger and smaller country mansions. Public buildings are also numerous, but not, with one or two exceptions, of much importance.

565. "Perspective View of Scotsman Buildings to the North," by Messrs. Dunn and Findlay, is a very large drawing, showing the north frontage of the large block of building, which is to form the whole of the west side of the new North Bridge-street. It has also a considerable frontage in Market-street, where the height of the elevation, with its ten stories, rivals the altitude of the old town. Its façade, however, is vastly different, with a large infusion of Classical details. Messrs. Dunn and Findlay send also large drawings and geometric elevations of the frontage of the buildings to the street—i.e., both to N.B. street and Market-street, below, which faces the north. The buildings, as a whole, appear to follow the leading lines and divisions of the competition drawings selected by the corporation, and illustrated in the BUILDING NEWS for Oct. 16, 1896; but the variations are considerable, partly by way of reducing ornamental work, and partly by alterations in the style of the dormers and other gables. The colonnade—a conspicuous feature of the upper part of the north front—is retained; the higher and lower gables, flanked with small octagon turrets, remain. In the N.B.-street frontage the large central gable is improved by giving it more of the aspect of the large, many-windowed Flemish house gable, and the two lesser gables to the street are not so angular and stiff as the Queen Anne samples of the competition drawing. This queer treatment of the gable seems to be growing popular, and specially with its absurd, or at least unnecessary, finishing with a semicircular pediment. This is retained also in the Market-street lower building; but it cannot be considered any improvement on the natural termination of this important feature. The North Bridge-street elevation has apparently all the shop fronts of the plain ordinary description. The perspective view is from Prince's-street, and shows, as the competition drawing did, a portion of the bridge and the east end of the street opposite the Scotsman side. 666, "Baltimore, North-East View," and 676, "The Same House, as altered for the Proprietor," are two sketches in pencil, softly shaded, of a large mansion, built apparently to weather storms of wind and rain, and which has much of the old castle-keep, with machicolated parapets and small windows of the Scotch Baronial. The work is by W. Leiper, R.S.A.

560, "Dawyck House, Peeblesshire," by T. A. Campbell, is another and larger mansion—apparently a large addition to an older one. The main feature appears to be a central tower; but as it has no greater altitude than other portions of the design, it may not be so intended; the other portions are in the ordinary modern style

of domestic buildings, but are not very compactly arranged. The entrance to a square gravelled carriage-way is by a low parapet wall, decorated on one side with a curious turret, terminating in what is not unlike the pinnacle of a Gothic spire. 569, "Kincardine, Deeside, N.B., by Niven and Wigglesworth, is another example of the larger mansion house, in the Scotch Baronial style, but with less of the old and more of the modern house—good-sized windows, &c., as shown in the perspective. It is a good example of picturesque arrangement, and without any needless variety in the projections of the plan. 561, "Red House, Ayr," is a large perspective view of both the house and its flower gardens, by James A. Morris. A small plan indicates the arrangements outside and inside the building—a great help to the proper understanding of the design, which comprises large additions to a large original. The most prominent feature is the addition of a dining-room and billiard-room, connected with the old part by a long corridor and courts. The gables of these two rooms have very deep oriels carried up through the two floors, with parapet and flat roofs, which rather drown the gables. The dining-room appears to be at an inconvenient distance from both kitchen and drawing-room; but there is very liberal arrangement for service in the courts and corridor. 678, "A Border Mansion House," by Leadbetter and Fairley, is another large mansion of three floors, but more compact in its arrangements, without any attempt at variety of ground plan. It is designed in the more homely Scotch house style. There are several mansions and houses on a smaller scale. 461, "House at Wester Coates, Edinburgh," by T. R. Patterson, a pleasing design of two floors in the Italian style, with deep overhanging eaves; 463, "Design for Country House," by W. Beattie Brown, jun., in the cottage style. 675, "Summer Hill, Kirkcudbrightshire," by Leadbetter and Fairley, a design with half-timbered work in the gables. The main building shows a great expanse of roof with double attic floor. 677, "House at North Berwick," by G. W. Browne, A., is another house in the English Cottage style, in geometric elevation, with steep roof and attic. 570, "Houses at North Berwick, Colinton, and Gate Lodge at Brigland," by R. S. Lorimer, are small etchings also in English Cottage style. 454 is a similar collection of small etchings of "Lodge and Entrance-Gates, a Clubhouse for Burntisland Golf Club, and Fitzgerald Memorial Hall at Torphichen," by Leadbetter and Fairley. The clubhouse is a large edifice for such a club, with two floors, and the lodge at gateway is of cubical proportions, with the commonplace aspect much improved by a lofty projecting chimney-stack, and an upper floor corbelled out to meet the chimney, and turret forming circular corner to the upper part. 458, "Proposed House, Dalkeith," by W. H. Mason, is a plain building, with well-proportioned front, in the Scotch style. 473, "Competitive Design for the Glasgow Exhibition of 1891," shows the principal pavilion, a building of great length, with central dome. The view shows also a double transept, the intervening wall space tastefully designed with arched lights, &c.

The examples of street architecture and public buildings are numerous; but, with a few exceptions, present nothing of novelty or note in the architectural detail. 670, "Library and Museum, Campbelltown," J. J. Burnet, A., is a long building of two stories' height, with a corner site, which is treated as octagonal. The greater portion of the edifice has a considerable amount of decorative detail, and a conspicuous feature is a lantern at the angle. A portion of the design, probably the museum, is in a plainer style, and thus preserves better the proportion of the rest. 671, "Royal Bank Offices, Dundee," by G. W. Browne, A., is a water-colour elevation, very nicely coloured, and shows a building of four stories, the two intermediate floors being decorated with Ionic pilasters and circular arcading. The doorway is at one end, and the appearance of the ground floor is not improved by a recess, with door to some place of business, the name of the firm written in large letters on a lengthy lintel. The top story has low, broad mezzanine windows in the Renaissance style, with sculptured grotesques between the usual heavy cornice and deep balustraded parapet. Mr. Browne sends also, in 667, three bank offices of B.L. Company's Banks in Falkirk, Renfrew, and Melrose, that in Melrose having a Queen Anne gable and large

circular-headed window as its outstanding features. 679, "Proposed Town Hall for Bathgate," by J. E. Fairley, does not show the principal front. The design has a tower with pyramidal slated roof, too much concealed by its large domed windows. 462, "Institute at Motherwell for the Y.M.C.A.," by A. Cullen, is a large building with the usual details of the Queen Anne style in two stories. 465, "Design for Business Premises, Glasgow," by Edward C. H. Maidman, is a geometric elevation of a lofty piece of street architecture of five stories, in water-colour, with shops below and a range of arched windows on the second floor, two larger in the centre and narrow window at each side. 474, "Business Premises, West Calder," by J. G. Fairley, is also a design of five floors in water-colour. 476, "Design for Meffan Institute, Forfar," by Swanston and Legge, has its tower and elevation in Queen Anne style, with wide arched openings on ground floor. 460, "General Accident Assurance Offices, Perth," by J. P. K. Young, has a little more of architectural detail, in the Queen Anne style, with the usual large openings on ground floor, a building of three floors. 474, "Technical School at Dunfermline," by D. Barclay, is a large edifice, the principal architectural feature being the somewhat elaborate projecting doorway carried up through the two floors, and finished with turrets and small portion of the gable between them. 571, "Girls' Cottage Home, Drymen," by J. A. Campbell, is not a large edifice, but picturesquely treated in Cottage style. 669, "The Sir W. Fraser Homes," by A. B. Paul, is a much larger institution. The design shows an arrangement of two-storied buildings ranged around a central court. 668, "Bangorm Asylum," M'Arthy and Watson, is not a large institution, and has no specially decorative features in its composition. 564, "Sailors' Orphan Homes, Kilmalcolm," David Barclay, is a building of two floors, with a tower as its principal feature. The number of the preceding examples of public buildings indicates a revival of business in the building trade, as there has not been so many in recent years. Of church architecture there is only one exhibit—472, "St. Stephen's Church, Craigie, Perth," by G. P. K. Young. This is a large perspective of a church complete, with nave, aisles, clerestory, and transepts, and possibly a chancel, with tower and spire on north side of the west front. It is designed in the Early English style, without much of decorative detail. The transept visible has great projection, and from a double range of windows appears to accommodate a gallery. It seems to have narrow-passage aisles, and the tower and spire are well proportioned to the size of the building. 445 shows the interior of "New Chancel of St. Patrick's," Edw. J. G. Fairly. This is a vigorous etching, showing a Classical interior, with its heavy plaster decorations, very similar to the interior of banking offices. The church has flat plaster ceiling, and the chancel has semicircular openings and square chancel, with altar, reredos, &c. This church was originally a large galleried church of the Anglican Communion, and has been vastly improved by removal of its galleries. 459, "Interior of Wilson U.P. Church, Perth," by Q. B. Wilson, is not a church-like one, having a roof of very wide span carried partly on piers of wood or brick, and has too much of the storehouse or railway shed in its aspect. 490 is an excellent perspective of the "Interior of the Upper Hall of the Signet Library," by G. Kay Green. 566 shows in a beautifully coloured geometric elevation the apse of "Lesmahago Church," by A. N. Paterson. The church apparently is one of the old galleried churches of wide span. The apse is semicircular, or nearly so, judging from a small plan appended to the drawing, which is on a large scale, and shows all the architectural detail, which is Classical in style. The apse has a domical ceiling, decorated with panels to correspond. The walls are tinted green. The pulpit, which has a high floor to command the side galleries, stands on the north side of the apse opening, and at the other is an elaborate stand for what seems to be a large font in white marble. The Communion table is placed in the centre at the apse wall, or near it, the pulpit platform being four steps above the church floor. The pulpit has an octagonal rostrum carried on two pillars, with wrought-iron stair and railing, and has decorated panels, with symbolic carvings above the top rail, which is concave, to allow of their being properly spaced. The apse opening has elaborate Classical details,

probably in plaster pilasters, with the capitals decorated with cherub faces. The soffit of arch is carried on two of these capitals, cut short a little below the necking, which has not so good an appearance as the scroll truss usually employed. 662, "Pulpit of Church of the Good Shepherd," by R. S. Lorimer, is more quaint than pretty. An Anglican pulpit, with three steps into it, ungainly long panelled rostrum, with two plain supports in front, Later Gothic carvings, and linen-pattern panels at the pulpit back to imitate a Mediaeval carpenter's work.

#### CHIPS.

The town-hall at Stonehaven, N.B., is about to be improved internally from plans by Mr. George Gregory, architect, of that town.

Mr. W. W. E. Fletcher, an inspector of the Local Government Board, has held an inquiry at Leigh into the application of a Joint Hospital Board, comprising the Leigh, Atherton, Tyldesley, and Golborne District Councils, and the Leigh Rural District Council, for sanction to borrow a further sum of £8,500 for the purposes of the infectious diseases hospital belonging to the board of Astley. Mr. J. H. Stephen, the architect to the Joint Board, explained the proposals, which is to be a total outlay of £20,000.

The committee of management of the Aberdeen Art Gallery have accepted tenders for the installation of electric light in the gallery, and have also approved of a scheme by Mr. A. Marshall Mackenzie, A.R.S.A., for the general improvement of the gallery. The whole of the ground floor will be devoted to museums, and the upper floor to picture galleries.

The partnership heretofore subsisting between S. H. Horton and J. S. Price, of Eppingham House, Arundel-street, Strand, W.C., architects and surveyors, has been dissolved.

During the past few months the St. James's Schools, Slaithwaite, have been enlarged at a cost of about £1,500, and they were reopened on Saturday afternoon. The architect was Mr. Joseph Berry, of Huddersfield. The schools, which were built fifty-eight years ago, have been modernised and rearranged on the central hall system. Besides the erection of the parish room, two additional classrooms, a cloak-room, lavatory, and a covered playground have been provided. The open playgrounds have been macadamised, the heating apparatus overhauled, more light has been introduced, and the ventilation improved.

St. Cuthbert's Catholic College, which stands on a bleak eminence overlooking Beaupre, or Bear Park, Durham, was founded by Dr. Gibson, the Catholic bishop, in 1804, for refugees escaping from France during the Revolution. The committee, to commemorate the jubilee of the restoration, are having a new clock fixed in the tower, which shows the time upon two illuminated dials and chimes the quarters, the necessary work being executed by Messrs. Wm. Potts and Sons, clock manufacturers, of Guildford-street, Leeds. Messrs. Wm. Potts and Sons are also making a new illuminated turret striking clock for Carlisle Town Hall, for the mayor and corporation; and making four new illuminated dials, 7ft. each in diameter, for the town-hall, Darlington, Co. Durham, for the mayor and corporation of Darlington.

The extensions to the Ingham Infirmary, South Shields, are being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke-flues, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Board of Trade have recently confirmed an order authorising the construction of a light railway in the county of Lincoln, from Grimsby to Saltfleetby, with a branch to Cleethorpes.

The ancient Independent Chapel in Fetter-lane is to be pulled down to make way for the extension of the premises occupied by a printing firm. Elton Chapel was established so long ago as 1660. The existing building dates from the year 1732.

The urban district council of Buckley, Flintshire, have adopted plans purchased by Mr. Eayrs, C.E., of Birmingham, for the drainage of the district at an estimated cost of £12,500.

A generator for the electricity works of the Plymouth Corporation is being built at Prince's Rock in that town, from designs by Mr. J. H. Rider, and under the supervision of the borough surveyor, Mr. J. Paton. Messrs. Pethick Bros., whose works adjoin the site, are the contractors, and the outlay is estimated at about £17,000. The buildings comprise boiler-house, 100ft. by 54ft., engine-house, 100ft. by 40ft., workshops, mess-rooms, and other accommodation for the staff and men, and a chimney 180ft. in height. A refuse destructor is to be built on part of the site.

## OBITUARY.

SIR DOUGLAS GALTON, K.C.B., F.R.S., the well-known writer on railway and sanitary questions, died on Friday last at his town residence, 12, Chester-street, S.W., in his 77th year. Born at Hadzor House, Worcestershire, he was trained at the Royal Military Academy, Woolwich, and received a commission in the Royal Engineers in 1840. In 1847 he became secretary to the Railway Commission that investigated the application of iron to railway structures, and many of the experiments necessitated by the inquiry were carried out under his supervision. Shortly afterwards he was appointed an inspector of railways, and became secretary of the Railway Department of the Board of Trade, a position he gave up in 1860. He served on the Royal Commission on Railways in 1866, showing himself a strong opponent of State purchase. A dozen years later he took part in an important series of experiments with automatic brakes. These experiments were designed to discover the coefficient of friction between surfaces moving at a high velocity, and they yielded valuable results as to the effect of brakes in bringing a train to a standstill. More than forty years ago he objected, but ineffectually, to the scheme proposed by the Metropolitan Board of Works for the disposal of London sewage at Barking, arguing that it ought to be taken at least down to Sea Reach. Captain Galton formed one of the Commission which, after the Crimean War, visited the barracks and military hospitals of Great Britain and Ireland, and subsequently those of our stations on the Mediterranean, and the general health of the Army was greatly improved as the result of the sanitary measures instituted by him and his fellow commissioners. The Herbert Hospital at Woolwich was also constructed from his designs. Later on he was a prominent member of the Sanitary Institute. He invented an improved stove, which bore his name, and several heating and ventilating appliances. He also rendered important services to the cause of submarine telegraphy. So far back as 1859 he served as chairman of the submarine cable commission. A few years later he was a member of the consultative committee, of which Lord Kelvin is now the only survivor, which was asked to advise the Atlantic company on the electrical and mechanical questions involved in the proposed cable of 1865. In 1860 Sir Douglas Galton became Assistant Inspector-General of Fortifications, and two years later Assistant Under-Secretary for War, a post he held until 1870, and from the latter year till 1875 he was Director of Public Works and Buildings in the office of Her Majesty's Board of Works. For twenty-five years he acted as general secretary of the British Association—an office which he resigned in 1895, when he became president of that body at its Ipswich meeting.

The death is announced of Mr. HENRY GODDARD, architect, of John o' Gaunt's House, Lincoln, at the ripe age of 85. He was a native of Leicester; in 1838 he went to Lincoln, and entered into partnership with Mr. Nicholson, an architect and surveyor. He was architect to the Great Northern Railway Stations between Doncaster and London, including the station at Doncaster, but not the one at King's Cross. In that capacity he was associated with the father of the present Lord Brassey as contractor, and he was also intimately connected with the great railway king, Hudson. He was surveyor to Trinity College, Cambridge, county surveyor to the ports of Lindsey, and diocesan surveyor and architect to the County Asylum at Bracebridge, near Lincoln. Mr. Goddard was on the Commission of the Peace for the city, a freeman of Leicester, and it is believed he was the oldest Freemason in the county of Lincoln. On December 4, 1838, he married Eleanor Ann, daughter of the late George Baker, of Nottingham, and the venerable couple celebrated their diamond wedding last December. In death they were not divided, for Mrs. Goddard, who was the junior by three years, only survived her husband four days.

St. Mark's new infant school, Holland-street, Manchester, designed by Messrs. Potts, Son, and Henning, architects, and erected by Messrs. Bullivant, was opened last week. It consists of a central hall, with classrooms on either side, teachers' room, ample cloakrooms, with lavatories, &c. The playground is asphalted, and is provided with a covered shed for assembling purposes. The school will accommodate 312 scholars. The cost has been £2,400.

## Building Intelligence.

BEDDINGTON CORNER, MITCHAM.—On Saturday, Lord Middleton opened the new isolation hospital at Beddington Corner of the Croydon Rural District Council. The buildings comprise an entrance-lodge; administrative block, with accommodation for doctor, matron, nine nurses, and eight servants; scarlet-fever pavilion, ten beds; diphtheria pavilion, ten beds; isolation block, with four wards of two beds each; discharging block, mortuary, and stables, laundry, and disinfecting block. The disinfecting block, which is to serve as a disinfecting station for the whole district, is fitted with a Washington-Lyons disinfecter. The floors of the wards, &c., are laid in Ebner's terrazzo paving, laid in situ. All the buildings are of stock bricks, and are covered with Broseley roofing tiles. The buildings have been erected under a contract with Messrs. D. Stewart and Sons, of Wallington, at a cost of £15,898. The furnishing has been carried out by Mr. H. W. Pearce, of Croydon. The architects are Messrs. R. M. Chart and Son, of Union Bank Chambers, Croydon.

PETERBOROUGH.—The foundation-stones were laid last week of a new Liberal club in Borough-bury. It is built on an L-shaped site. There is a tower at the Westgate end, surmounting the entrance. On entering the door of the club there is a hall, out of which a broad stone staircase leads up to the club-rooms. A smoking-room, 20ft. by 15ft., with bar, is approached from the staircase half-way up, and a little higher on the staircase there are a reception-room, a committee-room, a reading-room, divided by partitions so as to be easily converted into one hall 53ft. by 22ft. There is also a billiard-room for two full-sized tables, and another committee-room is provided on the second floor. At the north side of the building is a caretaker's residence, consisting of kitchen, living-room, and offices, two bedrooms, and a drying-ground over them. Outside, the building will be of red brick with buff terracotta dressings. Mr. Alan W. Ruddle, of Borough-bury, is the architect, and Mr. C. L. D. Gray, the builder.

YEovil.—The new premises for the Capital and Counties Bank at Yeovil, are being erected at the corner of High-street and Princes-street, and facing directly down Hendford-street. The architect is Mr. J. Nicholson-Johnston, A.R.I.B.A., of Yeovil. The style chosen is freely-treated Renaissance, and the material used for the exterior is Ham stone. The edifice has two stories above the actual banking premises, and above them again, recessed behind a balustraded parapet, is an upper floor, lit by dormers. The main entrance is on the angle of the two sides, and is built on the sweep, and there are oriel windows over this doorway on the first and second floor. The skyline is broken by gables of Flemish inspiration. All the stone carving upon the two fronts has been executed by Messrs. Harry Hems and Sons, of Exeter. Messrs. E. R. Bartlett and Sons, of Yeovil, are the general contractors, and Mr. Loxton is their foreman of works.

At the annual meeting of the Royal Birmingham Society of Artists, held on Saturday, Professor Sir W. B. Richmond, K.C.B., D.C.L., R.A., was elected President of the society in succession to Sir E. J. Poynter, P.R.A., whose term of office had expired. All the other officers and the professors were re-elected.

At the instance of the London County Council, Horace A. Curtis was summoned to Southwark Police-court on Friday for not properly securing tideboards at his wharf, Bankside. The prosecuting counsel said these tideboards were to prevent streets adjacent to the river being flooded. On two dates mentioned, consequent on the absence of these boards, the neighbouring streets were flooded. The defendant was ordered to pay a fine of £20 and 2s. costs.

The commissioners of Troon, N.B., considered on Monday a joint plan for the proposed sea-wall, submitted by Messrs. Eaglesham, Ayr, engineers for the burgh, and Mr. Mactaggart Cowan, the Duke of Portland's engineer. They estimated the cost of the scheme, which included contingencies and ten thousand cubic yards of banking in the northern-most part, at £8,915. The whole of the commissioners were appointed a committee to consider the plan, and afterwards consult with Mr. Turner, the Duke's factor. His Grace is to defray half the cost of the undertaking.

## Engineering Notes.

GREAT CENTRAL RAILWAY EXTENSION.—The new portion of the Great Central Railway's Extension to London, opened on Thursday in last week by Mr. Ritchie, and brought into practical working on Wednesday, extends from Annesley Junction, a few miles north of Nottingham, to Quainton-road, Bucks, a distance of 91 miles, after which running powers are exercised over the Finchley-road, whence two miles of fresh line run direct into Marylebone terminus. The engineers who have been responsible for the carrying out of the extension are Mr. Edward Parry, M.I.C.E., for the northern section, from Annesley to Rugby, a distance of 52 miles; and Sir Douglas Fox and Mr. Francis Fox, M.I.C.E., for the southern and Metropolitan sections—the southern section extending from Rugby to Quainton-road, a distance of 39 miles, and the Metropolitan section from Finchley-road to the London terminus. The contractors for the various sections were Messrs. Logan and Hemingway, Mr. Henry Lovatt, Messrs. Topham, Jones, and Railton, Messrs. Thomas Oliver and Son, Messrs. Walter Scott and Co., Mr. J. T. Firbank, M.P., and Messrs. John Parnell and Son.

## PROFESSIONAL AND TRADE SOCIETIES.

ARCHITECTURAL ASSOCIATION OF IRELAND.—On Tuesday week last the above association held their ordinary meeting at the Grosvenor Hotel, Mr. J. Holloway, vice-president, in the chair. A paper upon the structure and design of Egyptian temples was read by Mr. M. Glover, and was illustrated by numerous photographic lantern slides. The lecturer, after dealing with Egyptian legends of prehistoric times, traced the rise and fall of the various cults or worship, and then compared the ancient monuments of other lands with those of Egypt, giving as examples Stonehenge, in Wiltshire, and Ake, in Central America. After describing the tombs of the Egyptians from earliest times to the reign of Cheops, the builder of the Great Pyramid, Mr. Glover showed many illustrations of the domestic life of the people, taken from the incised mural decorations of the temples. A vote of thanks, proposed by Mr. G. Sheridan, and seconded by Mr. R. Butler, was heartily accorded to Mr. Glover at the termination of the address.

THE AUCTIONEERS' INSTITUTE.—The spring meeting of the Auctioneers' Institute of the United Kingdom was held at Derby on Friday. The morning was devoted to inspecting various objects of local interest, and afterwards the members assembled in the Guildhall, under the presidency of Alderman Edward Dobson, of Bradford. The report of the finance committee showed a balance in hand of £642. On the recommendation of the management committee, it was decided to form a Lancashire branch of the institute, with Manchester for its centre. The central committee also recommended that the Western Counties Auctioneers' Association be incorporated in the institute and form a local branch. This recommendation, which will make an increase of 60 in the membership, was unanimously adopted, thus bringing up the total membership to 1,141. The report as to the benevolent fund was received and regarded as satisfactory, £500 being in hand. Several questions relating to commissions were referred to a committee.

EDINBURGH ARCHITECTURAL SOCIETY.—At meeting of this association, held on the 8th inst. in the Royal Institution, Mr. Harold Tarbolton read a paper on "Plaster Work of the Renaissance period in Great Britain, and its Subsequent Phases." Mr. Tarbolton traced the history of plaster decoration from the somewhat isolated attempts of Italian craftsmen to pursue their art in England, and, on the death of their patron Henry VIII., the influx of Germans and Dutch with their strange and sometimes crude displays of decoration; and subsequently the introduction by Inigo Jones of the later and much-modified Italian modes. The starting-point of all plaster work was the moulding of old ceilings, which might be divided into two kinds—those with enrichments modelled in a cast from an impressionable medium such as clay, and those modelled *in situ*. Having described the two processes, Mr. Tarbolton remarked that no beautiful detail and delicacy of execution in plaster work, as in every

other craft, could condone any offence against proportion. Let them take all that was best in conception from the old work; they had magnificent examples within reach. He wished especially to emphasise the importance to architects of a personal and practical knowledge of the crafts. They could not fully understand the capabilities and imitations of any material until they knew its nature and ways of working. Until they had handled clay and worked with hawk and tool in hand and modelled *in situ*, it was next to impossible to appreciate the subtleties of the craft in plaster work. Architects should at least know thoroughly the interpretation and manipulation of one or more crafts in their endeavour to catch the spirit and vigour of the Earlier Renaissance workmen. A great work was being done in the School of Applied Art in Edinburgh in familiarising students with materials and their workings, and he was confident they would see the result in the work of the next few years.—On Saturday afternoon the members of the association visited Colinton Castle and Redhall, by permission of Colonel J. M. Trotter and Mr. D. Chalmers. On arriving at Colinton the party were met by Dr. G. W. Balfour and Dr. Rowand Anderson, the latter of whom acted as leader at both places. On the way to Colinton Castle the Episcopal Church, erected from the designs of Dr. Anderson, and recently decorated, was examined.

**SOCIETY OF ABERDEEN ARCHITECTS.**—At the second annual general meeting of this society, the office-bearers and council for the ensuing year were elected as follows:—viz.: Mr. James Souttar, president; Mr. Arthur Clyne, vice-president; Mr. John Rust and Mr. A. H. L. McKinnon, joint hon. secretaries and treasurers; committee—Messrs. William Kelly, A. Marshall Mackenzie, George Marr, George Watt, and Robert G. Wilson.

**SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.**—At the monthly meeting of this society held on Tuesday night, Mr. J. Smith, vice-president, in the chair, Mr. E. Prioleau Warren, of Westminster, gave a lecture on "Theory, Practice, and Tradition." He said the value of theories in the training of students of architecture is twofold. Theories provide an excellent mental exercise and incitement to study; and such of them as are of approved authenticity, logical quality, and obvious derivation from experience pass into tradition, become axiomatic, and form part of the necessary groundwork of all architectural training. They are practically statements of first principles, and should form the initial exercises of the student. The appliance of first principles must, to be really useful, become instinctive, almost unconscious, and is never more valuable than in the critical consideration of architecture, old or new. A sound theory, soundly remembered and applied, is an admirable corrective of appreciation or depreciation too thoughtlessly bestowed. Few things, after the prime necessities of trained imagination and constructive instinct, can be of more importance to an architect than the discriminating, the critical faculty, and it could never have been of greater importance than to-day. We have inherited the legacy of nigh upon a century of architectural unrest, we are beset by such a profusion of conflicting literature, we have reached such a chaos of conflicting styles, tastes, ideas, and examples, that the course of the student is a maze of confusion. It is often said that the profession of an architect is a modern one; it appears to be understood that he has evolved himself, has created his profession and its modern condition, as they stand. That is an impossible view. The evolution was gradual, and very clearly traceable from the Mediaeval master builder upwards. The Renaissance brought new and foreign ideas and forms, and with them the need of a trained interpreter, a man of education. The architect has to supply the imaginative element that makes building architecture; he is rendered necessary by the inability of the working builder to originate and organise comprehensive schemes. The difficulties of producing real architecture under modern conditions are great and complex. Commercialism is against us; the rush and hurry of the age are against us; and perhaps our worst obstruction is the almost absolute lack of real sympathy with architectural ideals, the extreme paucity of educated taste which we meet with in our patrons, and our public traditions are broken, and have to be revived, or created afresh. The enormous help and value of strong tradition, the

immense benefit of a real vernacular expression in architecture, are abundantly apparent to those of us who carefully study the past, who read between the lines of architectural history, and who are struggling to apply true principles under exasperatingly antagonistic conditions. There is, however, hope for the future: we seem to have done with revivals, with mere copying of a dead past. Our danger in that respect lies in a too violent tendency in the opposite direction—the exaggerated swing of the pendulum, the eccentricities of architectural revolt. We do now, at any rate, upon the whole, build, in a technical sense, well; better, indeed, than the last four centuries built in England. We have to see to it, that, building soundly, we also build beautifully. On the motion of Mr. C. Hadfield, seconded by Mr. E. M. Gibbs, and supported by Mr. Mitchell-Withers and the chairman, a vote of thanks was accorded to the lecturer.

**YORK ARCHITECTURAL SOCIETY.**—Twenty-three members of this society paid a visit to Sheffield on Saturday, and were received at the Midland Station by Messrs. C. Hadfield (past-president), J. B. Mitchell-Withers, Thomas Winder (members of council), W. C. Fenton (hon. secretary), and C. F. Innocent, representing the Sheffield Society of Architects and Surveyors. The visitors included Messrs. George Benson (president of the York Architectural Society), W. G. Penty and A. Pollard (past-presidents), and A. B. Burleigh (hon. secretary). The party were conducted to the Town-hall, after paying a passing visit to the Corn Exchange, and viewing the High-street improvements. All the principal features of interest in the Town-hall were examined, and gratification was expressed on inspecting the magnificent staircase, council-chamber, and reception-rooms. Under the guidance of Mr. Charles Hadfield, the Royal Hospital was then visited (the extensive buildings being from his design), and its general arrangements were described by him. The visit concluded with dinner, to which the visitors were entertained by the Sheffield Architectural Society at the Thatched House Hotel.

#### ROYAL ACADEMY ARCHITECTURAL DRAWINGS, 1899.

**T**HE days for sending in drawings and paintings this year have been fixed for March 24 and 25, the last day being Monday, the 27th. Sculpture will be received on the 28th.

Our friends and contributors who are willing to allow us to reproduce their drawings before they are sent to Burlington House, so that their works may be included in our series of illustrations from the Royal Academy Exhibition, to be published after the opening day, are invited to let us have them as soon as convenient for this purpose. We will return the drawings quickly, or, if desired, we are willing to forward them to the Academy direct, provided the necessary labels and letters to the Secretary are attached; and we will do this free of charge.

#### CHIPS.

An organ built by the Hope-Jones Electric Organ Company was opened on Saturday in St. Cuthbert's parish church, Edinburgh.

Sir W. C. Brooks has defrayed the cost of restoring the tower of the ancient parish church of St. Martin, Ashton-on-Mersey. The total cost of the restoration, which has been carried out from the designs of Mr. George Truefitt, London, is about £800.

The Local Government Board has just made an award in an arbitration case between the Hauts County Council and Bournemouth Corporation, by which nearly £10,000 was in dispute. Bournemouth claimed this sum from the county authorities for maintenance of main roads for three years, but the latter only offered £6,300, contending that charges for scavenging and watering main roads in the borough should not be borne by the county council. The award allows a sum of £6,500, practically supporting the contention of the county authorities.

Mr. James B. Hinks, who has, after thirteen years' service, resigned his position as assistant architect in the surveyor's department of the Liverpool Corporation, has during that period been engaged upon many public works, including the front of St. John's Market in Elliot-street, the new fish market in Great Charlotte-street, the building at the corner of Church-street and Parker-street, the Hatton-garden fire station, and the free libraries in Kensington and Everton.

#### COMPETITIONS.

**BRADFORD.**—The Markets and Fairs Committee of the Bradford Corporation have recommended that the architects in the city be invited to send in competitive designs for the proposed extension of Rawson-place Market, prizes being offered of £100 for the best, £50 for the second best, design submitted, the first prize, in case the corporation engage the successful competitor to carry out the works, to merge in the architect's commission, which is to be at the rate of 5 per cent., 1½ per cent. to be paid for preparing quantities.—At Tuesday's meeting of the town council the Watch Committee reported the following award in the recent competition for the new fire-brigade station:—Messrs. Mawson and Hudson, Bradford, first; Mr. W. J. Morley, Bradford, second; Mr. Owen Roberts, Liverpool, third. Mr. J. S. Toothill said there was a good deal of dissatisfaction regarding the adoption of the plans. He had protested against the site itself, and did so again. Ald. Sheldon said that there was a good deal of dissatisfaction among local architects, and asked the chairman to make some explanation. Mr. T. Crosland understood that the dissatisfaction was not in the city, but among people in London. The committee thought the accommodation for the firemen would have to be in flats; but the architects had shown that they could put self-contained houses on the site, and that plan of the three was the one which secured the prize. The report was adopted.

**BRISTOL.**—The Libraries Committee have again considered the difficulty which had arisen with regard to plans for the library for North Bristol, to be erected in Cheltenham-road. The committee formulated their requirements with the aid of the city engineer, and invited all the Bristol architects whose names appear in the Directory to enter the competition by sending in designs. Some plans were received, but the great majority of the members of the profession stood aloof, pending the result of a request that the committee would appoint an architectural assessor to adjudicate on the various drawings. The Libraries Committee were much surprised at this request, considering that experience gained in connection with public libraries over a number of years qualified them to say which plan best suited their requirements, and flatly declined to appoint an assessor. Negotiations have taken place with the architects' society; but the Libraries Committee have resolved to stick to the position they have assumed. The committee have received a certain number of plans, and the intention is to proceed to the consideration of these. It does not seem probable that a satisfactory design will be selected under such conditions.

**MILLBANK ESTATE DWELLINGS.**—At Tuesday's meeting of the London County Council, the Housing Committee reported as follows:—"On Nov. 16, 1897, the Council approved the conditions upon which certain selected architects were invited to send in competitive designs for a specimen block of dwellings which, if found suitable, might be erected on a plot of land on the Millbank Estate, Westminster. On the same day the Council voted a sum of £300, and authorised us to divide it between the competitors in such proportion as the assessor, Mr. W. D. Caroe, should determine. We have now to report that the assessor has made his award, dividing the sum of £300 between five competitors in the following manner:—Spalding and Cross, £150; Joseph, Son, and Smithem, £75; Howgate, Leeds, and Keith, £25; H. W. Dobb, £25; Gibson and Russell, £25. We are considering as to whether it will be possible to erect a block of dwellings according to Messrs. Spalding and Cross's plans without incurring any charge upon the county rate, and as to this we will report later."

Mr. Robert H. Bicknell, Local Government Board inspector, held an inquiry at Tong, between Leeds and Bradford, on Friday, with reference to the district council's application for sanction to borrow £1,000 for works of sewerage.

Mr. Joseph Marden Gribble, a builder, of Newton Abbot, 53 years of age, on Sunday walked to Chudleigh and preached there. His wife drove to Chudleigh Bridge in the evening and returned with him. The following morning he was found hanging, quite dead, in a loft at the rear of his premises. At the inquest in the evening, it was shown that, although he had been in financial difficulties for many years, Mr. Gribble's position lately had very much improved. A verdict of "Suicide while temporarily insane" was returned.

VICTORIA DIAMOND JUBILEE MEMORIAL, SINGAPORE.  
(For description see p. 367.)

## HOUSES AT HAMPSTEAD.

RED bricks of a good colour, with fine mortar joints, were used for the facings of the lower parts of these houses, and for the centre of one pair, as shown, the plastered upper portions are rendered in Portland cement, with fine white marble chippings thrown on. The roofs are covered with red tiles. The halls and staircases are panelled in painted wood. Mr. James Tomblin was the builder, the work being executed from the designs of Mr. W. F. Harber, architect.

## PENCIL STUDIES OF CARVINGS BY CHARLES BIACONI.

We are again indebted to Sir Charles Robinson for the loan of the pencil drawings which we have reproduced to-day. They were made in Italy by Charles Biaconi, and form a part of a series which, judging from the title page accompanying them, was prepared for James Barry, R.A., who was born in 1741 and died in 1806. These sketches appear to have been chosen with the view of providing the painter with detail studies of ornament, and as such they cannot fail to be interesting. They may have been intended for publication, seeing that the sketches are set out on sheets of uniform size. When in Rome, Barry's chief studies were directed to the antique statues and marbles, and in 1777, after his offer to decorate St. Paul's Cathedral had been declined, he undertook the ornamentation of the meeting room of the Society of Arts in the Adelphi. On this gratuitous labour he devoted seven years of his life. The subjects chosen illustrate human culture, and this series of works forms undoubtedly his best monument. It consequently claims a special notice in the history of art. The paintings are six in number; four are 15ft. long and two are 42ft. long, and all just upon 12ft. high. They exemplify the great truth "that the attainment of happiness, individual as well as public, depends on the development, proper cultivation, and perfection of the human faculties, physical and moral." Their treatment and accessories are appropriate to the Society whose meeting-room they enrich. The first is of Orpheus reclaiming mankind from a savage state; the second is a harvest home or thanksgiving to Ceres and Bacchus; "The Victors of Olympia" is the subject of the third picture; "Navigation, or the Triumph of the Thames" comes fourth; the fifth depicts "The Distribution of the Society's

Rewards"; and the sixth, "Elysium and Tartarus, or the State of Final Retribution." These paintings were etched on a large scale after their completion in 1784. Barry, always a very poor man, was soured by want of success, and he quarrelled with his contemporaries. He attacked their work in his Academy lectures, and was, in consequence, removed from his professorship; subsequently, in 1799, he was dismissed from his membership of the Royal Academy altogether. Poverty always embittered his career, and therefore it is little likely that he was at any time in a position to pay a commission to a draughtsman like Biaconi, and it is not known under what conditions these drawings were made. Barry was the victim of a temper that never yielded, and adverse criticism only produced wilful obstinacy; but, for all that, he inured himself to a life of lonely pecuniary independence in order that he might work out that which he considered the true aim of his art. Wrong-headedness had much to do with his lack of worldly prosperity, but no one can doubt his thoroughness of intention or his ability. After laying in state at the rooms of the Adelphi, he was buried in St. Paul's Cathedral midst the distinguished of his time and the great ones of his art.

## BAROCHAN HOUSE ADDITIONS, RENFREWSHIRE.

OUR illustrations show extensive additions completed recently from the plans and under the supervision of Mr. Charles S. S. Johnston, architect, of Edinburgh, at Barochan House, Renfrewshire, one of the seats of Mr. Charles Bine Renshaw, of Barochan, member of Parliament for the western division of the county, and the first chairman of the Association of County Councils in Scotland, who, with Mrs. Renshaw, was lately the recipient of a number of handsome gifts on the occasion of their silver wedding, presented by the Renfrewshire Hunt, the County, the tenantry of Barochan and Garvocks, the tradesmen and employés, and others. The older part of this mansion dates back to the 16th century, when it was erected by the Flemings of Barochan, an old family in whose possession it remained until the death of its last surviving representative of the name in the middle of this century, when it passed by inheritance to their relatives, the Hamiltons of Craighlaw; and after another change was acquired by its present proprietor, who has carefully preserved all its older features. It still retains such interesting features as the vaulted cellars and kitchen, the tower with turnpike stair, and a priest's chamber or hiding-place, used in "Reformation" times. The new additions comprise a large block of buildings on the north side, with one-storied kitchen offices and recreation-hall on the right, and entrance-hall, business room, upper hall, billiard-room, and suites of bedrooms on the left. The principal entrance-door—which in the original building was under the tower—had in the early part of this century been changed to the south front, but has now been moved back to the new north front, and the old entrance-court is converted into a flower-garden, containing a red sandstone sundial. The new entrance courtyard is inclosed on two sides by a massive Dumfriesshire red sandstone balustrade, and the whole of the new hewn work is built of the same kind of stone, while the rubble walls are rough-cast with Portland cement. The finishings of the halls and billiard-room are of oak, and the recreation-hall has a Burmese teak floor supported by an ingenious arrangement of railway buffer-springs, which give the floor an agreeable spring of about  $\frac{1}{2}$  in. for dancing purposes. A range of old useless cellars that extended along the whole west front on the face of the cliff and below the ground-floor level has all been utilised for the kitchen offices by simply driving a stair and passage through the solid rock behind them, and the new kitchen court there is paved with tar macadam. The whole mansion is lighted by electricity, engineered by Mr. Thomas Young, C.E., of Glasgow. The mansion stands in extensive policies, abounding in ancient trees; and, besides these additions, the proprietor has erected a new gate lodge and gates, laundry offices, and an ornamental stone bridge over the burn which flows through the grounds, from plans by the same architect. The contractors-in-chief were Messrs. Anderson and Henderson, Glasgow, and the clerk of works Mr. James Allan, of Leith; whilst Messrs. Thomson and Wright, consulting sanitary engineers, of Edinburgh, were associated with the architect in the carrying out of the drainage, sanitary arrangements, and water supply.

## NEW PREMISES IN NEW OXFORD STREET, ON THE SITE OF BEDFORD CHAPEL.

THE building now in course of erection on the site of the late Bedford Chapel, New Oxford-street, from the designs of Mr. G. D. Martin, architect, 3, Pall Mall East, S.W., is constructed so that the ground floor, basement, and mezzanine floor could be let as a whole, if desired, or divided into eight shops on the ground floor with stores in the basement, and showrooms on the mezzanine floor. It has frontages to New Oxford-street, Shaftesbury-avenue, Phoenix-street, and Dyott-street respectively, and will consist of eight floors, inclusive of basement. The shops will be separated by red granite pilasters. The principal elevation fronting New Oxford-street is surmounted by two handsome turrets, and the whole will be constructed of red brick and Portland stone. The upper floors will contain 32 suites in all, nine being family and 23 bachelor suites, there being a large kitchen on the top floor, with lifts for the service of the latter. The floors and partitions will be of fire-proof construction. The building will be lighted by electricity, and there will also be a hydraulic passenger lift. The contractor is Mr J. Carmichael, of Wandsworth.

## NEW LIBERAL CLUB, BLACKPOOL.

THE foundation-stone of the above club premises was laid by Earl Carrington on March 16th of last year, and they will be formally opened during the present month. The premises are situated in a very central position in the town (Victoria-street), and have frontages to two streets. The ground floor is utilised for shop purposes. The facing of front is of solid ashlar from the Nelson quarries. The rear elevation is of Accrington pressed brick, with Nelson stone dressings. The accommodation on the first floor includes the reading-room, smoke-room, assembly-room, and secretary's office. On the second floor is placed the card-room, billiard-room (with accommodation for four tables), and the steward's room. A lift runs from top to bottom. A feature of the building is the stained-glass staircase window executed by Messrs. Swain, Bourne, and Son, of Birmingham, in which are introduced excellent representations of the late Mr. Gladstone, Lord Rosebery, Sir Wm. Harcourt, and Mr. John Morley. The usual conveniences are placed on each floor. The total cost, inclusive of land, amounts to £8,000. The contract was let to Mr. S. Butterworth and Sons, of Blackpool. The plans were prepared by Mr. Herbert Wade, of Blackpool, under whose superintendence the work has been carried out.

## SKIPTON COTTAGE HOSPITAL.

THE block plan given with the view of this building, printed among our illustrations to-day, displays the general arrangements. Male and female wards right and left of the administrative block in the centre, a very usual disposition of parts, and the sanitary provisions contrived in external pavilions. The laundry and mortuary are located in a distinct building to the left of the hospital. Mr. Edward C. H. Maidman, of Edinburgh, is the architect.

## SALE-ROOM SKETCHES OF FURNITURE.

THESE sketches were recently made at Messrs. Christie's Rooms in King-street, and comprise a gilt chair carved with graceful sweeping scrolls, the back being surmounted by a crown. The oak chair is of Charles II. period, carved at top and bottom rail with cherub and floral design. It has spiral legs, with cane seat and back. The armoire of walnut, with folding doors, the upper portion carved with cherubs, foliage, and birds; the panels to doors are also carved, and with terminal female figures and leaf design.

\*\* THE photographic processes of reproduction are now so available that we venture to suggest that in many cases it is hardly worth while to send us drawings for reproduction. For measured work, for details, competitions, and the like, the services of the draughtsman will, of course, always be indispensable; but for average executed buildings, statuary, furniture, &c., a photograph is frequently in every respect as useful; and as, generally speaking, it would occupy less space, we should be able to give more subjects—especially in cases where the indifference of the drawing not infrequently influences the rejection—of churches, chapels, villas, &c.

The new English Church at Lucerne will be dedicated by the Bishop of London on April 14.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, AND SIXPENCE FOR EVERY EIGHT WORDS AFTER. All Situation Advertisements must be prepaid.

## NOTICE.

Bound copies of Vol. LXXV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXI., XXXII., XXXIII., XXXIV., XXXIX., XL., XLIV., XLV., XLIX., LI., LII., LIV., LV., LIX., LX., LXI., LXII., LXIV., LXV., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., and LXXV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

## Correspondence.

## THE MILLBANK COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—May I ask you to be so kind as to publish the inclosed letter which I have addressed to the Clerk L.C.C. ?—I am, &c.,

ROBERT WILLIAMS.

20, Northbrook-road, Lee, London, S.E.

## THE MILLBANK COMPETITION.

SIR,—After four months and a-half the award in the above competition is just to hand.

May I point out that the mere announcement of the five premiated designs is scarcely the fair treatment which might reasonably be required at the hands of the London County Council?

Believing that the L.C.C. always desire to act fairly, I feel certain that it will give the following its immediate attention:—

1. All the designs should be exhibited (mine being, probably, the worst finished of the lot proves the sincerity of my request).

2. The assessor's report, especially as to the designs which he considered "prima facie suitable" to forward for estimation by the "officers of the Council," and generally as to the whole matter, should be published.

3. The report of "the officers of the Council" to whom the "prima facie suitable" designs were submitted, should also be published.

4. The award as to the money is against the conditions, which state that:—"A sum not exceeding £300 will be awarded among the competitors in such proportion as the assessor may determine."

The plain meaning of these words can be no other than that the £300 to be divided amongst the whole of the

competitors in varying sums as the assessor should determine; and it was after reading them in this light that I entered, at the request of the Council, into the labour and expense of this competition.

The assessor, as an architect, has my sincere respect.

I am, Sir, yours faithfully,

ROBERT WILLIAMS.

To the Clerk of the London County Council.

March 14, 1899.

## LEEDS MARKETS COMPETITION.

SIR,—I inclose copy of a letter from the President of this Society to the Lord Mayor of Leeds re the Leeds Markets Competition, and I shall be pleased if you could insert it in your next issue.

—I am, &c.,

FRANCIS D. BEDFORD, Hon. Sec.

Leeds and Yorkshire Architectural Society,  
Leeds, March 13.

Leeds, 13th March, 1899.

MY DEAR LORD MAYOR,—As President of the Leeds and Yorkshire Architectural Society, and representing the views of the council of that body, I wish to call your attention, and also that of the chairman of the Markets Committee, to the "Conditions to be observed by competitors" in the pending competition by architects for the proposed market-hall and market shops in Vicar-lane.

These conditions are dated from the borough engineer's office; but they have evidently been drawn up by someone who is utterly inexperienced and ignorant of the terms upon which architects will enter into any such competition.

I inclose a copy of these conditions.

Referring to condition 8, it is promised that the drawings will be submitted to a professional assessor.

In order that competitors should have confidence in the judgment of the assessor, it is much to be preferred that he should be nominated before the issue of the conditions; that he should prepare the conditions, and that his name should be made known to the competitors.

The assessor is to select six designs as the best of those which he considers comply with the conditions, placing them in order of merit.

These six designs will be submitted to the Markets Committee, but the committee reserve to themselves the right to select any three out of the whole number of designs submitted in competition, and to award the prizes as their own judgment may dictate.

In view of that condition, one fails to see the use of an assessor at all.

It is to be presumed that the Markets Committee desire to have the best building they can possibly obtain, by means of competition of competent architects.

But the above quoted "conditions" opens the door wide to the selection of a design by personal influence rather than by merit.

There is, no doubt, in condition 14, a paragraph which I quote, "Any attempt to influence members of the corporation will be a disqualification." That is well; but how is the attempt to be discovered and proved? "No motto, device, or distinguishing mark must be used." That is also well; but designs can be seen and well noted before they leave the architect's office.

I well remember in a certain competition in this city that the then members of the corporation were invited to view certain designs before they were sent in.

There are throughout these conditions many things which are objectionable to those who desire to compete, but I do not propose to enumerate them.

I would, however, draw your attention to Condition 5, which has evidently been drawn up by someone utterly ignorant of architectural technical terms.

"Geometrical drawings of the basement and each floor, coloured in the ordinary manner."

"Geometrical sections coloured in the ordinary manner, and on the lines and of the number necessary, &c."

What other method than geometrical can be used for plans and sections, and what is the ordinary manner?

No elevations are asked for, but "four perspective drawings, two showing two front elevations, and two showing internal elevations."

There has certainly been a confusion of mind here; but, apart from that, it is the fact that perspectives are now absolutely prohibited in all well-conducted competitions, for reasons which are well known.

Having in view that the proposed building is intended by the markets committee to be of "first-class quality, and of ornate character," I would submit that, in order to attain that object, the committee should reconsider the matter, withdraw the conditions and appoint an assessor who would advise them in the general conduct of the competition, prepare revised conditions, and guide them to a proper selection, avoiding all personal influence.—I remain, my dear Lord Mayor, yours respectfully,

GEORGE CARSON, President.

FRANCIS W. BEDFORD, Hon. Sec.

Leeds and Yorkshire Architectural Society.

P.S.—I propose to send copies of the above letter to the chairman of the markets committee, the local and professional papers, and the Royal Institute of British Architects.

## SANITARY SAFETY.

SIR,—Many and varied are the efforts made to obtain this nowadays. Houses are surveyed, inspected, and tested over and over again, until the owners must really begin to look upon it as a weariness to the flesh. It would be amusing, were it not too serious a matter, to consider how much of this testing is more misleading than really useful, even when carefully done by trained and qualified men. The so-called testing performed by inexperienced and interested people is, of course, unworthy of consideration.

It is curious how difficult it seems for some people to grasp the fact that it is foul air we are

fighting. Nothing is more common than to see a beautifully-finished plan, with all the sewage drains coloured red and all the R.W. drains, in direct communication with them, coloured blue, the designer failing to realise that it is not so much what passes down as what comes up a drain (in the shape of foul air) that is the insidious foe! Often I have found the drains themselves quite sound, while no attempt had been made to render the access chambers—an integral part of the drainage—air or even water-tight. As the Indians say, "Water never sleeps!" There is something honest and searching about water, and the hydraulic test is positive and excellent, so far as it goes. But it does not test manhole covers when fixed in place, nor in an occupied house does it test any higher than the lowest connection to a vertical soil-pipe. Then, again, smoke, and all smell tests, simply give negative results, and the surveyor reporting after their use generally employs some such words as, "No leakage was detected," which may or may not be satisfactory. The only positive test which enables us to say at once, "The sanitary system of this occupied house is sound and airtight from disconnecting chamber to tops of the ventilating pipes, including every joint and connection," is the pneumatic test. It shows instantly air leakages which water only shows very slowly, if at all, air passing readily and at once through tiny interstices practically impervious to the passage of water.

I have quite come to the conclusion, after very many years' practical testing, that a sanitary survey without this test is unworthy of the name, and, in short, not worth paying much for.—I am, &c.,

CHAS. E. GRITTON,  
A.M.Inst.C.E., Mem. Soc. Architects.

## CHIPS.

An extensive fire occurred early on Tuesday morning upon the premises of Messrs Wake and Dean, school and church furniture manufacturers, St. George's Market, London-road, Southwark. It first appeared in a range of buildings used as workshops, stables, and stores, covering an area of 80ft. by 26ft., and this was destroyed. A large stock of timber, both in buildings and in the open yard, was severely damaged, but the front premises and offices are practically uninjured.

The Davis Memorial Institute at East Compton was opened on Tuesday. It is built of Cattybrook bricks with Bath stone dressings, and is fitted up in pitch-pine. The cost has been about £800. Mr. T. B. Bradford, of Brigstocke-road, St. Paul's, Bristol, was the builder.

The city council of Bristol decided on Tuesday to borrow £16,000 for work of wood-paving in various main streets in which the tramways company are about to reconstruct their lines.

At the annual meeting of the Staffordshire County Council, on Tuesday, £35,000 was voted for the completion and equipment of the lunatic asylum buildings at Chaddleton, in addition to the contract figure of £165,115.

The electric-lighting committee of the Edinburgh Town Council recommended, on Tuesday, estimates for acceptance in connection with the M'Donald-road power station, for slater, plasterer and concrete, glazier, smith, and plumber work, amounting in all to £5,003.

There was formally opened in Falkirk, on Tuesday, a model corporation lodging-house. The building, which is erected in East Bridge-street, is of three stories in height, and contains 170 beds, besides large dining-hall, reading and recreation rooms, keeper's house, &c. The cost was £4,500.

A public inquiry was held by the Light Railway Commissioners, at the Westminster Guildhall on Wednesday and Thursday, into the applications made by the Metropolitan Tramways Company for orders authorising the construction of the Highgate, Finchley, and Woodgreen Light Railway, and the Finchley, Hendon, and District Light Railway. A somewhat similar application was rejected in 1897. The present line will, if sanctioned, start from Brondesbury, close to the stations on the North London and Metropolitan Railways, and with a branch through Cricklewood, run through Hendon, Finchley, Hornsey, and Islington, to a terminus in the Archway-road, near the terminus of the London County Council's Tramways. The line will be a little over ten miles in length, and the cars will be driven by electric power on the overhead trolley system. The cost is estimated at £200,000.

At a town's meeting held in Liverpool, on Monday, it was decided to erect a memorial to Mr. Gladstone, and a committee was appointed to carry out the scheme. Subscriptions amounting to over £2,600 have already been announced.

## Intercommunication.

### QUESTIONS.

[12210.]—**Scraping Stonework and Marble.**—I should be obliged if any practical readers will give me advice as to cleaning stone and marble work. The stone (Portland) is very discoloured with rain and soot, and streaks of black spoil the surface. Will scraping be a good plan, or will it destroy the surface? Is there any means of washing the stone? The surface of the white marble is rough, and the smooth face it once had is gone. It is also discoloured, and black in parts. How should this be treated?—LIMESTONE.

[12211.]—**Warming by Hot Water.**—Is there any rule by which the length of pipe and size of pipe for heating a room can be estimated?—NOVICE.

[12212.]—**Excavating Trenches for Drains.**—What is a fair price in London per cube yard digging trenches, part filling and ramming, for drain pipes? The ground is stiff clay, and the trenches about 4ft. deep.—A. A. X.

[12213.]—**Greenhouses.**—What would a small greenhouse or conservatory 12ft. by 7ft. cost, of lean-to construction against a house wall? One end would open into the dining-room, the other end would have a door.—BETU.

[12214.]—**Pressed Facing Bricks.**—Have pressed facing bricks any merit over ordinary well-burnt bricks, except that, of course, they are truer and smoother on the surface? I should like to learn from someone who has used pressed bricks, of their advantages, and price.—A COUNTRY BUILDER.

### REPLIES.

[12206.]—**Light Areas.**—There are polished reflectors made, like those of Chappuis, which are hung at the bottom of the windows in the light area at a certain angle, to reflect the light into the rooms. If the rooms requiring light are on the lower story, reflectors would not be of much value. What is necessary is to bend the rays of light inwards, if possible, by some refracting medium. The Luxfer prism lights actually do this: the light from the sky is bent inwards through the window at any desired angle. For light wells or areas such as "Offices" referred to, the Luxfer prism is more effective than any form of reflectors as the rays of the light from sky are actually refracted into the rooms without undergoing any appreciable loss. For a light area of five stories, the prisms required will be those known as "Canopy" prisms. Probably the "A" prism is necessary. The slope of the canopy over the window will have to be determined by the length of room and the position of desks, &c. These canopies of Luxfer prisms can be fixed at any angle. If sloped at 50°, the light thrown in horizontally is greater than it would be for a greater angle. Apply for particulars at the Luxfer Prism Syndicate, Hull-street, Finsbury.—G. H. G.

[12207.]—**Deal Architrave Moulding.**—This kind and size of moulding must be priced at per foot cube fixed. The price would be about 5s. per foot cube fixed complete.—A. B.

[12209.]—**Stiffening Floor.**—Remove flooring boards, and insert two or three rows of herringbone or solid strutting, and furr the joists where they have sagged. Before the strutting is inserted, the floor should be well supported from below. A jack-screw may be used for this purpose.—STAVITER IN MODO.

[12208.]—**Dilapidation.**—A covenant to repair generally means to keep and leave the house in substantial repair, according to the nature and state of the building. Of course, a lessee is not expected to renew or restore what has been decayed and worn out by age, or to put an old house into the same state of repair as a new one. The term "tenantable repair" means good tenantable repair, having regard to the age of the premises, which can be inquired into by a jury. The terms "habitable" or "tenantable repair" have been defined by the Court of Appeal to have the same value. The official referee said, "I am of opinion that, under a contract to keep the premises in tenantable repair and leave them in tenantable repair, the obligation of the tenant, if the premises are not in tenantable repair when the tenancy begins, is to put them into, keep them in, and deliver them up in tenantable repair." He defines the term as "such a state as to repair that the premises might be used and dwell in, not only with safety, but with reasonable comfort by the class of persons by whom they were occupied."—G.

The Roman Catholic Bishop of Southwark laid the foundation-stone of the new church dedicated to St. Agatha, at Kingston-on-Thames, on Saturday.

The commission for the Byron statue to be erected in Aberdeen has been given to Mr. MacGillivray.

Sir John Taylor, consulting surveyor of the Office of Works, having been requested by the War Office to advise that Department in respect to the construction of barracks, he is now, with Colonel C. M. Watson, Deputy Inspector-General of Fortifications, examining some of the most recently-built home barracks.

The town council of Newport, Mon., at their meeting on the 14th, confirmed the recommendation of the Visiting Committee, appointing Mr. A. J. Wood, 22, Surrey-street, Victoria Embankment, W.C., architect for the asylum proposed to be erected for the borough. Mr. Wood, who has recently completed the Middlesbrough Borough Asylum, is now engaged on plans for extensive additions to the Suffolk County Asylum, and is also architect for the conversion of the late Colonel North's mansion at Avery Hill into a private asylum.

### LEGAL INTELLIGENCE.

**CLERK OF WORKS.—CLAIM AGAINST AN ARCHITECT.**—His Honour Judge Woodfall, of Exeter County-court, on the 8th inst., had before him an action brought by A. J. Wilkins, late clerk of the works at the Devon and Exeter Hospital, against Mr. Charles Cole, of Exeter, the architect, for £68, commission at the rate of 1½ per cent. for preparing three bills of quantities and specifications in connection with the new out-patients' department. A sum of £50 was paid into Court. Mr. Dunn said the agreement to pay the 1½ per cent. was verbal, but was made in the presence of Mr. A. E. Boyce, late secretary to the Hospital. Mr. Cole was to receive 2½ per cent. on the estimates, and to pay Mr. Wilkins the 1½ for making out the bills of quantities. The total estimate was £4,550. Some friction arose, the tenders for the work were annulled, and the scheme abandoned. Mr. Cole, however, would receive his 2½ per cent. all the same. Mr. Boyce said owing to the dispute between the parties he invited them in the interest of the Hospital work to settle the matter, and he would act as umpire. It was agreed that plaintiff should receive 1½ per cent. on the bills of quantities, but nothing was said about the specifications. It was stated that Mr. Cole was contesting the action in the interest of the Hospital, who would have to repay him if a verdict was given against him. He had paid £50 into Court as a reasonable settlement of the claim. His Honour gave judgment for plaintiff for £7 in addition to the £50, this being at the rate of 1½ per cent.

### PARLIAMENTARY NOTES.

**METROPOLIS MANAGEMENT ACTS AMENDMENT BILL.**—The Standing Committee of the House of Lords met on Tuesday, the Earl of Kimberley in the chair, to consider the Bill, as amended in committee, to amend the provisions of the Metropolis Management Acts with respect to by-laws. The Bill proposes to authorise the Council to make by-laws requiring persons about to construct, reconstruct, or alter drains to deposit plans and particulars with the sanitary authority before the work is commenced, alterations in cases of emergency being excepted. Lord Monkswell, whose name appeared on the back of the Bill, explained, in answer to the Earl of Camperdown, that hitherto, as he understood, there had been no power to compel persons about to construct, reconstruct, or alter drains to give notice of what they were going to do, although if the sanitary authority found out afterwards that the work had been done in a faulty manner they might insist on the drains being pulled up again. The alterations in the law which this Bill made was therefore really for the convenience of the occupier. Several drafting amendments, proposed by Lord Harris on behalf of the Local Government Board, and by Lord Monkswell, having been agreed to, the Bill passed through committee.

### WATER SUPPLY AND SANITARY MATTERS.

**LONDON WATER COMMISSION.**—At Thursday's meeting of the Royal Commission, an important announcement was made by Mr. Balfour Browne, Q.C., counsel for the London County Council. In reply to an inquiry by the Chairman, Viscount Llandaff, as to whether the County Council desired the Commission to find that purchase of the undertakings of the Water Companies would be expedient on any terms of arbitration, or that purchase would be expedient upon certain special terms of arbitration, Mr. Balfour Browne said that in the opinion of the County Council it was expedient to buy out the Companies upon special terms of arbitration. The Council desired to point out that, as their definite proposal was now before Parliament, and in view of the fact that their witnesses might soon be called upon to substantiate it before a Committee of the House of Commons, it was impossible to say anything that might be construed to commit the Council to accept any terms of arbitration that might be imposed upon them. At the same time, it did not necessarily follow that the precise clause contained in the present Bill would afford the only means of obtaining fair terms of arbitration. The contention was that the fair value of the Companies' undertakings should be ascertained by a court of arbitration of the highest standing, with the fullest powers to inquire into all the circumstances of each individual case. Mr. Urban A. Smith, engineer to the Herts County Council and Mr. Baldwin Latham, the consulting engineer, were then examined with regard to the exhaustion of the springs in Hertfordshire. At Wednesday's sitting of the Commission the evidence was completed, and counsel addressed the Commission on behalf of the Hertfordshire County Council and of several of the water companies. The Commission adjourned until Monday next.

Mr. J. G. Chittenden has been appointed surveyor to the rural sanitary authority of Faversham at a salary of £200 a year.

## Our Office Table.

On the invitation of Mr. Forbes, Her Majesty's Commissioner, Mr. William Inkster, firemaster of Aberdeen, accompanied by Bailie Lyon, of the Aberdeen Town Council, visited Balmoral on Friday to inspect and report on the fire appliances at the castle and its offices. Messrs. Inkster and Lyon were met by Mr. Anderson, clerk of works, and were conducted over the establishment. At various points round the Castle proper it was found that there are about a dozen hydrants, the most of them having all the needful accessories, such as standpipes, hose, and nozzles. The water supply, which comes from Lochnagar, is stored in a reservoir on an adjoining hill about 150ft. above the Castle, and runs with a pressure of about 50lb. to the square inch. Inside the building, however, the arrangements were not so adequate. With the exception of several chemical extinguishers, none of the many corridors, either upstairs or downstairs, is provided with apparatus to grapple with a serious outbreak. Corridor engines, in the shape of hand pumps, and an increased supply of chemical extinguishers of modern type, will probably be recommended. The castle is at present partly lighted by electricity and by May the installation will have been carried to the upper rooms. This, of course, will still further reduce the risk of fire. The latest addition to the buildings at Balmoral—the Garden Cottage—where Her Majesty frequently breakfasts, was visited, and also Karim Cottage, the private residence of the Indian secretary, which has no appliances at hand for the suppression of fire. The byres, stables, laundry, and gardener's cottage were inspected in turn, and their requirements noted; and before leaving Mr. Inkster drilled the servants on the estate in the use of the fire apparatus. Mr. Inkster will prepare a detailed report for Mr. Forbes.

New marble quarries are being opened out at Lower Umzimkulu, Natal, and are being exploited in the South African Republic by a syndicate. A bed of rich white marble has been traced for a distance of a mile and a half, and there are facilities for transit by rail and sea, and, according to the Transvaal newspapers, is said to be as fine as the statuary marble of Carrara, and to be worth from 10s. to 40s. per cubic foot, and the colour is less yellow than that from the Italian quarries, while from the absence of cold and frost the material is free from fractures. Mr. Harry Hems, however, writes to us: "I had an opportunity for examining these quarries when in Natal last summer; they are undoubtedly good, but to say that they produce statuary marble equal to Italian is a colonial 'slinger.'"

The crusade against high buildings goes on vigorously in the United States. In Washington it is proposed to limit business buildings to a height of 110ft., or 130ft. where they front on a street not less than 160ft. wide; while no building on a residence street must exceed 90ft. in height. Apartment-houses and hotels more than 60ft. high must be fireproof, and business buildings more than 75ft. high must also be fireproof. In Boston, Mass., a law has been brought before the Legislature which limits buildings within a radius of 1,000ft. from the dome of the State house to the height of the main cornice of that building in those cases where the present general law would allow them to exceed that height-level.

"INDIAN ENGINEERING" observes the only earthquake-proof structures in Japan are the pagodas, which are erected before temples. Many of these structures are seven or eight hundred years old, and as solid as when first built. The pagoda is a framework of timber on a wide base substantial in itself. Inside the framework and suspended from the apex is a heavy beam of timber 2ft. thick or more. This hangs from one end and forms an enormous pendulum reaching within 6in. of the ground. When the shock of earthquake occurs, the timber pendulum swings in unison, and keeps the centre of gravity at the base of the framework, by which action the equilibrium of the structure is maintained. Owing to this ingenious device, the pagodas resist the severest shock, and many of the highest are of a great age.

STUDENTS who are engaged in architectural, surveying, and engineering work generally, may find some useful help in the catalogue issued by

Mr. A. G. Thornton, of St. Mary's-street, Deansgate, Manchester, as directions are given for using the appliances that are not well known, and the student has the opportunity of buying a "case" adapted to a "set" of instruments, and adding the latter as his funds will allow. It is always better to buy a "case" only half furnished, and add instruments as opportunity offers, than to purchase a so-called cheap "case" at once. It is also wise for a student in any of the professions to obtain the best instruments, for inferior ones often lead to much vexation of spirit.

#### MEETINGS FOR THE ENSUING WEEK.

**MONDAY.**—Surveyors' Institution. "The Second Report of the Royal Commission on Local Taxation," by Col. G. W. Raikes, F.S.I. 8 p.m.

Liverpool Architectural Society. "Notes on American Architecture," by H. Bloomfield Bare, F.R.I.B.A.; and "New York Office Buildings," by James H. Cook. Leeds and Yorkshire Architectural Society. Election of Officers and Annual Report.

**TUESDAY.**—Society of Arts. "The Commercial Development of Germany," by C. Rozenraad, F.S.S. 4.30 p.m.

The Institution of Civil Engineers. Discussion on "Water-Tube Boilers for Marine Engines," and "Recent Trials of the Machinery of Warships." 8 p.m.

**WEDNESDAY.**—Society of Arts. "Electric Traction," by Philip Dawson. 8 p.m.

St. Paul's Ecclesiastical Society. "The Commemoration of John Potter at Westminster in 1522," by Mr. Leland L. Duncan, F.S.A., and "Two Manuscript Missals in the Bristol Public Library," by Mr. Cuthbert Atchley. 7.30 p.m.

**THURSDAY.**—Society of Architects. Discussion on "The Experiences of Architects in their Dealings with Local Authorities." St. James's Hall, Piccadilly. 8 p.m.

#### THE ARCHITECTURAL ASSOCIATION.

MARCH 25th.—VISIT to the BRITISH FIRE PREVENTION COMMITTEE'S FIRE-TESTING STATION, North Bank, near St. John's Wood Station (Met. Ry.). Three p.m. Students proposing to join the Association with a view to attending the courses of instruction next Session should forward their nomination forms to the Hon. Secs. before APRIL 26th. The Subscription of a member elected after April 30th covers the ensuing session.

E. HOWLEY SIM } Hon. Secs.  
G. B. CARVILL }

#### The Society of Architects.

Founded 1884. Incorporated 1893.

The FIFTH ORDINARY MEETING of the Society of Architects for the Session 1898-99 will be held at the Rooms of the Society, at St. James's Hall, Piccadilly, W., on THURSDAY, March 23rd, 1899, at Eight p.m., when a DISCUSSION will take place on "THE EXPERIENCES OF ARCHITECTS IN THEIR DEALINGS WITH LOCAL AUTHORITIES." At this meeting smoking will be permitted.

ELLIS MARSLAND, Hon. Sec.  
C. MCARTHUR BUTLER, Sec.

#### The Society of Architects.

Founded 1884. Incorporated 1893.

##### EXAMINATION FOR MEMBERSHIP.

INTENDING CANDIDATES for the Examination to be held on APRIL 12th, 13th, and 14th next, are reminded that the LATEST DATE on which application can be made is MARCH 23rd. Full particulars and forms of application may be obtained upon application. Copies of the last Examination Papers, &c.

ELLIS MARSLAND, Hon. Sec.  
C. MCARTHUR BUTLER, Sec.  
St. James's Hall, Piccadilly, W.

#### Trade News.

##### WAGES MOVEMENTS.

**ASSOCIATED CARPENTERS AND JOINERS.**—The 37th annual report of the Associated Carpenters' and Joiners' Society has been issued from the chief office in Edinburgh. The income has been £15,293 6s. 9d., an increase of £1,116 3s. 1d. over that of last year. The total expenditure has been £11,798 4s. 6d. Of this sum £3,751 8s. has been paid as sick allowance, in which 2,981 members participated; superannuation, or old-age pension, £1,150 13s. 4d.; funeral allowance, £687; tools compensation, £834 8s. 1d.; unemployed benefit, £816 19s. 5d.; strike allowance, £178 19s. 3d.; salaries and commissions, £1,330 1s. 3d.; disabled members' bonuses, £800, &c. The financial gain on the year's transactions was £3,500 2s. 3d., being the largest balance in any one year since the formation of the society. The capital account at October 31 had increased to £16,067 1s. 11d. Of this sum £7,902 1s. 1d. belongs to the trade section, £5,669 16s. 0d. to the sick section, £2,675 16s. 8d. to the unemployed, and £629 8s. 0d. to the benevolent and contingent fund. There are 163 branches, with 9,339 members, an increase of 657 over the previous year. During the year trade

has been good, and a number of members have received advances in wages and improved working rules. On the question of the Compensation Act, the committee say:—The Act bristles all over with legal quibbles, and appears to have been framed for the benefit of the legal profession and insurance companies. So far as our experience has gone, it has not been the means of preventing accidents. Also the compensation offered is quite inadequate—20s. per week being the highest compensation allowed. Another difficulty has arisen in connection with the Act, and that is the employment of old men. Some firms will not take on men over 50 years of age, especially if it is for outside work, thus throwing a number of workmen out of employment who are quite able and willing to work, but will not be allowed, as a higher premium has to be paid for them. In outside work in the building trade the question arises, What is a scaffold, and how far has a workman to fall before he can claim compensation? Some authorities hold that it matters not what distance a workman may fall, providing any part of the building is over 30ft. high; others that the fall must be over 30ft. before compensation can be granted. Then, where is the height of the building to be measured from? Is it from the foundation, or the ground around the building? Then, what is a scaffold? Must it start from the ground? If we can read between the lines according to some judgments given, planks 40ft. high, resting on a window-sill, or fixed to a ladder, are not a scaffold within the meaning of the Act. Again, if a workman works a machine without his employer's or his foreman's orders, and an accident occurs, that is construed to be serious and wilful misconduct on the part of the workman, and debars him from claiming compensation. We have mentioned these points so as to put our members on their guard so that they may not touch machines without direct orders, and refuse to go on a hanging scaffold, or scaffolding supported by fixtures on the wall. Should they do so, they know the consequences.

**THE PLASTERERS' DISPUTE.**—There is little fresh to be said in connection with the lock-out. The National Union of Operative Plasterers have resolved upon a levy of 3s. per week per member in employment, which comes into operation this week. The first of a series of district meetings, arranged by the London Master Builders' Association, was held on Tuesday evening at Stanley's Restaurant, Lavender Hill, Battersea. Mr. Henry Holloway presided, and Mr. Costigan, the secretary of the Masters' Association, outlined the condition of affairs, the meeting adopting resolutions in support of the employers. At the offices in Bedford-street on Wednesday, there was a sitting of the standing committee of the National Association of Master Builders. Mr. Holdsworth was chairman, and there was a good attendance. The proceedings were private.

**THE SKILLED LABOUR MARKET.**—The *Monthly Memorandum of the Labour Department* reports that employment was exceptionally good in February. The proportion of unemployed in the trade unions making returns was 2.6 per cent., against 3 per cent. in January, and 4.4 per cent. in February, 1898. In the building trades (plumbers excepted) employment has continued good. The furnishing trades have improved, and employment is now good in nearly all branches.

**BROUGHTY FERRY.**—The joiners in Broughty Ferry are working for 1d. less per hour than the Dundee workmen, and have applied for an increase of wages. The employers offer to concede an advance of ½d. per hour, but the journeymen consider this inadequate.

**DUMFRIES.**—The operative masons intimated to their employers on Saturday that they would not resume work to-day unless their demand for an increase of their wage from 8d. or 9d. an hour was complied with. The masters have refused the advance.

**NORWICH.**—The operatives in nearly all departments of the building trade in Norwich have made demands upon the employers for increased rates of pay and for other improved conditions of labour. The employers have the matter under consideration.

A new Wesleyan chapel and school is now being erected at St. Ives, Cornwall, and special consideration is being given to the ventilation, which will be carried out on the Boyle system.

The important modern pictures of the late Sir John Kisk came up for sale at Christie's on Saturday. The collection was a small one, comprising only 66 lots, which, however, realised the good total of £17,123. The highest prices of the day were obtained for Turner's "Port Raydael," 35in. by 47in., which was exhibited at the Royal Academy in 1827, and now fetched 4,800gzs., and Millais's "Minuet," hung at the Academy in 1867, and which brought 4,500gzs.

In the case of George Brough, of Langley Mill, Derbyshire, builder, the order of discharge from bankruptcy has been suspended for three years ending Feb. 7, 1902.

Aylesbury—Granite (16,000 tons)	Bucks County Council	R. J. Thomas, County Surveyor, County Hall, Aylesbury	" 31
London, S.W.—Broken Granite (6,000 tons of 2in.), Granite Chippings (750 tons), and Granite Dust (400 tons)	Middlesex County Council	H. T. Wakelam, County Engineer, Guildhall, Westminster, S.W.	April 4

## CHIPS.

The Bishop of Rochester will, on Tuesday next, unveil and dedicate a reredos which has been erected in St. Thomas's Hospital Chapel in memory of the late Sir Henry Doulton by his son. The work is in terracotta, and has been executed by Mr. Tinworth.

Mr. C. Burnby Bell, the son of Mr. Charles Bell, F.R.I.B.A., 3, Salters' Hall-court, Cannon-street, has been appointed an assistant engineer on the Ceylon State Railways. Mr. Bell has been engaged in a similar capacity with Messrs. Price and Wills, contractors, in Wales.

In the House of Commons on Tuesday night Mr. Chamberlain introduced the Small Houses (Acquisition of Ownership) Bill, which he explained was intended to extend to occupiers of small houses the same facilities for becoming owners of their houses which have been extended by legislation to the owners of small farms in Ireland, and to small owners of tenancies in this country. It was proposed that a sum of £240 may be advanced upon a house of the value of £300. The Bill was read a first time.

Last week's business at the Estate Market, Tokenhouse-yard Mart, was of an unimportant character, and the total amount realised, £115,621, was £49,733 less than for the corresponding week of last year. This was due to the limited supply of properties. Private treaty sales of the week included the well-known sporting estate of Inverlael, Ross-shire, of 20,000 acres, to Mr. W. Ewing Gilmore, of Woodbank, Dumbartonshire; the Mount Estate, near Crawley, 165 acres; and Lyne-grove, Virginia Water, 75 acres.

## FAMBRINI &amp; DANIELS,

MANUFACTURERS OF IMPERISHABLE CONCRETE MASONRY FOR

CORNICES, STRING-COURSES, MODELLED PANELS, AND EVERY STONE-WORK REQUISITE.

LANDINGS and Plain or Moulded and Mitred STEPS, durable throughout.

WORKS AND OFFICES: LINCOLN.

No order recognised unless issued from the works at Lincoln.

## PILKINGTON &amp; CO.

VOL. LXXVI.—No. 2307.

FRIDAY, MARCH 24, 1899.

## THE NEW WAR OFFICE AND GOVERNMENT BUILDINGS.

THIS week we have had the opportunity of again inspecting the drawings of the designs for these buildings, which have been on view since Tuesday to Members of Parliament in the tea-room of the House of Commons. The process of competition adopted by previous Governments when the Home and Colonial Offices and other public buildings were determined on, has in the present instance been departed from, as our readers know, and Messrs. J. M. Brydon and William Young were chosen by the Ministry to design the contemplated buildings without further contest, save the necessary ordeal of public criticism and Parliamentary opinion.

The result of the method adopted by the Government is, on the whole, satisfactory. Both the Great George-street buildings, for which Mr. Brydon is responsible, and the War Office, of which Mr. William Young is the architect, are eminently well adapted for the purposes intended, and unquestionably they will enhance the architectural dignity of London. The intention of the authorities has been rigidly adhered to, limiting the style to a Later phase of the English Renaissance, and the further restriction, which we understood would be imposed, as to an adherence more or less closely to historic examples in this country, may, we suppose, be offered as a reason for the absence of any marked originality in either of the designs now determined on. Well recognised forms and familiar details bring both compositions well within the lines of respectable achievement, while the plans which have in both instances been prepared in consultation with Sir John Taylor, the consulting surveyor of the Office of Works, no doubt admirably fulfil the requirements of the several departments to be housed. No room of any kind, save an occasional porter's office, is lighted from what are called the smaller internal areas, and even these little rooms obtain their light from the long-ways of such areas. Ample light is the characteristic of both schemes, and it is but fair to both architects to remark that, although their plans have been largely influenced by the Office of Works, the distribution and architectural contrivance of the planning is the work of the architects themselves.

In both buildings a governing condition which necessarily imparted a rule for the determining of the proportions of these designs must not be overlooked in reviewing them, and this was the stipulation that no rooms on the main story should be more than 16ft. high, the ground floor not more than 13ft., and generally the pitch of the rooms in other parts of the buildings 12ft. high. Thus the mistake made in the Home and Colonial Offices in having rooms 23ft., and even 25ft., high, is wisely obviated.

Mr. Brydon's building will extend up Parliament-street to Charles-street, having a frontage to Great George-street as far as the park, some 700ft. long, the Whitehall façade being about 320ft. The height of the elevations generally to the top of the parapet will be 80ft., and the cupola towers which flank the central pedimented pavilions towards Great George-street and Charles-street measure 145ft. high. Each of the four façades is terminated by square angle-towers, having an elevation of 110ft. On the Whitehall side these towers are located

at the extreme ends of the composition; but towards St. James' Park they set inwards with a curved treatment brought round between the main and end elevations of the block. This gives a pleasing diversity, and better befits the surroundings of this façade.

Towards Whitehall another feature in this respect must be mentioned, because it is of exceptional importance in more ways than one. We refer to the archways designed to connect the new buildings with the Home and Colonial Office in the front of Charles-street, and also the latter with the Treasury Building, higher up in the same thoroughfare, spanning Downing-street. Architecturally, this will be a manifest improvement. The ugly splay on plan taken by the south-east tower of Sir Gilbert Scott's building\* will be masked, and although the scale of Mr. Brydon's archway will scarcely accord with that of the Home Office, we would not suggest any alteration in this respect. The figure frieze above ranging along the covered passage is a pleasing feature, and may modify this effect of largeness of scale imposed by the big columns below. The practical utility of these archway screens is that they will enable the several departmental officials to visit either of the three buildings without leaving the premises; and, moreover, as the Home Office work will have, by reason of its increased extent, to overflow into the new building, this connecting passage-way is of prime importance. At the same time, all three buildings will remain distinct really, in case of fire.

Turning now to Mr. Brydon's plan, we may describe it as being grouped round three large courts. The two side courts are 105ft. long, running north and south, by 90ft. wide. In the centre is a circular court 160ft. in diameter, with carriageways from the main fronts, north and south, and these entrances form the distinguishing central features in the main fronts of the entire building before mentioned as being flanked by the cupola-capped towers. To some extent, no doubt, Inigo Jones's famous Persian Court in his design for the Palace at Westminster†, the geometrical studies for which are now in Worcester College, Oxford, has furnished Mr. Brydon with an idea for this circular court just mentioned. The diameter of the Persian court was 280ft., and it formed a sort of circular piazza, with Persian warriors supporting the first floor and female figures the main entablature above. Beyond their form on plan, the present court and Inigo Jones's design have nothing in common. The quiet dignity and reposeful treatment adopted by Mr. Brydon in designing this essential feature in his plan deserve much praise. The arched pediments rising above the main cornice, and so crowning the before-named carriage archways below, are very pleasing, and display a power of reserve in design, besides intimate acquaintance with the Classic work of Oxford and Cambridge.

The buildings along their leading frontages are four floors high above the basement, and including the mezzanine. The two lower stages forming the base are rusticated, and above this, through the main story and the floor above it runs an intercolumniation in the Corinthian order, with the principal floor windows flanked by Ionic columns, and crowned by alternating curved and straight gabled pediments. In the middle of each main wing the fenestration is grouped to give emphasis with swags in orthodox fashion to the windows above, a contrivance which is here nicely treated. The cupola-like turrets are set out in four stages above the parapet,

the main body having rusticated columns setting forward anglewise after the manner of Wren, and making the most piquant and telling features in the composition. Above the pediment in the centre of the façades between these towers rise plain Attics, and at the extreme ends of the elevations, as already referred to, are square towers with somewhat unduly attenuated pilasters, which somehow or other do not seem to harmonise with the rest of the design. On each face a three-light opening is comprised within a governing wall arch with blocked voussoirs, hardly making a satisfactory feature in this position at any rate. Sculptured figures break the line of the parapet in a judicious fashion between the Attic and these towers. The square end windows in the former, where they occur, are ungainly, and would be best omitted. The bas-relief figures between the coupled columns supporting the pediment in the Parliament-street front make an attractive break from the welcome severity of the wings. The rusticated piers to the main doorway on this front are unhappy in proportion, so that we are glad to note the alterations in this feature shown by the perspective, where disengaged and rusticated columns appear. The foliations and cartouche to the tympanum over, shown by the geometrical drawing, are, however, much to be preferred to the Lion and the Unicorn shown in the view, for this brings the portal down too nearly to the idea generally personified by the overdoor of an ordinary County Court.

These, however, are mere details. Many will no doubt prefer Mr. Brydon's English Renaissance façade to the Italian style embodied in Sir Gilbert Scott's building next it. Though less lofty by some ten feet, the intended front will look larger, and the proportions of the new building will be found much more satisfactory. Mr. John O. Scott has, we hear, been consulted as to the finishing of the end towers of his father's elevation, and square terminations, with groups of sculpture at the corners, will now be erected in lieu of the tall cupolas originally intended. The skyline also of the Treasury building will be improved, though it is doubtful if the structure will support the central Attic shown by the elevations now on view at Westminster. For the present only half of Mr. Brydon's block is intended to be put up, as the main frontage along Great George-street, including the Institute of Civil Engineers, has yet to be acquired.

At the War Office due account must be taken of the very great disadvantage presented by the irregular shape of the site, facing, as it does, on the longest side Whitehall-place, a return along Whitehall-avenue, and so round to the Horse Guards Parade, leaving a much shorter façade for the principal elevation towards Whitehall. This difficulty has been masked ingeniously by the introduction of circular towers at the four main corners of the block. They rise to a total height of 128ft., the general façades measuring 80ft. to the top of the parapet. The Whitehall-place front is 480ft. long. It is boldly treated in the centre with a colonnade pavilion inclosed within two wall turrets slightly breaking forward sufficiently for the purpose, and over these are dwarf cupolas, which in the view have been brought more forward, so as to properly exhibit themselves in front of the Attic, which is set some 10ft. back. The same arrangement of Ionic columns to the main stages of the façades, which occupy the central positions on each front, are also brought round the curved face of the towers at the angles between two subsidiary pavilions which run up, and end in segmental pediments, and having a sculptured trophy as a finish to the skyline of the Attic above. Four statues occur over the middle of the Whitehall front, which is over 240ft. long. The crowning feature of this front is made by a large equestrian group above the perfectly

\* Elevations and details of the Home and Colonial Office were published in the BUILDING NEWS for April 10, 1874.

† Facsimiles of Inigo Jones's drawings, reproduced by Mr. Maurice B. Adams from the originals now in the Royal collection at Windsor Castle, will be found published in the BUILDING NEWS for Dec. 19, 1884, with a plan of the whole scheme.

plain and receding Attic story. The entrance porch projects with rusticated columns as the centrepiece, and over its middle portal is a broken pediment of free design, the top of the projection being finished with inverted truss-like buttress scrolls which hardly come nicely in perspective. A striking proposal in connection with this design is to repeat Inigo Jones's Banqueting Hall on the north side of Whitehall-place, on the site of the office of the Woods and Forests, and to use that replica of the Stuart chapel as a Parliamentary library. The idea is architecturally fitting, though little likely to be realised.

For Mr. Young's plan we have nothing but praise, and its detail shows considerable skill. The carriage-entrance to his main quadrangle is from the Horse Guards Parade. This great court is 144ft. by 80ft., and on the north side it has a good feature in an open arcaded well to light the corridor to the rear of Whitehall-place front. To the back of the block there is a triangular court, following the lines determined by the frontages, and there are five other minor courts for light. The elevations are broadly handled, and in scale with Inigo Jones's work adjoining. The Ionic order implies a bigness and severity of handling. The Corinthian order employed for the fenestration gives delicacy and refinement. The ground floor and mezzanine story, if we may in this instance so describe the first floor, has rusticated masonry, and the jointings above in the view are also marked somewhat emphatically. The far-away angle towers are seen in the view in a manner hardly ever likely to occur; whereas in Mr. Brydon's perspective the Great George-street cupola towers do not appear, though from the point of view adopted, they certainly ought to have been shown. The Abbey is brought unjustifiably near, and rather destroys the effect of spaciousness, which in reality will exist. The views, however, are brightly done in Indian-ink wash, and the geometrical drawings are painstaking and carefully delineated without over-elaboration, for they are done in a workmanlike and suitable way.

If neither of the buildings can be described as brilliant or dashing original, they will make excellent public offices, distinctly removed from the mediocrity of the commonplace.

#### ROYAL INSTITUTE OF PAINTERS IN WATER-COLOURS.

REJECTION is neither an easy nor a grateful task, and committees of selection find it more difficult every year to exclude works of a commonplace or indifferent class. Hence it is, we suppose, that we have to take a large number of pictures of little merit with others of admitted quality in these galleries. The task would be rendered lighter for the critic if the former were absent; as it is, the process of "weeding out" is sometimes formidable. In the West Gallery of this well-known Institute we see a few works of interest. One of the best examples is J. Shaw Crompton's picture, an incident of the period of the Peninsular War, "For Country and King" (No. 2). The interior of an old-fashioned inn parlour; on a wooden table, the jovial host, his hand uplifted, welcomes a country labourer in smock, apparently a raw recruit. The recruiting officer sits on a chair, leaning on its back, while other guests are smoking and looking on. Carefully painted in its details of furniture and its homely country accessories, the painter has given us a genuine scene of Old English country life in the time of the Regency. Frank Walton's studies of the Channel Islands, including "Les Etats, Alderney" (6) and "Clonque Fort, Alderney" (14), are admirable renderings of those rocky fastnesses. Atmosphere and genial sunlight are well depicted. Then we have R. B. Nisbet's delightful and poetic symphony of

landscape under a bright twilight (7), pearly in the hues; and another melody in light and shadow, "Bringing Home the Stragglers," an undulating common under a wet, drizzly sky, full of breadth and atmosphere. Geo. Lucas's "Surrey Common" (8), F. Spenlove-Spenlove's "Evensong," Joseph Knight's "The Cotter's Field" and "Pasture Land" (15) are pleasant studies of landscape. A large and cleverly-drawn view of "Lynmouth" (16), by Harry Hine, must be noticed in passing. Very ambitious is Henry M. Rheam's picture, "The Sleeping Beauty." The young prince bends over her; but the drawing of the left arm of the maiden is faulty: it is too short from elbow. The composition, colour, and technique are promising of better results. Frank Dadd is always entertaining in his dry humour. "Small Fish are Better than no Fish" (18) tells its own tale. The scene, a country taproom, where a dandy attired in Georgian frogged coat is sitting smoking, stirring his grog, with two young post-boys; one in scarlet in the window recess is looking over his friend's hand. There is a self-satisfied look on the face of the expert player watching his younger friends, who are at their wits' ends. Mr. Dadd is here intensely natural and simple, as is his wont. There is no effort: the drawing and accessories of table and room are perfectly true. J. C. Dollman, another master of amusing incident, is exceedingly happy in his picture of "Moses at the Fair" (41). The light, open-air effect of the canvas-inclosed paddock, and the figure of Moses Primrose holding the halter of the old nag are admirable. Clad in his coat of "thunder and lightning" cloth and green vest Moses looks self-possessed before the two Jewish confederates, who stand looking on. Through the opening of a tent are seen metal-rimmed spectacles, a gross of which were given for the horse. For drawing of horse, grasp of character, and quiet humour this work is in Mr. Dollman's best manner. At the end of room, "An Idyll" (50), by Charles P. Sainton, is fanciful and delicate in its hues of misty sunlight. Seated on a bank near a lake, an undraped nymph, by the melody of her flute, has lured to her a flock of swans, whose graceful white forms are seen through the opalescent mist. "Waiting for the Tide" (85), by Walter Langley—an old sailor and his daughter—is replete with those qualities of realism and pathos which we look for in his work. Edward Davies's bold and vigorous mountain scene, "The River Mawddach" (90), with its naked rocks and scant clothing of verdure; Anderson Hayne's "A Full Stream" (133), Edmund Caldwell's clever study of a dog biting his muzzle, "A Conscientious Objector" (99), J. C. Halfpenny's "Blossom and Decay," an old boat in a reedy recess by the sea, very feelingly drawn, are worth notice. One of the ablest works in the gallery is F. W. Davis's "A Forgotten Craft," an old grey-bearded craftsman busy in making a leather jug, or a "black-jack," so common in Mediaeval times. Near the small casement of the workshop is another man, in red coat, decorating a "jack." The drawing and composition are powerful, the colour subdued and forcible, and the massed light and shadow masterly.

"The Lute Player" is the smallest contribution of Mr. E. J. Gregory, R.A., the president—a daintily-drawn figure of very charming colour of a girl seated, playing the instrument. Her dress is of a pinkish-red, richly worked. Behind is a hanging chocolate red. The technique and execution are unsurpassed. The larger circular study, "Pensive," a fair-haired girl, leaning on her elbow resting on her knee, wearing a large-brimmed hat in a garden, is a pleasing piece of realistic portraiture. The face, though not pretty or refined in its features, is nevertheless real and honest-looking. There is no affectation or coldness, and the striped canary blouse and figured dress suggest a

summer reverie. Sir J. D. Linton's contribution "St. Valentine's Morning" is a scholarly study of costume of 16th-century character—a youthful gallant, dressed in rich brocaded garments, his sword by his side, carrying a Cavalier hat, is knocking at the door of his sweetheart's chamber, while a neatly-dressed maid holds a tray of choice gifts, including a cupid. The execution and details are, it is needless to say, faultless. Of other pictures we note, E. M. Wimperis's vigorous landscape, "Ben Nevis," with its dark masses of colour and heavy clouds; some clever sketches by John Fulleylove (178), "The Erechtheum" and other views of Athens and the Acropolis; works by Harry Hine, J. Finnemore (176), Jas. Orrock, John R. Reid (193); G. Sheridan Knowles's graceful picture, "Dancing Lesson" (189); St. George Hare's piece of drollery and colour (200), a clever figure-study by Miss Gertrude D. Hammond (222), an expressive study of a girl's face by Lucien Davis (245); H. R. Steer's "Bartlemy Fair" is clever and animated, and Archibald's Kay's "The Quarry, Culross, Fifeshire" (402) is charming in its sense of light and shade and delicate tone. Lennard Lewis's "Church of Notre Dame, Honfleur," is a careful drawing; and we must also notice Carlton A. Smith's well-drawn work, "Daybreak" (328), with its pathetic touch. The figure of the young woman carrying a lamp, and the old volume and spectacles left on the table, in the early gleam of daylight, are convincing. The conflicting lights of lamp and dawn are very true. Yeend King has one or two bright and crisply-handled sketches: "Sandle Manor, Hants" (183), "Robertsbridge, Sussex"—an old village street in sunlight, "The Church Pool"—a quiet evening effect and reflection; and Miss B. Meyer's work, "The Stage Coach" (378), is interesting as a reminiscence of the old houses.

The East Gallery contains one powerful, sombre work—a solitary figure subject by W. Lee Hankey (481), "By a Path That I Do Not Know"—the figure of a young girl carrying her infant along a pathless waste at the side of a river at nightfall. The landscape is wrapped in gloom, a large red moon is rising above the horizon, the path lies through a tangled undergrowth of flowering thistles and rank weeds. There is considerable power and pathos in the treatment of the young mother, her way through the track of waste land, and the subdued darkness of the hour. The painter avoids all unnatural sentiment. The late John P. Gulich's picture of "An Art School" (427) is vigorously handled. A pretty nude model sits before a large assembly of students under a strong artificial light. The model is graceful in pose, the light and shadows dexterously painted, and the colour good.

In the centre of the long wall hangs Professor Hans von Bartel's picture, "A Fisherman's Wife" (543), an example of the Munich school, handled with much force, though somewhat harsh. The figure of the wife, seated amidst tufts of long grass, are realistically painted, and the colour is pleasing and natural. Several good landscapes and seascapes are hung. We must mention A. W. Weedon's "Waste Ground" (423); David Green's view, "The Port of Rye," clear, and full of light; Geo. Rushton's "Dreamers," children in a cornfield asleep; a large, soft landscape by B. J. Ottewill (468); studies by Thos. Pyne (458) and John White (467); Bernard Evan's two large and powerfully-painted landscapes, "The Wave-like Plain of France from Grasse to the Mediterranean," showing the vast, undulating valley of hills, and his fine rocks near Grasse (478, 487); the broad landscapes of E. M. Wimperis (540 and 549); and the clear, pearly hues in W. Lee Hankey's picture, "When Vernal Morning Breaks" (378), a stretch of lowland near a river. The solitary figure of a girl and the distant village are cleverly introduced, and the

treatment broad and pleasing. Other pictures are by Jas. Orrock, Robert Meyerheim; Miss Ethel Kirkpatrick's clever colour study of a girl picking poppies, and the large composition by W. W. Collins, "Boadicea Reviewing the Iceni" (533); Albert Kinsley, and Chas. J. Adams. Edward C. Clifford's "The Wizard's Daughter" (552) is a clever Medieval incident, and the figures of the graceful maiden turning to look at the old monk and his companion—a jester—are cleverly drawn. In this gallery the Society of Miniaturists have a large display of their works.

#### CERTAIN REFLECTIONS ON THE ENGLISH RENAISSANCE.\*

AS the subject of the English Renaissance, if historically treated, would be quite beyond the scope of a single lecture, I propose to call your attention to certain aspects of this chapter in history, and to endeavour by this means to disentangle some clue to guide us through the perplexities of modern architecture. Any conclusions I offer with great diffidence. The present condition of architecture is so unsatisfactory, and so beset with difficulties, both in theory and in practice, that the most one can hope to attain to is some firm foothold on the facts of history—a foothold from which we can start again with at least a glimmering of an idea of the goal at which we aim. For in architecture, the oldest of the arts, we can only consider ourselves on safe ground so long as we keep in touch with what has been. A comparison has been made between the Renaissance of the 16th and 17th centuries in England and that of the 19th (assuming, of course, that the latter exists). In order to test the worth of any such comparisons, it is necessary to consider for an instant what that great Renaissance was of which our own 16th and early 17th-century architecture was but a distant echo. There are

#### TWO POINTS ABOUT THIS MOVEMENT

which differentiate it from any others in the history of art. The architecture of the ancient world was one long, continuous progression from its dim beginnings in the East till its disappearance with the downfall of the Roman Empire. Architecture might flourish in one place more than another, but throughout its long history there was no break in its continuity. Its historical development went straight ahead, with no throw-back to earlier art, till its vitality dwindled, and it died out with the decaying forces of Roman civilisation. There was a curious objectivity about the ancient world which prevented any intense reflection of its life and thought on its visible art. That art was settled for it. It was accepted as part of the established order of the State, and so it ran its course without regret and without ambition. Now, the Renaissance was a conscious return to the art of the past, to the art, that is, of the Roman Empire. It was not a mere revival. It was a deliberate and successful attempt to enter into the spirit of the great Roman architects. What makes it the more remarkable, and indeed without parallel in history, is that there already existed another method of architecture in full and complete maturity, for Gothic architecture had reached the very limit of technical skill. Yet men were prepared to turn their back on this traditional art, they were learning to welcome the new method, to repudiate their familiar language, as no longer adequate to their needs. For the first time we strike the characteristic note of modern art, its intense subjectivity, its deliberate consciousness. This momentous change in architecture did not result from the craftsman's instinctive habit of refining on the past, but from a change in the direction of intelligence, from a certain revulsion in ideas, not from the action and reaction of craftsmanship. For

#### CHANGES IN ARCHITECTURE

come about in one or two ways. When a method (or style, to use a doubtful term) is fairly established as traditional, the actual manipulation of materials by workmen and the introduction of new materials lead to the extension and modification of the style itself, as, for instance, the growth of Perpendicular Gothic out of

Decorated. The development comes from within and proceeds more or less unconsciously. But there is another source of change in architecture. In the course of ages the seeds of change are slowly at work, till there results some great upheaval of ideas which dislodges mankind from its mental anchorage. The old idioms seem meaningless, the familiar formulae barren; and then comes that tentative effort after a new expression which will gradually expand and consolidate into a permanent art. A new factor will have taken its place in human intelligence, which has to be recognised, however much our sympathies may lie with the art it has replaced. Such a change occurred at the Renaissance. Since the fighting days of the dark ages civilisation has steadily advanced. Men were rich, intelligent, learned, and the keener and more active minds had long since shown impatience of mediæval standards and idioms. There was but one direction in which this enterprise could find its natural outlet, and this was scholarship. Latin was the familiar language; scholars naturally turned to the country of its birth, and so from the study of the literature of Rome they came to the study of its art, and that art was adopted with enthusiasm as the only fit expression of Humanism, that new motive in thought and morals which the Renaissance won back for mankind. In this regard Alberti is typical of the Earlier Renaissance; he can have found little to attract him in the professional side of architecture. His reward lay in his keen enjoyment of the art, in the occasion that it gave him for the exercise of his own fastidious scholarship. Thus the peculiarity of the art of the Renaissance is that it was much more than a mere change of technique. It was the result and the expression of a new order of ideas which had been slowly growing for generations until it became articulate in art; something altogether greater than the small ephemeral fashions which are all that the 19th century has to show by way of a Renaissance.

#### ENGLISH BUILDERS AND THE RENAISSANCE.

Now, how did the English builders regard this far-reaching movement? It is quite plain that in the first instance, and, indeed, for several generations, they did not in the least understand it. In the first place, they themselves were ingrained in the Gothic tradition, trained exclusively in its method of construction, and unfamiliar with any architecture but that of their own country—one might almost say of their own county. And, in the second place, they were introduced to this new art by travelled and scholarly amateurs. All the inspiration came from the court and the wealthier upper classes; and the English builder, probably somewhat against his will, had to set to work to master the strange new fashion. The only acquaintance with it, as amongst Englishmen, was possessed by amateurs, and the workmen at first had to follow their instructions with such help as they could get from the work actually executed by Italian craftsmen in this country, and it is to be borne in mind that, in actual fact, not many Italians were over here, and that the majority of them, with the exception of such men as Torregiano, Rovezzano, and the Majani, were quite inferior men. The results were the most ridiculous blunders in grammar, for the Englishmen endeavoured to make some rudimentary acquaintance with the orders by way of ornament, but planned and constructed their houses according to their own tradition. As the 16th century went on, and the first Italian influence disappeared, their workmanship fell off, but their knowledge of the orders grew. Students, such as John Shute, with some architectural training, were sent out by noble patrons to make systematic study of Italian architecture; and the German and Flemish workmen who succeeded the Italians brought with them an abundance of pattern-books, so that the business of decorating houses with fatuous ornament proceeded apace. Yet even in far-away England, the air, if one may say so, was instinct with its influence. The horizontality of Elizabethan architecture was itself a dim reflection of the great recovery of the Italian Renaissance; and the day was fast approaching when an Englishman of genius would see his way through all these troubled efforts, and grasp the principle, the basis of idea, that underlay this fundamental change in architecture.

#### THE BASIS OF THE RENAISSANCE.

Let us consider for a moment what that principle was. In spite of the researches of such men as

De Geymuller, our young students are apt to consider the architecture of the Italian Renaissance as an affair of detail. Their attention is arrested by its exquisite carving, its arabesques and other details, which form such a tempting subject for illustration. Yet all this detail might go, and the value of the work of the great Italian architects remain untouched. For the basis of their work, and it is this which gives it permanent value, lay in construction; their real accomplishment lay, not in ornament, but in their avoidance of it, and in their past-mastership of proportion and of the intellectual problems of architecture. They studied to some purpose the remains of the stupendous architecture of Rome. Not only did they extend, to a point as yet undreamt of since the days of the Empire, the use of domes and simple vaulting, but they recovered the use of the lintel in combination with the arch. They threw off the unreasonable intricacy of detail with which later Mediævalism had encumbered architecture, and brought back the art to its abstract basis in construction—that is to say, to the simplest and most direct methods of building, the lintel for crossing narrow spaces and the arch for wide ones (I speak, of course, without regard to steel and iron construction, at that time practically undreamt of), flat ceilings, domes, or the simplest forms of vaulting, for covering in their areas. The great recovery that the Italians made from the remains of Roman architecture was this use of the lintel, and the arch in construction, and the use of domes and simple vaulting. A dull man might have recovered its detail, but only the genius of Brunelleschi or Peruzzi could have disentangled these constructional ideas, simple as they seem to us now, and showed how they could be applied easily and naturally to every case, as an elastic method of construction, not merely as an exercise in scholastic canons of design. Given, then, a certain method of construction, in good architecture, the design in all its multifarious parts must follow it. To the arch the Renaissance added the lintel; and it is in the play upon these abstract motives that the real significance of Renaissance architecture lies.

#### THE WORK AND WORKS OF INIGO JONES.

Now, the first Englishman who really grasped this fact was Inigo Jones, and it is for this reason that his work is so profoundly interesting to us, and so completely differentiated from the work of his predecessors. At length there had appeared a man who understood architecture as the Italians understood it; who brushed on one side all the detail and ornament which had seemed to the Elizabethan and Jacobean designers the whole essence of the art, and had gone straight for the heart of the matter; realising that, after all, architecture is simple construction, ennobled and idealised by the working upon it of a powerful brain and highly-trained imagination, and that its strength lies in its own abstract qualities, fine proportion, bold distribution of masses, extreme reticence and simplicity of ornament. He saw (and few had seen it in England since the days of Early Gothic) that architecture is not ornament—that ornament, indeed, is only one—perhaps a subordinate one—of the many weapons which architecture has in her armoury. For the first time after a hundred years of blind experiment this country possessed an organic style. I need not dwell on the brilliant ability with which Inigo Jones used this style. His exact and fastidious refinement is familiar to all students. Perhaps we are not all so familiar with the masterful freedom of his designs. It has been customary to insist on the greater versatility of Wren as compared with Inigo Jones, and a writer in the *Times* once attempted to make some absurd distinction between Jones and Wren, treating Jones as an Italian, and Wren as the first English architect proper. The writer in the *Times* had the usual knowledge of amateur critics; but those who have studied the work of Inigo Jones and Wren know, in the first place, that Wren could never have started where he did if Inigo Jones had not preceded him; and, in the second place, that it is a mistake to identify the work of Inigo Jones with that pedantic version of Palladianism which the 18th-century architects set up as his particular manner. That Jones did adopt Palladio's architecture as the last word of the Italian Renaissance is, of course, undeniable. The point to be realised is that, whatever his imitators may have done, Inigo Jones himself worked with all the freedom of

\* A paper read before the Architectural Association on March 17, 1899, by REGINALD T. BLOMFIELD, M.A., F.R.I.B.A.

genius, a freedom founded on the most intimate mastery of the actual technique of his art. In this regard the distinction between Jones and Wren has been very much exaggerated, and Wren followed the lines laid down by Jones far more closely than has been generally supposed. The decadence began with the 18th century, with the men who succeeded Wren. Where Wren designed, these men copied, and they copied the least attractive features of Inigo Jones and Palladio. The pedantic conception of this man of genius which exists in the amateur mind is really derived from Kent's publications and eighteenth-century copies of his work. I do not propose to follow further

#### THE COURSE OF ENGLISH RENAISSANCE ARCHITECTURE.

The eighteenth-century architects allowed their art to be collared—if I may be permitted the phrase—first by amateurs and afterwards by men of letters. The strength of the old tradition kept them within some reasonable limit—at least, as late as the early part of this century. But that romantic element of literature, which had made its first incursion in the days of Horace Walpole, has encroached on architecture with disastrous rapidity and power in this century; so much so that, a generation back, it almost seemed as if the last trace of our fine traditional Classic would disappear under the preachments of men with no exact knowledge of architecture, who approached the subject from a standpoint entirely out of relation to the art itself. It would have been a curious result if that great development of architecture which owed its first origin to scholarship should have suffered its final extinction at the hands of the literary amateur. To put together the results of this very general survey, I would suggest the following

#### CONCLUSIONS AS THE TEACHING OF HISTORY;

(1) that the Italian Renaissance itself was the necessary result of far-reaching causes; (2) that our English Renaissance in its kind and degree was part of this movement, and is not therefore to be dismissed as a mere change of expression in architecture, but must be accepted as part of an inevitable development, precluding a return to the motives and ideas that lay at the back of Mediæval art; (3) that in the architecture the real work of the great Italian masters was to rediscover, almost to recreate, new methods of construction and proportion; (4) that the fact was not realised by the Elizabethan builders, who could not see the wood for the trees, and that actually it took about 100 years of experiment to produce the man who could see beyond this detail, and establish order and logic in the tangled maze of English architecture; (5) lastly, and as a corollary to this, that the mere fact of his having done so, and the circumstances of the case, have brought about a permanent change in the work and position of the modern architect, to which I will call your attention later. Now,

#### HOW DO WE STAND

at this moment in regard to the theory of architecture? I do not mean abstract theory as to its philosophical basis, but our own attitude to the art. What are the sources to which we look for inspiration? What are the ideals at which we aim in actual design? I fear that the answer to this question can hardly be satisfactory. We are, here at the end of the 19th century, in a condition of greater uncertainty, and more complete absence of conviction than, I should say, at any previous period of history. You have merely to look back upon the last 100 years. We began the century with the remains of the Classical tradition, but Adam had already "improved" it, as he thought; Stuart and Revett had done their work, and the Greek fashion was well in the ascendant. Then came Pugin, ardent, fanatical, full of energy and narrow ideas, a very iconoclast in regard to the old tradition; and after him Ruskin, who thought he had found the key to architecture in his personal preferences and the morality of Exeter Hall. Then came the rush for Gothic, Early English, Early French, Early Italian, with a vehemence that threatened to sweep the board clear of everything but a heterogeneous collection of details from every country. Every man has been for himself, and meantime architecture has gone to the wall. The serious study of architecture, not only as an art, but also as an expression of the intelligence which is not arbitrary, but determined by certain inevitable causes, has almost dropped out of sight, and I suppose that, in

practice, the very worst work that has ever been done in England has been done in the last fifty years. I need hardly add that a few men of powerful and original mind have done admirable work, but the average of architecture has been left untouched, and it is by the average level that the state of architecture has to be gauged. We cannot look back with pride on the artistic attainments of the 19th century, judged from any standpoint, and it appears likely that we shall enter on the 20th century without having hit upon any certain way through this quagmire of modern architecture. It is here that

#### THE STUDY OF THE PAST

must help us. The days of the craftsman working independently, yet in unconscious unison, ceased when the choice of styles arose. He tasted of the tree of knowledge, and henceforth to his knowledge of his craft had to be added the responsibility of conscious judgment, if he was to undertake, I will not say architecture, as it might be thought to beg the question, but building of any sort. Because, in any building nowadays, a man has to use one method of expression in preference to another, and implicitly in this there is raised the whole question of selection. Now, this responsibility proved too much for the simple craftsman, as you may see from the blunders in design which abound in more ambitious Jacobean works; and it was only a question of time how soon there should arise the man who had sufficient training and intellectual capacity to enable him to discriminate between good and bad, to enable him to grasp the logical coherence in expression which is an essential element of architecture. As soon as such a man arose, the matter was settled for good or bad. The architect ceased to be a craftsman in the technical sense, and what might be lost in craftsmanship was assuredly gained in architecture. I think, therefore, that this critical function of an architect, this detachment from the actual details of craftsmanship, which chafes the enthusiasm of some of by no means the least gifted of our younger men, is of the very essence of his work. The more of craftsmanship he has the better; but a man may be a very good architect without being a very good craftsman—I mean a good craftsman in the sense of being able to carve his own woodwork and model his own ceilings. His craftsmanship must be of a wider range. It must embrace full knowledge of the past; it must rest on a constant habit of analysis of the best methods of expression in building, and a keenly critical insight into the abstract qualities of architecture, mass, balance, rhythm, and proportion. An architect, to my mind, should be like a fastidious man of letters, he should not be content to express his purpose anyhow, he should be anxious to find the exact inevitable phrase. It is in this sense, I think, that an architect should be an artist of the highest order, and this is the position that has, in fact, been forced upon him since the days of the Renaissance. Perhaps this reflection may be some consolation to those who would reluctantly abandon the idea that in craftsmanship lies the future of architecture. Nor, again, is this ideal less exacting than the other. To attain to this faculty of reasonable judgment it is clear that a man must possess knowledge of what has actually been done in architecture—the more the better, provided he is not over-burdened by it; and this knowledge is not mere student's learning, but means a practical knowledge of buildings, gained by careful analysis and measurements, and by exact observations of materials and local circumstance. A lifetime of constant study is not too much for such a task. I would suggest to you, therefore, to those of you, that is, who are now beginning your career, that there is

#### NO SHORT CUT TO ARCHITECTURE

through pattern-books, or even through the pleasant paths of detail craftsmanship; but that, nowadays at any rate, you must have knowledge, and that now, as always in the history of architecture, you must seek that knowledge not only in books, but also in the builder's yard and on the scaffolding of buildings. I have still one more point to bring before you. Perhaps in this paper I may seem to you to have insisted too much on knowledge, too little on imagination, and the criticism has been made on some remarks of mine elsewhere. In the first place, I would point out that we seem to be face to face with

SOME DANGEROUS DEVELOPMENTS OF ORIGINALITY, or, rather, eccentricity. To judge by the majority of our buildings, it appears to be thought

that "knowledge hampers imagination," as it was put by the eminent Capability Brown. Certainly, the results are a very nightmare of architecture. Now, there is only one antidote to this sort of originality, and it is knowledge. I fancy that some of the more accomplished of our original designers would be rather surprised to find that the flattest of their ogees, the boldest of their amazing proportions, have been anticipated, not only in Italy, but even in England. Even a cursory knowledge of the work of such a man as Baldassare Peruzzi would show them that profound knowledge is not incompatible with the most complete freedom in design; and further, that the most daring imagination can co-exist with the most trivial detail. You may recollect the indignation of the old Sieur de Chambray at the pretensions of the men of his time, who thought that by turning a capital upside down, or something of the sort, they had invented a new architecture, "as if the Pantheon" (I quote the Sieur de Chambray) "that same stupendous and incomparable structure, were not the invention of the architect who built it, because he has vary'd nothing from the Corinthian ordnance, of which it is entirely composed." In the second place, and this is the gist of all that I have said, this

#### KNOWLEDGE IS NOT AN END, BUT A MEANS.

For an architect does not study in order to reproduce what other men have said once and for all, but to perfect his own mastery of expression; and just as a poet does not invent a jargon of his own or write in the language of Chaucer, but takes the current language of his time, and compels it to his purpose, so an architect would not waste his time in a vain ambition of a new style, or a futile copy of an old one; but would master the best in all the architecture of his country, and find thereby an ample language for his own individuality. It is, not styles, therefore, that we are concerned with, but style, that indefinite quality of all good architecture, whether Greek or Roman, Gothic or Renaissance; undefinable, and ever varying, because it varies with the individuality of the artist, because it depends on the faculty that the man possesses of giving the simplest and yet the most complete expression of all his purpose. It is here that knowledge must come in, as the groundwork of good architecture. We want to know, as part of our training in our art, how other men in the past have solved the difficulties that confront us now; and it is only by this long laborious study that we can learn to discriminate between good and bad, and to free our own method of expression from what is trivial and irrelevant. It is this way, and not along the pleasant paths of the amateur, there lies the best chance of the architecture of the future.

#### THE ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Architectural Association was held at 9, Conduit-street, W., on Friday evening, the President, Mr. G. H. Fellowes Pryne, F.R.I.B.A., in the chair.

Mr. G. B. CARVILL, hon. sec., proposed a vote of thanks to Col. R. W. Edis, F.S.A., for conducting members over the Hotel Great Central, Marylebone, on the 11th inst., and to Mr. E. Wragge for acting as guide on the same afternoon during the visit to the adjoining railway terminus. Mr. Carvill added that the next spring visit would take place on the 25th inst. (tomorrow) to the fire-testing station of the British Fire Prevention Committee at North Bank, Regent's Park, at 3 p.m.

#### THE NEW COMMON ROOM.

The President said he had great pleasure in announcing that the new Common Room would be formally opened on the following Monday evening. It would be found to be a very great improvement on present conditions, and an important step in the direction of securing new premises. Mr. E. HOWLEY SM added that the President had laid the corner stone of the Common Room by presenting a clock.

The President mentioned that on Wednesday, the 22nd inst., the class of Quantity Surveying conducted by Mr. H. J. Leaning would commence, and that on April 12 that of Land Surveying, under Professor Henry Adams, would be opened. He also announced that the annual soirée would take place at St. George's Hall, W., on the evening of Friday, April 21, when a play of exceptional interest, written by their

hon. secretary, Mr. Carvill, would be performed; the ladies' night would be two days earlier, on the 19th prox.

#### CERTAIN REFLECTIONS ON THE ENGLISH RENAISSANCE.

Mr. REGINALD T. BLUMFIELD read a paper on this subject, reported on p. 399, and illustrated by some admirable drawings of old work from the lecturer's pen and pencil.

In inviting discussion, the PRESIDENT remarked that Mr. Blomfield had made the subject of the English Renaissance his own, and they were to some extent familiar with his views and conclusions as set forth in his valuable book. He agreed with the lecturer that an all-round knowledge of what had been done in architecture should be the keynote of an architect's training as opposed to the cramped idea now prevalent in some quarters that he should apply himself to mere craftsmanship. There were many points in the paper open to discussion, and it was one well worthy of careful consideration and study.

Mr. LEONARD STOKES, past president, said he came to that meeting as a mere Gothic architect to learn of Mr. Blomfield, but he found himself in entire agreement with the lecturer, and only able to say ditto, ditto, especially to some things. There was a certain class of architects who thought that without knowledge of past work they could do everything; if they knew a little more, they would do a little less, and would do that little a great deal better. Mr. Blomfield had ably put before them the truth, that craftsmanship was not everything to an architect, but that he needed to have a general knowledge of the details of the crafts, and a thorough grasp of the principles underlying the work. There were many men outside that room, of course, who thought that if they knew a few details, and were able to introduce them bodily into the works, they need not trouble about general principles; but a deeper study of past work would save them from committing many mistakes. He proposed a vote of thanks to the lecturer.

Mr. L. A. SHUFFREY, in seconding the motion, remarked that the advice given was clearly put, and was most necessary at this juncture.

Mr. A. T. BOLTON, in supporting the vote of thanks, expressed a hope that the paper would reach some of the men who had got on the wrong track, and were regarding craftsmanship as the chief aim of the accomplished architect. A case in illustration of the value of design, apart from the actual craftsmanship, was St. Paul's Church, Covent-garden, which had suffered much from fires and restoration, and yet impressed the visitor with the genius of Inigo Jones as displayed in its design and planning. So did the Banqueting Hall at Whitehall, also by Inigo Jones, although much pulled about by Sir John Soane. Again, recent investigations had shown that the Propylæa at Athens was finished and polished down by slave labour. Surely at the present day mere craftsmanship ought not to be exalted at the expense of design. Machinery was not necessarily fatal to good design, and consequently to architecture. He disagreed with the lecturer on one point; the Anglo-Classic School did very little for the ordinary small dwelling-house, nor were the churches of Inigo Jones and Wren suitable for modern uses. The great development in the smaller English house was due to Mr. Norman Shaw, and other men of the present day had evolved the inexpensive modern church. He did not think the progressive character of the English Renaissance had been sufficiently emphasised by the lecturer.

Mr. A. H. HART thought Mr. Blomfield had done young architects good service in insisting upon the importance of studying old work broadly from buildings themselves, and not merely from books, and in pointing out the folly of attempting to design by merely annexing little bits that attracted the eye.

Mr. ROWELL also endorsed the lecturer's view so clearly expressed that detail is not architecture, but that a knowledge of general principles is essential to the architect.

Mr. C. H. BRODIE thought it curious and, indeed, extraordinary that such a paper should be read that evening in the Metropolis where its cathedral, acknowledged to be Wren's masterpiece, was being spoiled by mere craftsmanship; it was indeed strange that Londoners were allowing an artist, however eminent and clever, to alter the architectural effect of this building without protest. Then, with reference to the Vauxhall Bridge, where was the architect, and

what was his name? The authorities had shown themselves unwilling to hear the protests of architects against the proposed work.

Mr. TEMPLE MOORE thought they wanted to drive a knowledge of broad principles not so much into architects, but into the heads of the general public, who paid for the work. At St. Paul's Cathedral, those who did know what was right and wrong had no weight in preventing the making of mistakes.

Mr. MATT GARbutt said he had been rather amused at the remarks on general principles enunciated in the discussion. He had had the greatest difficulty in finding even a hint in the lecture as to principles. They had heard some criticism on the work in progress at St. Paul's, but he feared there were very few architects who had had sufficient training in colour possibilities to put even passable colours on to internal walls. He wished some one would arise who would produce a sixpenny handbook showing what the true principles of architecture were, for he had never heard them formulated. There had been a great deal of slanging with reference to Vauxhall Bridge, but he had not yet seen so much as a sketch of what architects agreed should be done, put in competition with the published design. The engineer did not pretend to evolve an artistic structure, but had merely designed something that would stand and carry the estimated weights to pass over it.

In summing up the discussion, the PRESIDENT observed that he did not disagree with a single point advanced by the lecturer. He had expected to hear some objections raised to Mr. Blomfield's strictures on the hopeless state of present-day architecture; but no one had taken up the gauntlet nor pointed to a gleam of hope. Brunelleschi brought order out of chaos at the beginning of the Renaissance by going back to the fountain-head of architecture—Greek and Roman work—and certainly with great success. He for one hoped that the work now in progress at St. Paul's would be stopped. Among the general public there was a curious unanimity as to the waste of money and labour in executing work which could not be properly seen, and certainly it was but little in sympathy with the architecture of the building. Two observations in the paper deserved to be remembered by all architects—viz., that you must seek a knowledge of architecture not only in books, but in the builder's yard and on scaffoldings, and that not styles, but style was the indefinite quality of all good architecture.

In acknowledging the vote of thanks, which was carried by acclamation, Mr. BLUMFIELD said he agreed with Mr. Stokes that the primary craft of an architect was to control and direct all building operations, and it was the work of a lifetime to acquire this craftsmanship. Mr. Brodie had raised some large issues; the best way to check mistakes in work would be for architects to put their own house in order, and to get some general consensus of opinion quite independently of the particular phase of the individual work criticised. As Mr. Garbutt had said, it was rubbish to talk of general principles; architects should face the problem of a building as a whole, and details would fall into their proper relationships. No general set of rules for building could be formulated; each problem had its own guiding principles. He agreed in the main with Mr. Bolton. There was much 18th-century work in England, such as Groombridge, which was comparatively small in scale but good in character, and many of the buildings which looked so hopelessly dull, as portrayed in the "Vitruvius Britannica," were in reality very fair work. His own idea was that modern churches should be designed on much larger lines than 18th-century examples; but if they divested their minds of the trumpery details of these buildings, they would see much to admire in the planning and fine proportions. A fine architectural effect could be obtained quite apart from the conditions of craftsmanship. As for originality, that was a gift of God, and not within the reach of every student of architecture.

The dedication of the vicarage of All Saints with All Hallows, Euston-road, Bristol, took place recently, the Bishop performing the ceremony. The building, which is adjacent to the church, is a house of twelve rooms, constructed of Winterbourne stone with Bath stone dressings. It has been erected at a cost of £2,500, the site accounting for an additional £630. The house was designed by Messrs. Crisp and Oatley, and the builders were Messrs. Walters and Son, all of Bristol.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary meeting of the Institute was held on Monday evening, the president, Professor George Aitchison, R.A., in the chair. The hon. secretary, Mr. W. Emerson, announced the deaths of two associates—Mr. Frederick Mew, of 9, Gordon-street, W.C., elected in 1859, and Mr. William Reddall, of 10, South-street, Finsbury, E.C., elected in 1874.

#### NORMAN VAULTING IN ENGLAND.

A paper on the "Beginnings of Gothic Architecture," illustrated by over sixty lantern-slides, was read by Mr. JOHN BILSON, F.S.A., F.R.I.B.A. In some preliminary remarks the author alluded to the recent investigations of M.M. E. Lefèvre-Pontalis, Louis Gonse, Anthyme Saint-Paul, E. Enlart, and Herr G. Dehio into the origin and development of Gothic architecture, particularly in reference to Burgundy and the Ile de France, which had shown many of the propositions laid down by the late Viollet-le-Duc to be untenable in the light of more recent inquiry. Passing then on to his more immediate topic, Mr. Bilson rapidly sketched the development of Norman Romanesque resulting from the revival of architecture in Normandy early in the 11th century, and noted some of its most striking characteristics. Available literary evidence tends to show that some of the Norman methods were already in use in England before the Conquest; but we are not justified in believing that the design of these English buildings was marked by the logical precision so characteristic of Norman work, or that the English had taken any step in the direction of vaulting over their churches.

#### THE VAULTING OF CRYPTS AND SIDE AISLES.

In studying the development of vaulting, as illustrated by English examples between the Norman Conquest and the middle of the 12th century, the author dealt first with the vaults of the lower parts of churches, such as aisles and crypts, citing existing examples of the various forms described. The groined vault in its simplest form results from the intersection of two semi-cylindrical vaults at right angles to one another—a survival, in fact, of the Roman groined vault. Generally, however, these groined vaults are banded by semicircular transverse arches or "doubleaux," usually of simple square section, and forming a kind of permanent centring. The adoption of these doubleaux, however, involved considerable inconvenience in the construction of the springing of the groin. In the Roman groined vault and its imitations the groin springs from the external angle of the pier or pilaster. In many of the Early Norman vaults the groin springs either from the internal angle formed by the junction of the transverse arch at its springing with the wall-face, or from the face of the wall or arch close to the angle. As the vaults were constructed of rubble masonry with thick joints, and covered with plaster, this method of springing the groin was obviously defective as a matter of construction. Consequently we find the difficulty met at a very early date by a further development in the membering of the supporting pier; the pilaster which carries the transverse arch is flanked on each side by a secondary pilaster, which affords an independent support for the groin. In some crypts, where the vaulting is supported by single cylindrical shafts, the springing of the vault is subdivided in a similar manner, so as to give a separate projection for the springing of the groin. A further advance consisted in the substitution of a shaft for the square pilaster which supported the groin. At Saint Etienne, Caen, and at Winchester Cathedral an improvement is found in the construction of certain of the vaults—the haunches of the vault, for a short distance above the springing, are constructed of ashlar, above which the vault is of rubble plastered. Having described the modification the simple groined vault underwent when necessitated by the oblong or irregular plan of the bays to be vaulted, the author passed to his main subject—

#### THE RIBBED VAULT.

Wherever it originated, or whatever the circumstances under which it was evolved, the advantage gained by the introduction of the rib was obvious. It afforded a permanent centring for the groin, the weakness of which in vaults over wide spans must always have rendered them liable to failure. It completed the membering of the vault, which

had commenced when the transverse arch was added to the Roman groined vault. The new expedient was readily adopted and rapidly developed by the Normans in England as well as in Normandy.

#### THE VAULTING CRUX IN DURHAM CHOIR.

The cathedral church of Durham is, the lecturer claimed, the most complete early example of the adoption of the ribbed vault in England. Contemporary chronicles record that every part of the church was covered with ribbed vaulting between 1093 and 1133. The plan of the choir and east side of the transepts shows that it was the intention from the first to cover both the aisles and the main spans with the vaults which were actually constructed. The aisle vaults of choir and transepts (the various features of which were described in detail by the author), constructed under Bishop William between 1093 and 1096, are clearly part of the original work; masonry and mouldings correspond in character with those of the choir arcades, and for constructional reasons the aisle vaults must as usual have been erected along with the main walls. The vaults of the nave aisles, the characteristics of which were next discussed, are the work of Bishop Ralph Flambard (1099-1128), and, as he completed the nave as far as the high vault, the aisle-vaults may safely be attributed to the first decade of the 12th century. They correspond in character with the aisle-vaults of choir and transepts, except in a few minor points.

#### WINCHESTER.

The next dated example of ribbed vaulting is to be found in the reconstructed parts of the transepts of Winchester Cathedral. The original work in these transepts belongs to the church which Bishop Walkelin commenced in 1079, and which the monks entered in 1093. The works of reconstruction necessitated by the fall of the central tower in 1107 are easily distinguishable from the original work by the different thickness of the masonry joints. The date of these ribbed vaults may be put within two or three years after the tower fell.

#### THE VAULTS AT PETERBOROUGH.

Peterborough Cathedral presents examples of ribbed vaults, the date of which is proved by documentary evidence. The earlier church was destroyed by fire in 1116, and the present building was commenced in 1117 or 1118. In 1140 or 1143 the monks entered the new church. The parts then completed include the choir and east side of the transepts (except, perhaps, the clerestories). The aisles of choir and transepts throughout are covered with ribbed vaults, the distinctive features of which the author described. The paper then went on to discuss M. Félix de Verneilh's conclusion with regard to the Peterborough vaults, on which M. Lefèvre-Pontalis based his statement that the ribs were added afterwards in the second half of the 12th century. M. de Verneilh's theory was that the supporting shafts were designed to receive the projecting groins of un-ribbed vaults, and that the actual ribs were added afterwards. In the recent taking down and rebuilding of the central tower, however, no evidence whatever was found to support this theory. It is clear that these Peterborough vaults are original from the fact that they do not stand alone, but are analogous in their method and construction to a large number of vaults which cannot all be the result of such an alteration as M. de Verneilh suggested. The author then passed to the consideration of examples of similar ribbed vaults to which, in default of documentary evidence, approximate dates only can be assigned from the character of the work. The following examples were discussed:—The vaulting over the north aisle of the nave of Gloucester Cathedral, which may be safely assigned to the first twenty years of the 12th century; Avening Church, Gloucestershire, ribbed vaults, c. 1120-1130; Southwell Minster, the aisles of the nave of which are covered with ribbed vaults, c. 1120; the Priory Church of Lindisfarne, built by Edward (who died probably near the end of Ralph Flambard's episcopate, 1128)—this church throughout was covered with ribbed vaults, and its design is evidently inspired by Durham; the nave of the abbey church of Dunfermline, also inspired by Durham, probably erected soon after the accession of David I. (1124); Selby Abbey church, whose eastern bays of the nave also afford marked indications of Durham influence; Romsey Abbey church, vaults of choir aisles; and the church at Lessay, Normandy—examples

interesting as showing how the idea of the ribbed vault was introduced, during the course of construction, in works originally planned only for unribbed vaults; the two churches at Devizes, Wiltshire, affording examples of aisleless chancels covered with ribbed vaults, and to be attributed with some probability to the architectural influence of Bishop Roger, of Salisbury, and dated approximately c. 1125-1130, St. John's being slightly earlier than St. Mary's.

#### VAULTING DIFFICULTIES.

The difficulties which confronted the builders of these early ribbed vaults, so long as they employed only semicircular or semi-elliptical curves for the ribs, were entirely surmounted by the adoption of the pointed arch for the doubleaux. The nave aisles of Malmesbury Abbey Church have been frequently quoted as the earliest example in England of this new method of construction, and have been attributed to Bishop Roger, of Salisbury; it is scarcely probable, however, that the rebuilding of the church was commenced before the bishop's death in 1139; it must, nevertheless, have closely followed that event, and the existing nave cannot be assigned to a later date than the middle of the 12th century. There is no evidence whatever to support Mr. C. H. Moore's assertion that the vaulting is an imitation of French work. The style of Malmesbury is purely Anglo-Norman, and shows no trace of the influence of such French work as the chapel of Bellefontaine and St. Denis. At the same time, the Malmesbury aisle vaults bring us to the threshold of the complete Gothic vaulting system, and almost to the time when French influence undoubtedly began to affect English work. In treating of the

#### VAULTS OVER THE PRINCIPAL SPANS

of churches, the author said that the Normans aimed at covering all parts with stone vaults. The plans of piers sufficiently indicate that the vaulting of the principal spans was intended to follow the vaulting of the aisles. The choir-piers of St. Nicholas, Caen, and St. Georges de Boscherville were cited as typical examples. Each shows a group of three shafts on each side of the pier to carry the arch-orders of the main arcades, a single shaft which receives the transverse arch of the unribbed aisle vault, and a corresponding shaft towards the main span. It is not improbable that the failure which naturally attended the construction of the earliest vaults over wide spans may in some cases have rendered subsequent reconstruction a necessity. Very few early examples of vaults over wide spans have survived. The earliest instance in England of a ribbed vault over the principal span of a great church is the choir vault of Durham Cathedral, though here the original vault was replaced by the existing vault in the 13th century. The vault over the north transept of Durham is probably the earliest of such vaults still existing. The evidence of the structure itself, the analogy of the other vaults of the church, and the documentary evidence, taken together, enable one to speak with some approach to certainty of the character and date of the original choir-vault of Durham. The plan of the choir, consisting of two double bays, is a type usually associated with a sexpartite vault. But the date is much too early for this kind of vaulting. There can be no doubt that the original choir-vault was a ribbed vault, and it may safely be concluded that the choir was originally covered with a double quadripartite vault over each double bay, closely resembling the vault of the north transept, erected almost immediately afterwards.

#### THE WESTERN VAULTS AT DURHAM.

The vaults of transepts and nave at Durham next came under examination, and were discussed at length, the author showing that the character of the work indicated that the vaulting idea was present in the earlier parts of the structure, and that it was abandoned and again taken up while the work was still in progress. Touching the date of the nave-vault of Durham, there is absolutely no authority for Billings's statement, repeated by later writers, that it was constructed between 1233 and 1244, in the Norman style. Symeon's continuator proves that the nave was vaulted between 1128 and 1133, and this is borne out by the character of the masonry of the vault itself. Durham affords complete proof of the ability of Norman builders to construct ribbed vaults over the principal spans of a great church, and to abut the thrust of these vaults by arches across the triforium, of

which the flying buttress is merely a development. Evidences quoted by the author indicate that the choir-vault was constructed by 1104; the vault of the north transept may be assigned to a date within the first decade of the 12th century, and that of the south transept within the first quarter of the century; while the nave-vault, with its pointed transverse arches, was constructed between 1128 and 1133. Examples of vaults showing the influence of Durham were cited in the priory church of Lindisfarne, no part of which appears to be later than the middle of the 12th century, and, on a small scale, Warkworth Church, Northumberland. The nave of Lincoln was vaulted before the middle of the 12th century. It was built by Remigius, and dedicated in 1092, was injured by fire in 1141, and Giraldus Cambrensis states that it was vaulted by Bishop Alexander. Henry of Huntingdon places the date of this work at 1146. What this vault was like may be gathered from the chancel of Stow Church, Lincolnshire, the detail of which so closely resembles Alexander's work at Lincoln as to prove that it was executed by the same school of masons. The evidence here indicates that Alexander's nave-vault at Lincoln must have been ribbed.

#### EARLY EXAMPLES OF RIBBED VAULTS TO APSES

were referred to, and their characteristics described:—The small apsidal chapel on the east side of the south transept of Christ Church, Hants, appearing to date from early in the 12th century; the apsidal chapel on the east side of the south transept of Tewkesbury Abbey Church, which may be assigned to the first twenty years of the 12th century; Birkin Church, Yorkshire, middle of 12th century; the octopartite vault of the Treasury of Canterbury Cathedral; the apse-vault of the chapter-house of Durham Cathedral, a larger and more advanced example, finished by Bishop Geoffrey Rufus, 1113-1140. The last named was partly destroyed by fire in 1796; but Carter's drawings have preserved an accurate record of it.

#### ENGLISH VAULTING NOT DERIVED FROM THE ÎLE DE FRANCE.

The author concluded his paper with some observations on the bearing of the English evidence on the general question. Before the introduction of the rib, the Normans were already developing the articulation of their construction to an extent quite unknown in the Île de France. The earliest ribbed vaults exhibit a system which is slightly less advanced than even the primitive vaults over the aisles of St. Etienne, Beauvais. The large number of ribbed vaults still remaining proves the existence of an active school, which had already accomplished much before the introduction of the pointed arch. It is remarkable that all these English vaults are quadripartite. No example is met with either of the sexpartite vault or of the intermediate form—quadripartite cut by a secondary transverse rib—both of which occur in the group of churches in and around Caen. Obviously the quadripartite vault was the earliest form, and varieties could not have been developed if the quadripartite vault had not previously been known. The evidence of the rib sections points in the same direction. As in their system so also in the profiles of the rib mouldings, the earlier ribbed vaults in England come into line with the quadripartite vaults at Lessay, and represent an earlier stage than the vaults of the Caen group. These latter, whether sexpartite or of the intermediate form, show one easily-recognised type of rib section, a more refined and clearly later type not found in England until the octopartite vault over the treasury at Canterbury Cathedral, probably erected soon after 1130. The approximate date of 1130 suggested for the earliest vaults of the Caen group seems probable enough, and the experiments which the builders of these vaults tried in setting out the curves of the ribs indicate that they were not adopting ready-made a system already worked out elsewhere. Apart from the English evidence, the authenticated dates of the earliest ribbed vaults prove that influence from the Île de France is quite impossible, and show the complete independence of the Norman school up to, at any rate, the end of the first third of the 12th century.

Mr. R. PHENE SPIERS, F.S.A., in proposing a vote of thanks to the lecturer, expressed regret that Mr. Bilson had not more fully dealt with the sequence of the early vaulted churches in

Normandy. The author had sought to prove that English Norman vaulted buildings were not necessarily copied or imitated from those in the North of France, but were, in fact, developed earlier. The revival of architecture all through Europe commenced early in the 11th century, and, as a matter of fact, the builders of Normandy lagged behind those of other parts of France. The earliest church in Normandy—that of Kerqueville—was not older than the beginning of the 10th century, and there was no other contemporary example in Normandy. At the church at Bernay, both the triforium and clerestory were of about the year 1030, and the character of the carving and vaults was later, perhaps about 1050, and both Mr. Bilson and himself had independently arrived at the conclusion that they were of Burgundian origin. Not until they came to the period of the Norman invasion of English did they find a rapid advance in architecture; and even then the Normans were soldiers rather than builders; for example, in Sicily they employed local labour in construction, and consequently the works in that island were of a Saracenic character. In Normandy itself, they sent into Burgundy or to Cluny for skilled people to carry out their carving and building. Then they came to the question of the churches in Caen. The late Mr. J. H. Parker made in 1863 a most minute examination of the two great churches in that city, and concluded that they were probably not vaulted before 1150, or from 20 to 40 years later than the date assigned to the Durham vaults by Mr. Bilson.

Mr. FRANCIS BOND, M.A., said the paper represented an enormous amount of care and labour on the part of Mr. Bilson, and it seemed unfair to criticise such a lecture without reading and weighing the evidence carefully. If the author was right in his argument, then they had in the builder of the choir-vault of Durham Cathedral the greatest and foremost architect in Western Europe, and he for one would be very glad to be able to accept that view if sufficient confirmatory evidence were forthcoming. The difficulty of interpreting documentary evidence in all cases of the data of particular parts of a building was to ascertain what was actually in the mind of the early chronicler. The building operations described by him were one, and the ones understood by Mr. Hodges and Canon Greenwell were quite another. It turned upon the correct translation of the term *testudo* as applied to vaulting; this often designated a wooden roof as well as a stone vault, by which we understood it, and, indeed, in some cases, he qualified it by stating it was *testudo lithis*—i.e., a stone covering. They were quite at liberty to assume that a wooden roof was placed upon the choir of Durham in 1128; but it was very difficult to believe that it was roofed with stone so early as 1104. If one looked back at contemporary vaults thrown high up in the air over a vault with aisles, and pierced by clerestories, they found them divided into oblong compartments, over which the builders boggled, and they generally shirked the problem of introducing a clerestory. He questioned very much whether a single vault so early in date could be found. Work known to have been done at St. Ambrose, Milan, in 1050, was much simpler, more archaic, and without mouldings, and, which was still more to the point, the clerestory was omitted, the aisles being raised to two stories in height, and the main roof correspondingly depressed. The vaults of Cluniac churches were a little later, and in these there was a clerestory, but only a barrel vault over the main span. The Cluniac church at Vézelay had an intersecting vault, but it was only groined, and not ribbed like that at Durham; it was erected in 1120—i.e., some sixteen years later than the date claimed for Durham, while it was far less advanced in character. There were very important examples all less advanced than Durham, and if Mr. Bilson was right in dating its choir-vault 1104, then it was obviously the first solution of the problem of constructing a ribbed vault with a clerestory. If so, would not one imagine that the fame of such a constructional triumph would spread far and wide, and they ought to find many slightly later buildings. It was time that Lindisfarne and Warkworth church appeared to have been altered in like manner; but the period was not clear, and both were appendages and neighbours of Durham, and the treatment in each must have been very simple. As for the vault of Lincoln, the Norman

nave had hopelessly gone, and one could not judge of its form. The chancel of Kirkstall Abbey was still in existence, dated 1159 or 1160—a very long while after 1104—and even there the work was very simple in character, and they must go to the choir of Canterbury Cathedral, built in 1180, or to Boxgrove church or the presbytery of Chichester Cathedral, both works of the last few years of the 12th century, to find similar vaulting to that they had been shown at Durham, to which work they had, therefore, nothing leading up, and at the date sought to be assigned to that work it should be recollected Norman architecture had only been introduced into England during less than 40 years. He believed the vault was of the period of Bishop Pudsey. He wished to second the vote of thanks to Mr. Bilson.

Mr. W. H. ST. JOHN HOPE, F.S.A., wished to draw attention to the parallel cathedral church at Norwich, which was building about the same time, and, although the nave was not vaulted till the 15th century, the choir very possibly had an earlier vault. Norwich was, as they knew, built by Herbert de Losinga between 1096 and 1119. Beginning at the east end, that bishop had carried the work at the time of his death in the last-named year as far as the altar of the Holy Cross, or down to the present choir screen—i.e., to the fourth or fifth bay westward of the nave. This work included the eastern arm and Lady Chapel, the crossing, transepts, and eastern portion of nave. The work was carried on by his successor, Bishop Everard, 1121-41, who was said to have finished the main buildings. The architectural evidence of the cathedral was perfectly clear that it was intended to be vaulted from end to end. The aisles are perfectly plain; they have wall ribs, not paralleled at Durham, and are vaulted throughout. Norwich, like Durham, is divided into double bays—fourteen in the nave alone. The principal piers in the nave are enormous shafts running to triforium level, and then ending with broad capitals. It was evident that these were to carry transverse ribs. The nook shafts also carry ribs, and were plainer in treatment than those at Durham. Unfortunately, a series of disastrous fires prevented the execution of the original vaulting of the nave or transepts, for which latter parts similar preparations for vaulting were made. This evidence is also emphasised by indications of abutments in the triforium, showing that it was intended to throw a half arch over the aisle. The responds to carry flying buttresses remain to this day on the south side. In the history of vaulting, he thought Norwich Cathedral ought to be taken into consideration.

Mr. E. W. HUDSON thought there was a danger of neglecting some examples of Norman vaulting close at hand in the Confessor's work at Westminster, the barrel vault in the White Tower, and the later work at St. Bartholomew the Great, Smithfield. The crypt of the priory of St. John of Jerusalem was an excellent example of ribbed vaulting, similar to the early work at Gloucester Cathedral.

Mr. BILSON, in reply, said M. Phené Spiers had quite misunderstood his references to the contemporary Norman work in Normandy and the Ile de France, which was quite independent of and later than that in this country. It would take an evening properly to reply to Mr. Bond, but he thought that speaker had very much overrated the extent of the problem solved at Durham. It had been solved before at St. Nicolas, Caen, in 1080. He quite admitted the difficulties in crediting the reading he gave, and had only gradually come round to those views after Canon Greenwell had shown him the vaulting, and Professor Baldwin Brown was also sceptical at first. He was obliged to Mr. St. John Hope for calling attention to Norwich, and he believed that when examined it would substantiate his case. He felt that we were only at the beginning of knowledge as to the development of Gothic architecture, and hoped yet to learn a good deal more.

#### INTERNATIONAL EXHIBITIONS: A RETROSPECT.

THE Great Exhibition of 1851—how many readers of these lines have a clear remembrance of this wonderful, and then altogether novel, collection of the world's wonders? In all probability not many. Forty-eight years is a long period in the allotted span of life. Sad ravages are made in the list of one's friends and acquaintances in even half that time! As a boy of some nine summers, I well recollect the great

glass-house rising up from off the green sward in Hyde Park, and wonder, almost amounting to juvenile awe, pervaded the minds of we boys when a huge tree that grew in the midst of the site, instead of being hewn down as a matter of course, was left where it stood, and literally spanned over by the crystal roof. Of the numerous exhibits, the splendid railway engines seem to have impressed me most. And well they might; for amongst them was that famous locomotive, built by the Great Western Railway Company, known as the "Lord of the Isles." It has since been my fate and pleasure to see that grand old engine tearing through the fair capital of the west in which I reside hundreds of times. Further, 42 years after it was shown in the 1851 Exhibition it held its own against the best the United States, or, for that matter, the rest of the world, could produce at Chicago's World's Fair. And when America's finest and most modern railway engine, the renowned "No. 999," also exhibited in the Transportation Building at the same exhibition, was pitted against it for a two-hundred-mile race. National enthusiasm amongst one and all of us who happened to be at the "Windy City" was raised to boiling pitch. And our disgust was just as great when the New York Central Railroad Company, whose property "No. 999" is (well advised, no doubt) removed their crack engine somewhat surreptitiously a night or so before the date fixed for the international contest. Thus it was the race never came off.

Curiously, the one other exhibit that impresses my mind after this long period of time is of quite a different character. It seems to me that some of the most marvellous of all the art treasures collected in 1851 were the wonderful wood-carvings by Mr. Thomas W. Wallis, of Louth. We are accustomed to refer to Grinling Gibbons as a past master of his craft, even as Quentin Matsys, by virtue of his well-known fountain standing by the north-west doorway of Antwerp Cathedral, claims to be the Late 17th century's prince of hammered iron. Yet, in truth, it is difficult to see where the Flemish master's wondrous ability exceeds that of some in our midst? Take, for instance, amongst several who may be mentioned, the work of John Singer and his clever sons at Frome, and although Grinling Gibbons has left us many splendid specimens of his skill, for delicacy of manipulation and exquisite detail he seems never to have been in the running with Wallis, of Louth. This latter great artist's favourite material was lime-wood, and in all he did there was an extraordinary mastery of minute detail. Everything his hands turned out was in scrupulous imitation of nature, but, at the same time, without in the least losing the characteristics of a true plastic style. Even to-day, after all one has seen in a knock-about-half-over-the-world sort of life, I remember his carved "Golden Plover" with infinite delight. Mr. Wallis, years afterwards, nearly went blind, and was generally supposed, in the profession, to be dead. Happily, this impression had no foundation in fact. To-day he is a hale and strong, cheery old gentleman, resident in his native town of Louth. His hours of retirement he is utilising in writing what promises to be a very interesting autobiography of himself, a volume that will include a variety of reminiscences spreading over a period of some sixty years. It is promised from the publisher's hands, I heard recently, this year.

One word in regard to the awards at the 1851 Great Exhibition. Both my grandfathers, William Hems, of London, and George Wostenholm, of Sheffield, received medals. Perhaps few persons living can say the same thing of their respective ancestors?

Here, in Paris, there occurred respectively the International Expositions of 1855, 1867, 1878, and 1889. I don't seem to have any recollections whatever of the first of the French series, but remember well it was in 1867 that season tickets with the photograph of the owner thereon first came in vogue. Likenesses on glass were more common in those days than were prints from negatives. Official orders were issued that all exhibitors, or their representatives, requiring passes, were to attend, bringing their photos to be stamped. At the time I presented my own, a quartet of honest Germans, tall blonde men, arrayed in suits of green, were amongst the applicants. They innocently handed in glass daguerreotypes of their sturdy selves. As the machine that imprinted the photograph upon the season card was a small engine very like unto

those I have since seen stamping five-dollar silver pieces in the Mint at Philadelphia, U.S.A., the faces of the poor Teutons as they looked ruefully at their glass likenesses was a picture never to be forgotten.

Of the next French Exposition, that of 1878, many of us probably retain sunny memories. Before its opening, the Prince of Wales spent much time, here, there, and everywhere, amongst the exhibitors, stimulating and delighting them all. Of course, the late Sir Cunliffe Owen and his staff got the credit for all that was well done in the British sections. But did they deserve it? I think not! The master-mind at Paris that year amongst English officials was Sergeant Wright, of the Royal Engineers. Sergeant Wright (I have no idea whether he still survives) was worth his weight in gold to the exhibitors, and did more useful work for them than did all the rest of the Royal Commission put together.

Three years before (in 1873) the great exhibition at Vienna occurred. It claims a pleasant share of our recollections. What a long ride that was from Antwerp to Vienna! and an especially beautiful one over the portion where the winding Elbe in Saxony flows between perpendicular rocks, almost, if not over, 1,000ft. high, as at Königstein, for instance. Some of these apparently inaccessible precipices are crowned by the ruins of ancient castles, although how they were ever approached is as much a puzzle as are some of the farmhouses one sees perched upon the mountain sides of many of the Norwegian fiords. All along to Bodenbach, the Austrian frontier, the scenery is simply sublime; and not a very long way after leaving picturesque Prague (with its Carlsbrücke Bridge and groups of statuary thereon), Austria's capital—an infinitely fairer city to see than is the equally lively one wherein these lines are penned—is reached. The Exhibition at Vienna was situated in the Prater, one of the largest parks in Europe. At the time of the show the recollection of the Franco-German War was still a very sore point with France. When the German Emperor William paid a visit to the Austrian Exposition, the French Courts were kept strictly closed; but the conqueror and his suite, stealing a march upon his old antagonists, visited their courts one Sunday afternoon when no one else was about. Hearing of this, the poor Frenchmen were furious. One of them, representing a leading firm, Cristoff's, got into an awful fume, danced like mad, and, wiring his principals in Paris, asked for instructions. The answer came quickly, and was pre-eminently practical. It ran: "Let him [the Emperor] in, by all means. It doesn't matter. Perhaps he'll buy"! A sunny memory of Vienna in those days centralises itself around the memory of the late Princess Mary of Cambridge, the popular Duchess of Teck. With characteristic geniality, very pleasant did she make herself amongst all her fellow countrymen. Several times a week she lunched quite *infra dig.* in the British Workman's House on the grounds. One day I bought for some of my womenfolk at home a curious muff, made from the fur of some wild animal, whose rather ferocious-looking head was brought round over to the front, and served to form the lappet of an exterior pocket. This muff her Highness espied, and begged me its use for the rest of the day (towards the close of the exhibition the weather in Vienna was somewhat chilly). When returning it, turning archly to the Prince, who stood by, she said: "Don't I wish someone would buy me such a lovely muff."

Time waits for no man! It goes on apace, and, as in a dream, one seems to cross the Atlantic, and the Great Centennial Exhibition of 1876, at Philadelphia—"the City of Brotherly Love"—is seen in the memory's mist before us. The United States authorities—taking the hint, it may be assumed, from Paris—insisted upon the owners' photographs being upon all season tickets. Further, around the edge of these admittance cards were printed dates, representing one for every day the show was destined to remain open. On the owner presenting himself for admission, therefore, the number corresponding with the current day was nicked, and thus a double entry on one date rendered impossible. Philadelphia, perhaps, remains impressed upon most of us more than anything else by the recollection of its superb city hall, the largest erection, undoubtedly, of white marble in the whole world. The late Mr. McArthur, the designer of this splendid edifice, worked thereupon early and late. Not only was he its architect, but practically his own clerk of works too, nothing,

in spite of the immense size of the structure, apparently missing his eye. He laboured harder even than did the late Mr. G. E. Street upon our own Law-courts—and that is saying a good deal. Both met with the same reward. The incessant strain killed them! One of the most charming suburban drives in the civilised world—especially if behind a couple of first-class trotters—is along the road by the side of a turbulent little stream, a tributary of the Schuylkill's, in the "Reservation Land," as far out from Philadelphia as the Indian Rock. No other country can boast of such a delightful ride, winding as it does through wild scenery, every mile of which is as much public property as are our own parks at home.

From Philadelphia in 1876 to Chicago's World's Fair in 1893 may be somewhat of a "far cry"; but, almost last, Chicago's Exhibition was by no means least. It was undoubtedly the greatest thing of its kind the mind of man ever conceived and carried out. Nor will, one thinks, anything approaching it in magnitude ever be erected again. The effort here in Paris, in view of next year, promises to be a mere nothing to Chicago. But Paris, at least, has an enjoyable climate. Chicago has to endure cutting, biting winds for nearly two-thirds of the year, while during the remaining few months one is almost roasted alive. What a chaos! what a slough of despond! was Jackson's Park up to even a month before the opening of its stupendous show in 1893. Mud was predominant everywhere; in many places the army of waggons waded through it literally up to their axles. Wading was no mere figure of speech—it was a most uncomfortable necessity. Boots were never cleaned in Chicago in those days; they were simply washed in a pail. I remember a little Frenchman, just arrived from Paris, asking me, as he stood considerably more than ankle-deep in mud, the nearest way to the French Court. After directing him, he looked down to where his wholly-invisible feet ought to have been seen, and then, raising his benumbed face upwards, he cried, despairingly: "*Mon Dieu!* And it is for dis—for dis—I half left my own beautiful Paris!"

It may be worth recording that at the opening ceremony on the 1st of May, 1893, by the President of the United States, the only two military attendants on the staff I saw in English uniform were Colonel Edis, F.S.A., the well-known London architect, who looked every inch a soldier in his Artists' Corps uniform, and was the observed of all observers; and my second son, Private Harry Turner Hems, smart in the quieter, if perhaps more serviceable, dark green of the 1st Rifle Volunteers (Devon).

Chicago's mighty—I had almost used an Americanism, and said "almighty"—undertaking practically came to an end with the assassination of Carter Harrison, her mayor, upon the evening of the last Saturday in October, 1893. A singularly fine and active man, Mr. Harrison, late in the afternoon of that fatal day, was chatting jovially with me in the British section—four hours later he lay a corpse, struck to death by a bullet of a miserable assassin. With that shot the curtain fell upon Chicago's World's Fair.

Transatlantic exhibitions are of necessity expensive luxuries for all European exhibitors, but especially have they proved so to English ones. Whilst exhibitors from other countries are invariably liberally helped financially and otherwise by their respective governments, Englishmen get practically no help from theirs. The £66,000 voted by our Parliament towards the expenses of the Chicago Exhibition were frittered away, but not in the interest of the exhibitors. Sir Henry Wood and his Commission contrived to spend almost every penny without apparently benefiting anyone but themselves. Victoria House, the official offices, was situated upon the lake shore, a mile or more from the location of the nearest English exhibitor. Cables from England addressed to exhibitors, care of the Commission, have been known to lie pigeonholed for a week and more after receipt, not one of the staff troubling to deliver them, or to intimate to the interested exhibitor that any sort of communication awaited him. The local management at Chicago by the U.S.A. over-worked officials was bad enough, goodness knows!—but our own administration was infinitely worse. Practically, it was *nil*. The average cost to every exhibitor at Philadelphia in 1876 has been computed at £800; at Chicago in 1893 it may be put down as £1,300.

A year after Chicago came the International

Exposition at Antwerp (1894). Very small in comparison to the former, its shows were of fair merit, but largely consisted of Chicago exhibits, shipped direct across the Atlantic to the busy Flemish port in question. Of the general management there, again the least said thereupon the better. English exhibitors, however, found a good friend in Sir Charles Malcolm Kennedy, C.B., who proved to be at least one right man in the right place; and who, seen and unseen, watched over British interests with a jealous eye.

And now, here in Paris, what of the coming exhibition? Well, notes upon that must be deferred until next week.

Rue de l'Arcade, March 18. HARRY HEMS.

## WESTMINSTER ABBEY ILLUSTRATED.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

DEAN STANLEY, Sir Gilbert Scott, and William Burges must continue to stand conspicuously to the forefront as authorities on the history and architecture of the famous abbey at Westminster. Others, like Mr. W. J. Loftie and Dean Bradley, in a minor degree have been more recently associated with popular volumes on the same engrossing subject, while Neale's History of the Abbey, issued in 1818, is still the most complete work on the history of the building. Messrs. George Bell and Sons have now published a really monumental work\* illustrative of this great church, its monuments and its buildings, giving a comprehensive account of its fabric and its dependent surroundings as they exist at the present time. Mr. Henry John Feasey has contributed an historical summary concerning what Mr. Bell calls "the noblest ecclesiastical building in England," describing the inception and growth of its fabric which has been so closely connected with the Nation's social affairs and personal story not only of many of the sovereigns of England, but of the leading clergy and laity alike. Mr. J. T. Micklethwaite, who succeeded the late Mr. J. L. Pearson, R.A., as architect to the Dean and Chapter, furnishes a valuable paper on the more technical and obscure points associated with the early history of the Abbey and its buildings. The author's connection with the church began many years since, when he acted as assistant to Sir Gilbert Scott,† and certainly no one now can claim to be better informed or more learnedly acquainted with this subject than Mr. Micklethwaite. Mr. Edward Bell, who writes the preface, acknowledges his indebtedness to his associates in this admirable enterprise, which he has served to render complete by an appendix, giving an account of such of the sepulchral monuments as may be considered, in respect to date and decorative features, to belong to the architectural history of the Abbey Church. A great feature of this volume is comprised in the full-page colotype reproductions of photographs executed by Messrs. Bolas, and some of the views—more particularly those of details—were taken expressly for this work under the direction of Mr. Micklethwaite. We are enabled to reproduce, on a reduced scale, four of the illustrations referred to, and before alluding to the volume more generally it may be well to quote some descriptive notes furnished with the plates herewith represented. When in 1502 and the following year, Henry VII. removed the Lady-chapel to make way for the costly and elaborate structure, which, in a much restored form, still remains, he also, prompted probably by the recent death of his wife, planned a magnificent chantry and tomb for himself and her. He had already, in the preceding year, begun a tomb of the same kind at Windsor in honour of his uncle, Henry VI.; but with the building of the chapel at Westminster this design was suspended; and in 1512 so much as had been executed by an English artificer was transferred to Westminster, and the completion of the monument was placed in the hands of the Italian artist Torregiano. The tomb itself "consists of a sarcophagus of black marble, divided by gilded bronze pilasters, on which rest the effigies of the King, and Elizabeth of York, his Queen, in

\* Westminster Abbey Historically described by HENRY JOHN FEASEY, with an account of the Abbey Buildings, by J. T. MICKLETHWAITE, V.P.S.A., Architect to the Dean and Chapter. An appendix on the Medieval Monuments, by EDWARD BELL, F.S.A., and seventy-five plates. London: George Bell and Sons, 1899. 25 5s.

† A list of the master masons and architects of the Abbey was given in the R.I.B.A. Journal, Dec. 20, 1888, compiled by the late Wyatt Papworth.

bronze. In the panels are bas-reliefs in bronze of the Virgin and Child, the Archangel Michael, the two St. Johns, SS. George of England, Anthony of Padua, Christopher and Vincent, the Magdalene, and SS. Barbara and Anne. These bas-reliefs are set in wreaths, carved out of the black marble. At the ends of the tomb are the armorial bearings of England, France, Wales, and Mortimer. All the details of this beautiful work, executed in bronze, are unmistakably Italian, and probably executed by Torregiano himself; but it is almost certain that in carrying out the accessories Torregiano employed English workmen." The screen surrounding the tomb is generally supposed to be the work of Esterfield, and it is likely that the great bronze doors between the chapel and the Abbey Church are products of the same English school. We publish an illustration of them, and at an early date will give some details to a good scale. Torregiano also made the high altar, supported on white marble pillars, and surmounted by a baldachino for the chapel, which was completed in 1522, but destroyed 120 years later. It stood at the head of Henry VII.'s tomb, and had angels above the cornice and Royal Arms. The frieze of the small altar erected by Dean Stanley, and two of the marble pillars which support it, are the only remaining relics of this work. In Dean Stanley's "Westminster Abbey Supplement" an interesting account is given of the opening of the vaults under Henry VII.'s monument in 1869. Our second photographic plate shows in the first half the north turret door of Henry V.'s chapel, which is located between the entrance to Henry VII.'s chapel, and the easternmost bay of the choir apse. The view is taken looking west, standing in the chantry, so that the rear side of the high altar screen is seen beyond the Confessor's chapel. The altar in Henry V.'s chapel was restored by Dean Stanley, who inclosed in it the remains of Queen Catherine of Valois, which underwent various translations, and for two centuries lay in an open coffin near the tomb of her husband. On either side of the altar and above it are recesses, once closed by shutters, and intended for the keeping and display of relics. Henry V. directed by his will that a "high chantry" should be built over his body in Westminster Abbey Church, and so it came about that this chapel, which now forms so striking a termination to the eastern extremity of the choir, was carried out over the ambulatory. The front of the structure is described by Mr. Bell as being somewhat in the form of a gate-house, having an octagonal turret at each angle and an elaborately vaulted chamber or passage, containing the tomb, beneath an upper story, to which access is gained by stairs in the turrets. This was the "high chantry." In front, as will be seen by the view, it has only a low parapet, and was so designed that the priest during the services might be visible from distant parts of the church. The sides of this chapel are richly decorated with numerous figures in niches. The altar was dedicated to the Annunciation. On a beam above the chantry are still to be seen the helmet, shield, and saddle which formed part of the insignia carried at the funeral.

Our last picture represents the famous Jerusalem Chamber, of which no notice appears to be furnished in the present volume, excepting the incidental mention of the death of Henry IV., which occurred in this room on March 13th, 1413, of epilepsy, with which complaint he was attacked while praying before the tomb of the Confessor. The Jerusalem Chamber was the guest chamber for the abbot's house, and was erected by Abbot Littleton between 1376 and 1386. It most likely obtained its name from tapestry scenes of the history of Jerusalem, with which it was hung. Shakespeare gives the last words of Henry IV.:-

*King Henry:* Doth any name particular belong  
Unto the lodging where I first did swoon?  
*Warwick:* 'Tis call'd Jerusalem, my noble lord.  
*King Henry:* Laud be to God!—even there my life must  
end.  
It has been prophesied to me many years,  
I should not die but in Jerusalem;  
Which vainly I supposed the Holy Land:  
But bear me to that chamber; there I'll lie;  
In that Jerusalem shall Harry die.

2 Henry IV. Act IV. Sc. 4.

Dean Williams, in the time of James I., decorated this beautiful old room, but the glass in the windows is more ancient. The panelling is in cedar, and over the chimney-piece in the modern painted frieze is a representation of the death of Henry IV., with the legend formed by the

last line in the above quotation. These decorations include a representation of the coronation of Queen Victoria. The plaster ceiling was removed in Dean Stanley's time, and the present open timber roof was decorated in colours. For many years previous to the erection of the Church House, Dean's-yard, Convocation held its meetings in the Jerusalem chamber. Episcopalians and Presbyterians met there for ecclesiastical disputations during the 17th century, and the Royal Commission on ritual was held in this room in 1867.

The paper included in the volume before us, from the pen of Mr. Micklethwaite, is illustrated by plans drawn by the author. The first shows a suggested arrangement and extent of the older or Confessor's church, dating from 1055 to 1220, and a section is also furnished. A view is given in this connection of the still-existing chamber of the Pyx, so named from the chest in which sample coins from the Mint reserved for trial were deposited, and which at one time was kept there. It was, however, the Monastic treasury, and passed to the Crown only at the dissolution of the abbey. This apartment was formed in the 13th century out of two bays of the vaulted basement of the dorter built in the 11th. There had been an earlier division of the basement. Mr. Micklethwaite relates in detail his painstaking history, giving his authorities and a ground plan of the existing buildings, which, broadly speaking, date from 1055 to 1512. A longitudinal section which displays by varied hatchings the main general periods of its parts, is also printed with the text. The church as it stands comprises three distinct buildings, the construction of which extended over a period of one hundred years, and was practically completed in 1410. Henry III. built the east end. Edward I. carried on the work, the nave being added by Richard II. and Henry V., or, properly speaking, that portion left incomplete by Edward I.; the chantry of Henry V. and the chapel of Henry VII., by order of the monarchs bearing those names. Sir Christopher Wren rebuilt the north transept front, now pulled down and replaced a few years since by the design of the late J. L. Pearson, R.A. One of Wren's pupils (Hawksmoor) built the western towers under George II. Sir Gilbert Scott, who lies buried in the nave by the side of Sir Charles Barry and G. E. Street, rebuilt the Chapter-house, a work begun in 1866, and Scott also refurnished the altar and choir as they now stand at that time. He also did the new north portals and erected the pulpits. Sir Christopher Wren's drawing of the north transept was published in the BUILDING NEWS for October 26, 1888. The restoration work of the west front and towers is now in process of doing under the direction of Mr. Micklethwaite.

With regard to Messrs. Bell's charming volume, we may add that it is admirably produced in green linen, with a parchment backing. The printing and type leave nothing to be desired. The photographic views in almost every instance are excellent, and, what is more, they are taken from really important points of view, and always illustrate something worthy of record. It would have been an advantage to the general reader to have had the various positions indicated on a key-plan with the numbers of the plates figured for reference. Unfortunately, as it is, the plates themselves are not numbered, and the index at the end of the book is too sparse to be of much use. Every architectural library will remain incomplete without this book. It would grace the shelves of any collection of art volumes. In America, we can understand Bell's "Westminster Abbey" meeting with a large demand. The Chapter-house interior should have been included among the illustrations, as it forms a very important part of the Abbey buildings, even if some people wish it had not been restored.

The following references may serve to assist those who are particularly interested in the subject. We have published from time to time many illustrations of the Abbey, and without a key of this kind it is not easy to look up any special point; we therefore add a list made up to date:-

The following illustrations of Westminster Abbey have appeared in the pages of the BUILDING NEWS:- Ground plans, July 2, 1869, and May 16, 1884; do. of conventual buildings (by late Rev. Mackenzie E. C. Walcott), May 31, 1872, and March 3, 1876; do. of St. Catherine's chapel, June 28, 1872; do. of apse (by late G. E. Street), May 30, 1879; ancient views by Braun (1872) and Faithorne (1858), June 28, 1878; west front, Jan. 15, 1886; Wren's autograph drawing of north front, Oct. 26, 1888; north transept exterior (the late Herbert E. Gribble, sketch-book series, Nov. 17), Feb. 4, 1870; north transept,

as restored by Scott and Pearson, 1877-91, June 5, 1891; do. (drawing by the late J. L. Pearson), Dec. 9, 1892; Nathaniel Hitch's new statues for same, April 10, 1891; north transept (the late Sir G. G. Scott's restoration, May 3, 1879; east end of choir, Jan. 22, 1880; choir from apsidal chapel (R. J. Johnson), April 17, 1885; three interiors, choir, north transept, and north aisle of choir (Herbert Railton), Jan. 1, 1892; bay of choir (Sydney Vacher), Jan. 15, 1877; St. Edward's shrine in the 14th century (T. H. Longfield), Sept. 10, 1875; Islips Chapel (A. Needham Wilson), May 30, 1899; doorway to St. Erasmus' Chapel (A. Bennett Bamford), Dec. 6, 1889; restoration of Henry III.'s tomb (T. H. Longfield), April 1, 1887; tomb of Aylmer de Valence (G. H. Drinkwater), Aug. 23, 1873; do. (by T. Miller), Feb. 6, 1880; iron grille, Queen Eleanor's tomb (T. F. Pennington), Aug. 8, 1879; iron grille in Henry V.'s chantry (G. A. T. Middleton), May 20, 1898; gates of Henry VII.'s Chapel (G. E. Lawrence), April 10, 1885; panel in Henry VII.'s chapel (I. J. Phillips), July 30, 1890; bay of south transept and triforium carvings (J. Atwood Slater), Jan. 12 and 19, 1883; do. upper arcade (the late Jas. Hicks—sketch book series No. 14), Jan. 14, 1870; diagram of groined vault of nave (Lawrance Harvey), Nov. 17, 1893; pulpit (Sir G. G. Scott's new), Sep. 12, 1862; memorial brasses (to Sir Gilbert Scott), Sep. 1879; (to G. E. Street), Oct. 10, 1884; carved dragon from a tomb, Jan. 15, 1888; cloisters, north walk of (W. H. Lockwood), April 12, 1872; do. (by J. McLaren), Feb. 15, 1884; do. lavatories in south walk of cloister (A. Needham Wilson), April 3, 1885; chapter-house entrance (M. Allen), Jan. 27, 1881; do., panel in doorway (T. F. Pennington), July 23, 1870; proposed Campo Santo (Sir G. G. Scott's design), Feb. 29, 1884; do. (J. L. Pearson's design), perspective and plans, Dec. 26, 1897.

### THE SURVEYORS' INSTITUTION.

AT the ordinary general meeting of the above-named institution, held on Monday evening last, a paper was read by Colonel Raikes on "Valuation and Rating in Respect of the Tithe-Rent Charge," based on the preliminary report of the Royal Commission on Rating. The author commenced by giving a history of tithes in England and the purposes for which they were enforced, being at first devoted to "the maintenance of the Church's fabric, the use of the bishop and the incumbent, and also, to some extent, to the feeding of the poor and the entertainment of strangers." When Henry VIII. dissolved the monastic or religious houses, the "appropriated" tithes were vested in the Crown, and afterwards granted partly to religious foundations and partly to lay-rectors or "impropriators." The maintenance of the poor had, previously to 1536, legally devolved upon the evenness of the vicars or secular clergy, supplemented by the alms of the monasteries, collegiate churches, hospitals, and cathedrals. It then became necessary to provide other means for their maintenance, and by the Act of 27 Henry VIII., it was enacted that in every parish voluntary or charitable alms should be collected for this purpose, and provision was made to "compel all and every the said sturdy vagabonds and valliant beggars to be set and kept to continual labour, in such wise that they and every of them may get their own livings with the continual labour of their hands." These alms were only to be "gently asked or demanded"; but as they proved insufficient, in 1562 the bishop was empowered to commit to general sessions all who obstinately refused to pay, with a view of having them sent to prison if they still remained in arrear. In 1572 the first assessment was made of all inhabitants to poor-rate, and in 1597 the burden of relieving the poor became compulsory. In 1601 the famous Act 43 Elizabeth was passed, by which parsons and vicars were mentioned specifically as liable to be rated as inhabitants, according to their ability, but not as appropriators of tithe, whereas the impropriate tithes—i.e., those held by lay rectors and separated from the benefice—were, together with coal mines and saleable underwood, specifically mentioned as taxable, all other mines and woods being exempt till 1874. But the parsons' tithe, being taken in kind, was readily cognisable, and he gradually came to be rated on this tithe in the same way as the lay impropriator. By 1840 the custom of rating tithe had become so general that all attempts to evade payment were futile. Although until 1836 tithe had been generally paid in kind, it had in some few cases ceased to be so in consequence of the expense and the bad feeling frequently engendered. But the Act of that year substituted a rent charge based on the estimated value of the old tithe, and varying from year to year with the price during the previous seven years of the principal cereals—wheat, barley, and oats. This charge had varied with the varying fortunes of agriculture, the average from 1836 to 1898 being 97 per cent. of the amount fixed in the former year. At the present value of £100 of tithe rent, charge was only £68, while rates had probably increased by 30 per cent.

during the 62 years, and the description of tithe rent-charge as a "fixed income," which a Royal Commission had recommended should on that ground be free from new or additional rates, must, the author thought, sound somewhat illusory to the present tithe owners. Tithe owners contended that a deduction in assessing rent-charge should be made of 15 per cent. for rates, repairs of chancel, expenses of collection, &c., and 30 per cent. for tenants' profits—i.e., personal services, and that the tithe should be dealt with as land, in order to have the benefits of the Agricultural Rates Act, including the return of the proportionate rates paid since the Act came into force two years ago, but the author, while not being able to contend that the tithe should not pay rates, thought that if 5 per cent. were deducted for cost of management and collection, and 50 per cent. off the rates to cover all other claims, few tithe owners would complain.

A discussion followed, in which Messrs. E. P. Squarey, A. Buck, Rev. Lamplugh, J. H. Sabin, H. M. Grellier, and E. W. Peterson took part.

While we are going to press there are being examined at the temporary premises of the Institution some 300 candidates for the Professional Associateship and the Fellowship. The outdoor work in surveying and levelling, and in practical timber valuing and measuring, occupied the whole of Monday and a portion of Tuesday, and this part of the examination was conducted in the fine park of Osterley, near Isleworth, by the kind permission of the Earl of Jersey.

#### THE APPOINTMENT OF SUPER-INTENDING ARCHITECT, L.C.C.

**A**FTER months of inquiry and hesitation, the London County Council have selected a successor to Mr. Blashill, their superintending architect, in the person of Mr. W. E. Riley, assistant permanent director of engineering works at the Admiralty. Last autumn, it will be remembered, the County Council advertised for candidates, offering a salary of £1,500 a year; but, although nine gentlemen were selected by the General Purposes Committee from the 68 architects who responded to the advertisement, it was thought no one of them possessed the exact qualifications for filling the office. It was then resolved to increase the proposed salary to £2,000 per annum, and 43 applications were sent in. These were weeded down to nine, who were interviewed by a sub-committee, who further reduced the number to four. The committee submitted to the County Council on Tuesday the names of Messrs. Frederick R. Farrow and W. E. Riley, and recommended that the latter gentleman should be appointed to the post.

When the recommendations came up for consideration at the Council meeting, some objections were taken to the proposed appointment on the ground that the selected candidate had had little experience in dealing with the London Building Act. Mr. Richard Strong (chairman of the committee) pointed out that Mr. Riley had had large experience at the Admiralty in regard to different kinds of architectural work, some of which had been carried out by the direct employment of labour and some by contract. Every investigation had been made into his qualifications, the result being highly satisfactory. He felt sure that Mr. Riley would be competent to deal with any of the Council's work which might come before him. The recommendation of the committee was adopted, and Mr. Riley, having been called in, briefly returned thanks for his appointment.

Mr. William Edward Riley, A.R.I.B.A., M.Inst.C.E., the newly-elected administrator of the London Building Act and architectural adviser to the London County Council, is 46 years of age, and was born at Ossett in the West Riding in 1852. Mr. Riley was articled in 1868, and having served four years in a provincial town with an architect and engineer, obtained an appointment as architect's assistant in the office of Messrs. Beek and Lee, of Finsbury-circus, E.C., with whom he remained two-and-a-half years; and at that period personally designed some important blocks of workmen's dwellings for the Improved Industrial Dwellings Company. Another like period of two and a half years was devoted to general practice. In April, 1877, Mr. Riley was the only successful competitor in an open examination for the appointment of architectural draughtsman in the department in which he has during the subsequent twenty-two years risen

through every executive grade to the highest possible position, that of senior permanent civil officer, a position attained some three and a half years ago. The syllabus for the competitive examination includes the history and styles of architecture, drawings, designs, and details of architectural works and ornaments; strength and use of constructional materials, specifications, measurement of quantities, and estimates of cost of building works. He also passed in 1882 the voluntary examination of the Royal Institute of British Architects, and was elected an Associate, his sponsor being Mr. Blashill. Mr. Riley has had exceptional and varied experience in building operations at home and abroad, having had independent charge of the whole of the Admiralty works at Bermuda, Chatham, Portsmouth, Devonport, and Malta collectively for nine years, and during the last three years he has had the personal charge of the whole of the Coastguard buildings, designs, and contracts in Great Britain. Among the recent designs made either personally

MR. W. E. RILEY.

by Mr. Riley or under his direct control are those for several important buildings in Malta requiring sympathetic treatment to avoid violating the historical surroundings; the extension of the Naval Engineering College at Keyham, and the new Observatory buildings at Greenwich. At 21, Northumberland-avenue, Mr. Riley has gained the character of an exceptionally hard worker, and one, therefore, able to obtain from his staff willing and efficient services, combined with efficient control and economical administration of the department.

The design of Messrs. Atkinson Bros., of Newcastle-on-Tyne, has been selected for the stained-glass window to be erected in St. Silas's Church, Heaton, an offering from the children and Sunday-school teachers. The subject of the window is "Christ Blessing Little Children."

A model house erected by the corporation was opened at Stonehaven last week. It has been built from designs by Messrs. J. and J. A. Souttar, architects, of Aberdeen, is situate in Allardice-street, provides 40 cubicles, and has cost £1,400.

The contract for the erection of workshops and offices at Hadley, near Wellington, Salop, on the site of the old Castle Ironworks, has been secured by Messrs. Hughes and Sterling, of Liverpool, and the cost of the buildings alone will be between £30,000 and £40,000. The work is being done for Messrs. Milnes and Company, of Birkenhead, and it is proposed to manufacture tramcars, omnibuses, &c., in which occupation about 600 or 700 hands will be employed.

The Court of Appeal (Lords Justices A. L. Smith, Collins, and Romer), dealing on Saturday with cases under the Workmen's Compensation Act, decided that a county-court judge who had disposed of a matter under the Act could not grant a new trial. In these cases the judges, under the Statute, sat as arbitrators, and were not vested with their ordinary county-court jurisdiction.

#### COMPETITIONS.

**FLETON.**—For the new board school to accommodate 600 children, seven competitive sets of plans were submitted, and those by Mr. W. Boyer, of Cowgate, Peterborough, have been selected.

**THE LEEDS NEW MARKET HALL COMPETITION.**—The markets committee has resolved to apply to the President of the Royal Institute of British Architects, requesting him to nominate three gentlemen, any one of whom the committee might invite to act as assessor.

#### PROFESSIONAL AND TRADE SOCIETIES.

**ARCHITECTURAL SOCIETY OF GLASGOW.**—Mr. James A. Love Tindal, writer, Glasgow, delivered a lecture last week before the architectural branch of the Glasgow Philosophical Society, at the Society's Rooms in Bath-street, Glasgow, his subject being "The Workmen's Compensation Act, 1897, so far as it affects Builders and Architects." Mr. P. Macgregor Chalmers, president, occupied the chair. The lecturer said that by the Workmen's Compensation Act of 1897, workmen were practically insured at the expense of their employers and the trade, and as a necessary result, at the expense of the consumers of the commodities produced by that trade. So far as the 1897 Act was concerned, the law of negligence might have had no existence, as a workman coming under the Act was entitled to compensation irrespective of negligence or carelessness on his part, so long as he was not proved to have been guilty of serious and wilful misconduct. The Act was probably the commencement of a system of compulsory restrictions on the freedom hitherto exercised by employers and their workmen, and further legislation extending and emphasising the principles which it promulgated might be expected. Mr. Tindal thereafter took the Act clause by clause, explaining the effect of each specially with regard to the building trade, and pointed out various conditions which restricted the operation of the Act, particularly that its provisions would not apply unless the building being constructed, repaired, or demolished exceeded 30ft. in height. A discussion followed.

#### CHIPS.

The gas committee of the town council of Leeds propose an expenditure of £111,630 for the extension and enlargement of mains required during the next five years.

The corner-stone of the electric-lighting station in connection with the Barnsley Town Council's scheme for supplying electric light and energy was laid on the 9th inst. The town council have obtained power to borrow £25,000, and the premises now being erected in Beckett-square from designs by the borough surveyor will house an installation capable of supplying 6,000 8-candle-power lamps, and will be capable of extension.

Colonel A. G. Durnford, R.E., held a Local Government Board inquiry at Ilfracombe on Friday concerning an application by the urban district council to borrow £5,659 for public improvements. It was proposed to spend £3,156 on street improvements, £1,340 on public walks and pleasure grounds, £607 on water supply, £507 for new sewerage works, and £39 on the fire brigade.

The West Lancashire Rural District Council met at Ormskirk on Monday to make the final selections for the offices of surveyors over the highways rendered necessary by the taking over of the powers of the highway boards in the district. For the chief surveyorship (the starting salary of which is £150 a year) six had been selected, and Mr. Charles Law-Green, A.M.I.C.E., of Croydon, was appointed. For the Ormskirk district, Mr. Hugh William Chadwick, of Croston, was unanimously appointed, and the remaining appointments were as follows:—Southport district, Mr. John Orritt (surveyor to the present highway board); and Tarleton sub-district, Mr. William Banks, of Chapel-lane, Tarleton.

The Light Railways Commissioners held an inquiry in the town-hall, Rhyl, last week, respecting an application made to lay a light railway between Rhyl and Prestatyn. The proposed railway will commence at the East Parade near the Westminster Hotel, then proceed along the Marine Drive, pass the Golf Links, and on to Prestatyn, where it will terminate in High-street. The length will be three miles and five furlongs, of which two miles and seven furlongs will be a single line; the remainder will be doubled. The railway will, if sanctioned, be worked by electrical power, on the overhead trolley system, and the gauge will be 3ft. 3in. The estimated cost is £26,000.

WESTMINSTER ABBEY.—NEW PALACE OF JUSTICE, BUDA-PESTH.—NEW HOSPITAL, BOSCOMBE.—HOUSE NEAR MANCHESTER.—HOUSE AT HERNE BAY.

## Our Illustrations.

WESTMINSTER ABBEY.

(See review on page 404.)

NEW PALACE OF JUSTICE, BUDA-PESTH.

We published the plan and three views of this grand group of legislative buildings in our issue for Feb. 17 last, when we printed an account of the undertaking, which was carried out by the Hungarian Government at a cost of £295,000. To-day we give a view of the grand staircase, with Mr. Alajos Stöbl's figure of "Justice" in the central bay of the arcade, facing the entrance of the great hall. A reference to the plan will explain how this staircase rises from the right and left-hand sides of the hall. Prof. Alois Hausmann, Hon. Cor. Member of the R.I.B.A., is the architect of the work. We are indebted to Mr. Ernst Wasmuth, of Berlin, for the loan of the colotype view herewith reproduced. It forms one of the plates in the last part which he has sent us of Mr. Hugo Licht's "Architektur der Gegenwart," a folio assemblage of contemporary buildings of the greatest interest to those engaged in building operations.

NEW HOSPITAL, BOSCOMBE, BOURNEMOUTH.

This Hospital has been designed on the pavilion system, and in order to obtain efficient basement ventilation the entire building is raised on piers and arches, the floor level being 7ft. above the ground, with the exception of the main corridor, the space under which will be utilised to carry the water-gas and electric mains. In order to provide for future extension, the walls of the pavilions will be built of sufficient strength and thickness to carry additional floors over when the necessity for increased accommodation demands. The hospital provides for 34 beds, with provision to increase the number to 68. The buildings will be of red brick and Douling stone, with green Westmoreland slate roofs. Fireproof construction with terrazzo finish has been provided in the floors throughout. It is proposed to proceed with the first section, comprising two of the pavilions with the necessary corridor and offices, and the separation ward forthwith. The architect is Mr. G. A. Bligh Livesay, of Bournemouth, whose design was successful in the preliminary scheme for remodelling the existing hospital.

HOUSE NEAR MANCHESTER.

This house, about to be erected, has been designed with the entertaining rooms towards the garden, as the site had a north aspect. The ground story will be faced with first-quality red Accrington bricks set with a weathered joint, the first story being tile-hung with best red Ruabon weather tiling, and the gables will be executed in half-timber work of red deal. The roof will be covered with best Broseley tiles. The stable block will be faced with "white ends," with arches,

bands, quoins, &c., of red Accrington bricks. The architects are Messrs. C. K. and T. C. Mayor, of John Dalton-street, Manchester.

HOUSE AT HERNE BAY.

The drawings show the plans and front of a house facing the sea, now being erected on the East Cliff at Herne Bay, for Mr. Charles Chalmers. It is faced with red bricks, with red Bowstone dressings, and covered with Broseley tiles. The house is most pleasantly situated—just on the rise of the hill on to the Downs. Mr. C. E. Skinner, of Chatham, is the builder, his contract price being £3,800, and Mr. G. E. Bond, of Rochester, is the architect.

\*\*\* THE illustrations of the Crown Theatre, Peckham, in our issue of the 10th inst., were reproduced from photographs by Messrs. S. B. Bolas and Co., who have written demanding this acknowledgment. We had no knowledge of the fact at the time, or should, of course, have willingly appended their name. Architects, when sending us photographs, should kindly mention the name of the photographer, or we may quite innocently infringe copyright, which is the last thing we desire to do. Architects will do well to bear in mind that, although they may employ a photographer to photograph a building for them, the copyright of the photograph is *his*; and they will do well to stipulate for the right to reproduce it in our pages or those of the other professional journals, or they may occasionally land us in a difficulty.

Mr. E. A. Sandford Faucett, one of the inspectors of the Local Government Board, held an inquiry on March 6 at Sevenoaks, as to sanction for a loan for £1,800 for the erection of houses under the provisions of the Public Health Act, 1875, and the Houses for the Working Classes Act, 1890. The land, 2 roods 38 perches in extent, will be purchased for £160 from the rector. The estimate of Mr. Constable, the builder, for the erection of six cottages is £1,463 10s. 9d., and the architect's charges will bring the total expenditure up to about £1,750. The rent of the cottages will be 5s. per week.

A new church of St. Faith is in course of erection at Waterloo, Liverpool, at the sole cost of Mr. Douglas Horsfall. The architects are Messrs. Grayson and Ould, and the contractors are Messrs. Roberts and Robinson, both of Liverpool. The style adopted is Decorated Gothic of a simple nature. The nave will seat 650 worshippers, and the total accommodation, including choir and transept, will be 800. The materials used are red Runcorn stone and red Accrington bricks, with hammer-beam roof, the thrust from which is transmitted by flying buttresses to the aisle walls. The church is now about half-built.

The Board of Trade have recently confirmed the following orders:—North Shields, Tynemouth, and District Light Railways Order, 1898, authorising the construction of light railways in the townships of Chilton, North Shields, Tynemouth, and Cullercoats, and the urban district of Whitley and Monk-eaton; the Leek, Caldon Low, and Hartington Light Railways Order, 1898, for the construction of light railways from Cheddleton Junction, on the North Staffordshire Railway, to Caldon Low and Hulme End; and the Kinver Light Railway Order, 1898, authorising the construction of light railways from Stourbridge to Kinver.

Mr. Henry Holliday has just completed a large altar picture of the "Last Supper" for the decoration of the east wall of Kirkby church, near Liverpool. The work is executed in glass mosaic, framed with a border in opus sectile, in which symbolic figures are treated in a rather more decorative and conventional manner than in the picture. The material is for the greater part the dead glass manufactured by Messrs. Powell and Sons; but the designer has introduced some American glass having the variety of colour and character of onyx.

At the last sitting of Glasgow Dean of Guild Court 48 new cases were passed, the valuation amounting to £166,000. A lining was granted for the erection of a botanical laboratory at the University. The lecture-theatre will have accommodation for 256 students, and there will be a laboratory with tables for 100 elementary students, and a smaller laboratory for advanced students. The other rooms include a museum, herbarium, bacteriological laboratory, professors' and assistants' rooms, and workshop. There will be accommodation for 420 students.

The Light Railway Commissioners, who held an inquiry into the proposed Trent Valley Light Railway on Feb. 16 last, have granted the application as applied for in the Order deposited with them in November last. The engineers are Messrs. Jeyes and Godden.

## OBITUARY.

THE death occurred at Paris, on Thursday evening in last week, of M. KRANTZ, at the age of 82. He was born at Givet, Ardennes, and was educated at the Polytechnic School, Paris, as a civil engineer. In 1867 he designed for the International Exhibition a building so constructed that by walking round its ring the visitor could see everything exhibited of a particular class, while by striking down from the circumference to the centre he saw the entire products of a particular country. M. Krantz also assisted in improving the navigability of the Seine, and during the siege of 1870 he constructed bridges to facilitate sorties. In July, 1871, he was elected a Deputy for the Seine, and drew up various reports on railways. In December, 1875, he was elected a life Senator, and in 1878 he was Commissioner-General of the International Exhibition. His nephew, M. Camille Krantz, is now Minister of Public Works.

## CHIPS.

There has been introduced into Roseburn Free Church, Edinburgh, a two-manual pipe-organ, built by Mr. James J. Binns, Bramley Organ Works, Leeds. The total number of speaking stops is 20, number of pipes 1,097, couplers and accessories 15. The organ is built in the recess of the north gallery. The case is of fine pitch-pine, with bays of silvered pipes.

The City Court of Common Council have decided to spend £2,000 in extending the newspaper-room at the Guildhall Library and improving the lavatory accommodation in connection therewith.

New branch premises have just been completed for the London and Westminster Bank at the corner of City-road and Old-street. Up to the first-floor cornice the building, which is Italian in treatment, is constructed in red and grey Aberdeen granite, while the upper part is in red brick with Portland stone piers. The building consists of three stories, the apartments over the ground floor forming the club premises for the Finsbury Central Club. Mr. Bennett, of Cheapside, was the architect; Messrs. J. Grover and Sons, of New North-road, were the builders; and Mr. E. Seale, of Camberwell, executed the carving.

A new Liberal clubhouse is being erected in Hatfield-road, St. Alban's, from plans by Mr. S. N. Edwards. The building covers an area of 32ft. by 50ft., and is two stories in height, the style being domestic with steep tiled roofs. The facings are of brickwork and rough cast cement. Mr. E. Dunham has taken the contract at £878.

The commissioners under the Light Railways Act have authorised the construction of a light railway from Trowse to Beccles, *via* Loddon. The projected railway is 17½ miles in length, and is to be constructed on a gauge of 4ft. 8½in. The speed is not to exceed 25 miles an hour. Junctions will be made with the Great Eastern Railway system at each extremity of the line.

The memorial to the late Lord Leighton, which Mr. T. Brock, R.A., has in progress, shows an effigy of the artist on a sarcophagus. At the head is a figure of Painting, and at the feet Sculpture. The commission for the memorial statue to Millais, which will be erected at the Tate Gallery, Millbank, has also been intrusted to Mr. Brock.

A carved-oak chancel screen has just been erected at Holy Trinity Church, Chester, and is the only chancel screen at present in any church in the city. It is of 14th Century character, and light in design. There is a wide central doorway, with four bays on either side, all surmounted by crocketed gables, the middle one being carried considerably higher than the others, and crowned by a cross. A feature is the large number of carved statuettes that occupy the niches (all cut in the solid timber) upon the eastern as well as the western face. The work has been executed by Messrs. Harry Hems and Sons, of Exeter.

The retirement will shortly take place of Mr. Harold Copperthwaite, J.P., of York, engineer to the North-Eastern Railway Company, which position he has held since 1874, when he was appointed to succeed Mr. Thomas Cabry as engineer of the southern division.

The Admiralty have sanctioned extensive new works in Devonport Dockyard; £25,000 will be spent on new workshops and preparations for another building slip; and the Keyham machine shop, brass foundry, and police quarters are to be extended at the cost of £12,000. At the Royal Naval Barracks, Keyham, a church is to be built at a cost of £8,000. In Stonehouse £13,000 is to be spent in extending the Royal Marine Barracks, over £60,000 in increasing the accommodation at the Royal Naval Hospital, and £16,000 on the new coopers' yard at the victualling yard.

## Engineering Notes.

**LEEDS.**—In July electric tram-cars will probably be running on the Chapeltown and Headingley routes. Rapid progress is, says the *Leeds Mercury*, being made with the extensions to the electric generating station at Crown Point. The existing premises are being more than doubled in size, and workmen are putting the roof on to the new portion. When this is complete, the two apartments will be thrown into one. This will form one of the finest engine-rooms in the country. The size of the engine-room will be about 100ft. by 88ft. Built of red brick, it is lined with glazed bricks. The additional plant will include four new boilers, two 1,200H.P. power engines, and further dynamos. When all is finished, the station will be able to supply power sufficient to run 100 electric cars. Messrs. Gould are doing the building work, Messrs. Fowler have the contract for the engines, Messrs. Greenwood and Batley that for the dynamos, and Messrs. Clayton, Son, and Co. are supplying the boilers. The city engineer, Mr. T. Hewson, is superintending the carrying out of the work.

**PENARTH.**—A subway, 6ft. in width, and with 6ft. 6in. of headway, is being constructed under the River Ely at Penarth, to afford better pedestrian communication between the Docks and Cardiff. The Greathead system is adopted, and cast-iron segments are used instead of steel for the lining. The subway will be reached by an inclined plane on either side. The tunnel is nearly 50ft. below high-water mark, and will have a total length of 1,250ft., with an external diameter of 10ft., and a clear internal diameter of 8ft. 10in., the space of 2ft. 10in. outside the footway being utilised for four pipe lines conveying the company's hydraulic power, gas, and water from the dock works to the harbour and other Taff Vale property across the river. The gradients at each end are 1 in 9, and under the bottom of the river bed they are to be connected by a vertical curve of 800ft. radius. The engineer is Mr. George T. Sibbering, M.I.C.E., of the Taff Vale Railway Company, and the contractor Mr. Thomas Taylor, of Pontypridd. The work has been in progress about two years, and two-thirds of the boring operations are completed.

## LEGAL INTELLIGENCE.

**ABBEY MANSIONS ONCE MORE.**—William R. Rickard, the builder of Abbey Mansions, Victoria-street, again appeared before Mr. Marsham at Westminster Police-court on Monday to summonses with respect to alleged breaches of the Building and Dangerous Structures Act. The proceedings really had reference to the condition of the building at the early part of last year. It may be remembered that Mr. Marsham dismissed summonses supported by the district surveyor, Mr. E. Dru-Drury, holding that the buildings, as Crown property, were exempt from proceedings. A special case was stated, and the matter was now remitted to the magistrate, his view of the matter as to Crown property not being upheld by the superior Court. Pending the decision of the High Court, there were further proceedings before Mr. Marsham, and the matter was referred to arbitration. The arbitrator decided in favour of the views of the district surveyor, and the County Council now asked for the costs of these proceedings, it having cost £49 to take up the arbitrator's award. A mass of evidence had to be taken as to the condition of the premises last year, and as to the alleged excessive height, Mr. Ivory contending for defendant that the building had not been erected to a height greater than 80ft., exclusive of ornamentalities. He also submitted that the erection of the building was a clear case of acquiescence on the part of the Council, which amounted to consent. Mr. Marsham said he should see the buildings, and would give his decision a week hence.

**ARBITRATION RELATING TO UNEXECUTED WORKS INVALID.**—DAVIS V. WITNEY URBAN DISTRICT COUNCIL.—Sitting in the Court of Appeal on the 15th inst., Lords Justices A. L. Smith, Collins, and Romer gave judgment in this case, the plaintiff's appeal from a judgment of the Divisional Court, consisting of Justices Ridley and Channell. It was an action on an award, certain questions of the defence and reply on which had been set down for argument by an order of a Master in Chambers. The urban district council in April, 1897, gave the plaintiff notice that they proposed, under powers given them by the Public Health Act, 1875, to make a new sewer, part of which would pass under some fields belonging to her. In September, Mrs. Davis claimed £300 as compensation for injury and damage that would be suffered by her by reason of the

intended construction and extension of the proposed sewer through her property, and that she required an arbitration. The lady also gave notice that she had appointed her arbitrator. The matter went to arbitration; but, before the award was made, the council abandoned the scheme, and gave notice to the plaintiff of their decision. The arbitrators, however, made their award, and directed the council to pay the plaintiff £10 in discharge of all claims for damages or compensation, the costs of the arbitrators, and also to pay the costs of the plaintiff as between solicitor and client. The defendants alleged that the award was bad, for while purporting to be an award under the Public Health Act, 1875, as to arbitration, it awarded the plaintiff compensation in respect of matters which were not the subject of compensation under the Act—namely, in respect of facts, matters, and things intended to be done, but never in fact done, by the defendants. The works had never been executed, and the arbitrators had no jurisdiction to make an award at all. The plaintiff showed that she had by the receipt of the notice incurred, with the costs of the arbitration, a loss of about £250, and she contended that she was, by the Public Health Act, 1875, entitled to be compensated for this loss by the defendants. Mr. Justice Ridley held that the award was bad, that the plaintiff was not entitled to the £10 awarded for damage or injury, nor could the plaintiff recover her costs under the award. Mr. Justice Channell agreed on the first but not on the second point, but, as he was the junior judge, he withdrew his judgment. The plaintiff thereupon brought this appeal. Lord Justice A. L. Smith, in giving judgment, said it was on the assumption that the work would be executed that the matter went to arbitration. As the sum of £10 so awarded could not be recovered, because the work had never been begun and had been abandoned, the part of the award dealing with the costs must go by the board also. Lord Justice Collins concurred. Lord Justice Romer said he agreed; but he desired to point out that the Act gave the landowner power to go to arbitration, and get compensation, if the landowner could show that damage had ensued by reason of the receipt of the notice of intended works. Lord Justice A. L. Smith concurred in the view expressed by Lord Justice Romer, that the plaintiff had a right to seek compensation still for loss arising from the service of the notice. Lord Justice Collins agreed. In the result, therefore, the plaintiff's appeal was dismissed, the Lords Justices supporting Mr. Justice Ridley's view that this award of the arbitrators appointed on the assumption of the work being executed was wholly invalid and could not be enforced.

**ANOTHER WORKMEN'S COMPENSATION ACT APPEAL.**—HODDINOTT V. NEWTON, CHAMBERS, AND CO. (LIMITED).—This case was first heard in the Court of Appeal on Saturday by Lords Justices A. L. Smith, Collins, and Romer, and was the employers' appeal from an award made by Judge Lushington, sitting as arbitrator under the Workmen's Compensation Act, whereby the workman received £243 as compensation. Mr. Bray, Q.C., in support of an appeal, said the workman had originally sought compensation for injury he sustained while engaged on a temporary erection, fixing some iron stays in a stable which had recently been built for the London General Omnibus Company. The grounds of the appeal were that the workman at the time was not engaged either "in repairing or constructing a building," nor was the building "thirty feet high." The question turned upon the actual "height of the building," and the level from which this height should be extended, and in the end the hearing was adjourned pending a production of a model of the stables.

**A SLATING CONTRACT.**—BROADBENT AND CO. V. SAUNDERS AND CO.—This action, tried by Mr. Justice Day on Saturday, was brought to recover £50 for work done and goods supplied upon a contract dated July 26, 1898. The defendants had a contract with the Admiralty for the erection of a new coastguard station in the Isle of Grain, Kent. They requested the plaintiffs to give a quotation "for about 80 squares of slating, to be used in the erection of a new coastguard station, Isle of Grain." The plaintiffs quoted 38s., and the defendants accepted. On October 27, 1898, the terms of payment were fixed by memorandum, signed in the name of the defendant firm, as follows:—"Oct. 27, 1898. In consideration of Broadbent and Co. doing the slating at Isle of Grain, I undertake to pay £50 when slates are delivered, £50 when the job is half-done, £50 when the job is completed," and the balance to be paid by acceptance. The present claim was for the second £50, the plaintiffs alleging that more than 40 squares of slating had been done, and that 32 squares only remained for completion. Mr. Lewis, for the defendants, contended that the contract was to execute the slating upon the specific works, and that the reference to "about 80 squares" in the correspondence was only an estimate of the probable amount of slating required, and was intended as a minimum upon which to enable the plaintiffs to give a quotation. The contract was not limited to 80 squares, and, as a fact, 113 squares

would be involved in the completion of the contract, and until half this work had been done the defendants' liability had not arisen. The defendant, Mr. Saunders, and his foreman gave evidence that less than 40 squares had, in fact, been executed; but the latter in cross-examination admitted that he had signed and given a memorandum to the plaintiffs that 41½ squares had been done, and that 24 squares only remained for completion. Mr. Justice Day said that there must be judgment for the plaintiffs. Judgment accordingly.

**IN RE ROBERT GOOCH, OF SOUTHELD.**—A meeting of the creditors of Robert Gooch, builder and contractor, Southend-on-Sea, was held at the London Bankruptcy-court, on Thursday in last week, the Official Receiver, Mr. Cecil Mercer, presiding. The statement of affairs showed gross liabilities £4,792 0s. 7d., of which £2,418 3s. 6d. is estimated to rank for dividend. There are fully-secured creditors to the extent of £2,227 17s. 3d., partly-secured creditors £120, and creditors for rent, wages, and taxes, payable in full, £131 9s. 10d. The net assets are estimated at £648 10s. 3d., and show a deficiency of £2,418 3s. 6d. The debtor commenced business as a builder in Southend about ten years ago, with a capital of £60. During the last few years he has done certain contract work, and estimates he has lost over £1,000 in connection therewith. He was treasurer of the Loyal Cliff Town Oddfellows' Lodge, and the Society is returned as a creditor for £73 12s. 6d. The debtor attributes his insolvency to losses on contracts. The debtor stated that he had no offer to make, and resolutions were passed for adjudication in bankruptcy.

**A PORTLAND ARBITRATION CASE.**—In this case, remitted from the Court of Queen's Bench, the plaintiff was Mr. Robert Comben, of the Albert Inn, Weston, a lime burner and hauler, and the defendants, Arthur May and Co., builders and contractors, of London. The claim was for £87 19s. 6d. for work done and goods supplied. The defendants counter-claimed £150 for breach of contract, alleging that plaintiff had failed to carry out the terms of his contract with them dated 4th August, 1897, whereby he undertook to haul all the materials which they required for the building of six houses upon St. Martin's Estate, Portland, for the sum of £25 per house, payable by four equal instalments, the first to become due when the first-floor joints were up. The plaintiff's denial to the counter-claim was that the defendants had committed a breach of the contract by refusing to pay him the first instalment when it became due, and that he was therefore entitled to rescind the contract and sue on the quantum meruit for the work actually done and the goods supplied by him. The case was referred to Mr. Verey, one of the official referees of the High Court, for trial, and was partly heard by him at the Victoria Hotel, Portland, and then adjourned to the Guildhall, Weymouth. After a lengthy hearing, the Official Referee found the defendants had committed a breach of the contract by not paying plaintiff when the money was due, and he was therefore entitled to rescind the contract and he paid for the full amount claimed, less the sum of £5 16s. paid by the defendants for water during the time he was doing their work, and a further sum of £1 13s. 9d. overcharge for lime supplied to them at the rate of 2s. 6d. per ton, and 12s. charged for hauling water, leaving the total sum of £79 17s. 9d. due to the plaintiff, for which sum the Referee gave judgment with costs.

An "Old Blue" has forwarded a cheque for £1,500 to the treasurer, through the architects (Messrs. Aston Webb and Ingress Bell), to defray the cost of providing an organ for the chapel in the new Christ's Hospital School buildings at Horsham.

Mr. J. Boyd Harvey, managing director of North's Navigation Collieries, opened Colonel North's memorial hall and library at Maesteg last week. The first floor consists of a reading-room, committee-room, and reference-room, and on the second floor are a billiard-room, a bagatelle-room, and a public hall. The builders were Messrs. Rattray and Jenkins, and the architect was Mr. Burnett, Tondu.

Mr. G. F. Watts, R.A., has offered to erect entirely at his own expense a covered way in the churchyard of St. Botolph, Aldersgate, in which to place tablets illustrating heroism in everyday life; while Mr. Sigismund Goetz has offered his figure of the Dead Christ, exhibited last year at the Royal Academy under the title of "Eloquent Silence," for the decoration of the church at the east end. Two other paintings will represent the motto "Watch and pray." The vestry has resolved to apply for the necessary faculty.

In the case of George Rowe Rowe and Rowe Henry Rowe (carrying on business as Rowe Brothers), Wellington-street, Camden Town, N.W., builders and contractors, the order of discharge from bankruptcy has been suspended for two years ending Jan. 31, 1901.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 3fr. 80c.). To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

## NOTICE.

Bound copies of Vol. LXXV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXI., XXXII., XXXIII., XXXIV., XXXIX., XL., XLIV., XLV., XLVI., XLIX., LI., LII., LIV., LV., LIX., LX., LXI., LXII., LXIV., LXV., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., and LXXV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

## GOOD FRIDAY.

NEXT week the BUILDING NEWS will be published on THURSDAY. All Advertisements for the next issue, therefore, must reach the Office by THREE p.m. on WEDNESDAY NEXT, instead of on Thursday as usual.

J. W. R.—(Batesford, 94, High Holborn, will recommend you a good book on quantities. Nothing better on "Model Specifications" can be had than our own series of articles just completed.)

RECEIVED.—A. B. and Co.—E. G.—C. R.—F. G.—A. N.—R. F. (Salop).—J. M. and Co.

## THE MILLBANK COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—It is not pleasant work for me to criticise adversely the doings of the London County Council; but in asking you to publish the inclosed letter, which I have addressed to each of the competitors (save three, whose addresses I could not find nor get from the L.C.C.) in the above competition, and the replies thereto; it is but right to point out that the action of the Housing Committee in the matter of the Millbank estate is, to say the least, strange.

Let us note how the matter stands. There is the vacant land. The people are sore pressed for want of room. The architect's department of housing is overwhelmed with work. What does the Housing Committee do? It resolves on a competition, by which means it may or may not have fondly thought to get some new ideas as to, and assistance in, the designing of workmen's dwellings from outside architects. Having got the idea of outside help into its head, the Housing

Committee, like Mr. Dick, failed to get rid of it; but it, in process of time, however, managed to dilute the idea, and to so attenuate it that its head became again practically empty. This was the mode. A snail's pace was to be adopted. Now mark the following dates:—

Feb. 2nd, 1897.—The Council authorises the Housing Committee to advertise for outside architects willing to design dwellings.

Nov. 16, 1897.—After a delay of nine months, particulars of the competition were approved, and the advertisement authorised above inserted in the papers.

July 12, 1898, eight months later, the Housing Committee reported as follows:—

"In reply [to the advertisement] some seventy architects have intimated their willingness to submit competitive designs, and from these we have made a careful selection." Then followed the names of 18 architects or "firms," as the report calls them, one or two of whom since withdrew.

Aug. 5, 1898.—The particulars, which had been drawn up eleven months before, were sent to the competitors selected.

Nov. 1, 1898.—The plans were delivered.

March 14, 1899.—After four months and a half the meagre announcement was made by the Housing Committee that the sum of £300, which the particulars said was to be divided among "the competitors," was to be divided among five only; moreover, the Housing Committee in entirely ignoring the existence of the twelve other competitors, made it appear that but five had responded by sending in plans.

Besides all this, no publication was to be made of the assessor's report, and no exhibition of the plans, and, further, the report of the Housing Committee, meagre as it was, expressed a doubt as to whether any of the plans were usable.

The matter was, apparently, to be closed up. Some £500 were to be spent, the public were to receive no benefit whatsoever, and the labour and expense which eleven or twelve "carefully selected" architects had been put to, under the express condition that they were to receive some payment, were to be wasted.

This matter, certainly, is one for grave inquiry. Two years and nearly two months have slipped by since the Council resolved to advertise for outside help. Nothing has come of it. It is true that some 70 architects were ready to render assistance, and although there is great delay in the Council's housing schemes, the Council does not adopt the healthy procedure of putting some of its work into the hands of capable outside architects; it prefers, on the contrary, to further crowd the architect's department by employing further temporary assistance, and to which end it voted, last week, £50 per week for assistants and £11 11s. for clerks of the works.

Allusion is made in my circular to the lowering of the Council's health code in the matter of light, air, and space. This is a most wanton flouting of the hygienic knowledge which the medical and other officers of the Council possess; and this retrograde step was decided upon while the competition was *sub-judice*, and it was after the plans were in that the Housing Committee approved of that which I call, because of the smallness of the rooms, the plan of a modern slum, with regard to which I want to ask a question, and would like the Housing Committee to answer. Were the five designs which were sent to the Council's officers compared with a plan recently prepared in the Housing Department, and was this comparison reported to the Housing Committee?

The attention of the people of London should be drawn to this unwarrantable setting aside of sanitary laws by the Council's deliberate action.

There is no question in my mind but that the crowded plans which the Council are now preparing are a deliberate step backwards, and it is a step in the dark and a deliberate breach of good faith with the competitors who had a larger size of room given to them than was since adopted by the Housing Committee. Had I known personally that the Council desired other than a healthily designed building, I would not have wasted any time and money in competing.

But it is the people to be housed who will suffer—the people who pay rents, whereby, as in the Bethnal Green scheme, some 9 per cent. is made by charges and interest on the capital expended, and these are the people who have no voice in the matter. Beside these, that fearsome bogey of both official and councillor—the ratepayer—will suffer, because the people are being

educated very fast that a workhouse or an asylum is a far more airy and salubrious place than cramped block dwellings such as the Council are about to erect on the Millbank estate.—I am, &c.,

ROBERT WILLIAMS.

## COPY OF CIRCULAR SENT TO COMPETITORS.

(Will those who may not have had a copy please take this as one?)

20, Northbrook-road, Lee, London, S.E.

## THE MILLBANK COMPETITION.

DEAR SIR,—As one of the competitors in the above, may I ask you to join with me in petitioning the London County Council to—

1. Exhibit the designs.
2. Publish the assessor's report.
3. Publish the report of the "officers of the Council."
4. Request the assessor to reconsider the division of the £300, in accordance with the conditions which state that—

"A sum not exceeding £300 will be awarded among the competitors in such proportions as the assessor may determine."

I may say that I have written to the clerk, L.C.C., on these points, and have seen several members, who agree that this thing should not be hid in a corner.

I have also seen Mr. Blashill, who promised to use his endeavours to get the designs exhibited.

It is highly important that the public should see the designs for the purpose of criticism and comparison. There are reasons for believing that a low canon of hygiene has, since the publication of the conditions and the delivery of the plans, been adopted by the L.C.C.; whether that has influenced the decision in the selection I cannot tell. But it is a fact that on November 22nd (the plans being in on November 1st), the council approved of plans for the Millbank estate, showing living-rooms of 147 and bedrooms of 100sq.ft. respectively, while the average of those required by the conditions was to be 160 and 120 respectively.

Personally, I am quite willing to abide by the assessor's selection for the first five; but having entered this competition (a) with the understanding that it was to be a paid one, and (b) that I should, being a writer on the subject of "Housing," be able to compare my own idea of a sufficiency of light, air, and space in and about a block dwelling with those of others, I feel confident that you will assist in making the whole of this matter public.

Kindly reply as soon as possible, informing me if I may have your name to append to the petition referred to above.—Yours faithfully,

ROBERT WILLIAMS.

## EXTRACTS FROM LETTERS RECEIVED FROM COMPETITORS IN REPLY TO THE FOREGOING CIRCULAR.

Mr. H. W. Dodd (premiated).—"I shall be pleased to sign a petition to the L.C.C., asking them to exhibit the designs, &c."

Messrs. Gibson and Russell (premiated).—"Willing to sign the first three heads of your petition. As for the fourth, we do not see that you can read into the condition that each competitor is to receive a share of the £300."

Joseph, Son, and Simons (premiated).—"We believe the designs are to be exhibited, and do not think it necessary to petition the L.C.C."

Spalding and Cross (premiated).—"We cannot support you in petitioning the London County Council in the way you suggest; but we shall be glad to hear that the designs are to be exhibited to the public, and that the assessor's report is to be published."

Mr. Francis Hooper (not premiaded).—"I had previously written to the clerk for a copy of the assessor's report, and will, with pleasure, write as to the exhibition of the designs."

Messrs. Waring and Nicholson (not premiaded).—"We are quite with you as to the plans being exhibited, if only to ascertain the points of excellency that have decided the award for future guidance, and we have already asked, and been informed at the office of the London County Council, that such is their intention."

"With regard to your other points, we do not consider any good would result from petitioning the London County Council. The most effectual course would be to ask a member to raise the question in the Council itself."

Mr. Geo. S. Hill.—"I am in receipt of your communication regarding above competition, and am quite at one with you on the points of the conditions that each competitor would receive some remuneration for his trouble in the matter, and the exhibition of the designs and publication of the reports are very desirable. In thanking you for taking up this matter, I have pleasure in allowing you to append my name to the petition."

Mr. Seth-Smith.—Although selected, Mr. Seth-Smith did not compete.

NOTE.—The L.C.C. had no intention of exhibiting the designs or doing anything more than quietly burying this matter until I called on Tuesday the 14th. The letter of the clerk, intimating the decision of the assessor, had the following words:—"Your plans will be forwarded to you in due course," not a word about exhibiting.

A word as to Mr. Dodd, the only premiaded competitor who is altogether at one with myself. As one who refused a premium in an important public work because of unfairness to others, I glory in finding another of the many yet in the Israel of architecture who have not bowed the knee to Baal. If Mr. Dodd continues, he will die a poor man; but a few will die with him, and they will be genial companions.—R. W.

[Since this letter was in type, Mr. Williams has sent us several more letters from architects who have replied to him, for which we really have not room. We certainly think some action is desirable, and that some explanation by the L.C.C. is due to the architects who competed.—Ed.]

The extension to Padstow of the North Cornwall Railway was formally opened yesterday (Thursday).

## Intercommunication.

### QUESTIONS.

[12215.]—**Right to Pull Down and Rebuild Wall Dividing Two Properties.**—A and B own properties, both being freehold. The two properties are divided by a 14in. wall, which is on A's land, and a few years ago was A's exclusive property. A subsequently made an agreement with B, whereby B becomes entitled to the full use of the wall for a limited height only. A now desires to pull down and rebuild the 14in. wall dividing the properties, but B resents any interference with the wall so far as it interferes with his property, which is on lease to a banking firm for a term of years. Can A pull down and rebuild the wall? How should A proceed to do this? And what are his responsibilities in the matter?—LANCASTRIAN.

### REPLIES.

[12210.]—**Scraping Stonework and Marble.**—The stone may be rubbed down. As for the marble, it is better left, as any removal of the skin may be injurious. I am not aware of any wash that would remove the stains.—A. D.

[12212.]—**Excavating Trenches for Drains.**—I should say approximately 6d. per cube yard; but, of course, it will depend on the kind of soil, and the portion to be filled in.—FER CUBE.

[12213.]—**Greenhouses.**—I should write to a builder of greenhouses, and ask him for a price. Apply to Messenger and Co., Ltd., Loughborough, or 98, Victoria-street, Westminster, sending dimensions, &c. I should say, roughly, a lean-to house of the size required, would cost about £20 to £23. The heating apparatus being extra.—G. H. G.

## WATER SUPPLY AND SANITARY MATTERS.

**SOUTHPORT.**—Mr. James Mansergh, C.E., has submitted an important report to the Southport Corporation in reference to the sewage disposal of the borough. In a previous report Mr. Mansergh set out a scheme of chemical precipitation, but at the same time called attention to the bacterial methods of sewage treatment. After an investigation into the present position and development of the bacterial process in England, Mr. Mansergh now states that he has no hesitation in recommending it to the Southport Corporation for adoption. The treatment he advises is that known as Mr. Diben's. The total cost, with a pumping plant at the Crossens outfall, in addition to the bacterial process, with five beds, is estimated at £54,000, and annual working expenses £825. Omitting the five beds, and the cost is given at £35,000 and annual working expenses £775. The cost of the scheme of chemical precipitation was estimated at a capital expenditure of £32,200, and the working expenses at £2,240 per annum. The sewerage committee, who have dealt with the report, states that whilst it regards with favour the bacteriological process of sewage treatment, it does not feel warranted in recommending the council to adopt the system until an opportunity has been afforded of seeing it in operation on a large scale.

**LEEDS.**—Some successful experiments are being carried out at the Leeds sewage works at Klostrop with regard to the treatment of sewage by the bacteriological process. On Saturday the Manchester Sewerage Committee visited Klostrop to see the system in operation, and the Royal Commission on Sewage will, at a later date, inspect the works. At the last meeting of the Sewerage Committee the Lord Mayor reported that the three pairs of new bacteria beds are working satisfactory, under the superintendence of Mr. Cameron, of Exeter; a septic tank is being constructed, and during the present week the committee have commenced some new experiments with open septic tanks, and also with beds constructed so as to give continuous supply and continuous aeration.

Mr. Herbert Steward, Assoc. Am. Soc. C.E., one of the leading New York contractors, died in that city on March 5. He was engaged on the construction of many notable works, including the Sixth Avenue elevated line in New York, the Washington arch bridge over the Harlem River, and the 155th-street viaduct.

The Devonport Town Council resolved, on Friday to acquire a site of about seven acres of land, upon which to erect an infectious diseases hospital, and a committee were asked to consider the advisability of disposing of a field adjoining the technical schools, which was purchased primarily for the purpose of building thereon municipal offices.

In order to facilitate the archaeological discoveries made during the excavations now being carried on in the Forum under the auspices of the Italian Government, Mr. Lionel Phillips, the South African financier, has contributed £2,500, the estimated cost of expropriating the houses now standing above the ruins of the Basilica. These houses have hitherto constituted an insuperable obstacle to the excavation of that most important archaeological site.

## Our Office Table.

THE District Surveyors' Association have presented a petition to Parliament against the provisions of the London Local Government Bill, pointing out that the official, personal, and private rights and interests of their members, as well as their ability to discharge their duties in administering the London Building Act, 1894, will be very materially and prejudicially affected if the Bill becomes law in its present form. There are, they mention, at the present time 65 districts in London each under the control of a district surveyor, who is virtually an independent statutory officer; but there is an appeal against his requirements under the Building Act to a metropolitan magistrate upon points of law and fact and to the Tribunal of Appeal constituted by the Act upon matters of discretion. By Clause 5 of the Bill it is *inter alia* proposed to authorise the transfer from the London County Council to the borough councils to be formed by the Bill such powers as may be agreed upon between the respective councils, and by Clause 6 it is also proposed to give power to the Privy Council to determine "which of the powers under the London Building Act, 1894, or any amending Act, other than the powers mentioned in Part I. of the second schedule to this Act, are to be exercised by the London County Council and the borough councils respectively, and the conditions under which they are to be exercised." The petitioners strongly object to the powers sought to be conferred on the borough councils by the above clauses in the Bill, and they submit that if the same are sanctioned they would constitute a serious hindrance to the district surveyors in the conscientious discharge of their duties and a danger to the public interest. The transference of any of the provisions of the Building Act to the control of the borough councils would not, they consider, be for the public benefit, as the district surveyors would no longer be able to discharge their duties fearlessly and impartially, while uniformity of administration would be destroyed. They ask that Clause 5 should be struck out of the Bill, and Clause 6 either amended or also omitted from the Bill.

THE remains of St. Cuthbert experienced many vicissitudes before they found a resting-place beneath the magnificent shrine of the great Cathedral of Durham. From Lindisfarne, where the body of the saint was first deposited, the monks, under stress of Danish invasion, carried it to many places before Durham was finally reached. When, in 1104, the body was transferred from the older to the new church built by Bishop William, the curiosity of the monks led them to open the coffin, which also contained the head of King Oswald, slain in 642, and other relics. In 1542 the magnificent shrine was defaced, and the body buried beneath the floor of the church. In May, 1827, the tomb was opened and the bones of the saint were found, and with them St. Oswald's head. The tomb has recently been opened once more under the supervision of the dean, Canon Fowler, and Dr. Greenwell. They found the coffin entirely rotten. With the bones presumed to be those of the saint were found many others, possibly relics of other saints, including those of a child. A portion of what may have been the skull of St. Oswald was also there, with a part of the forehead sliced off as with the stroke of a sword. In the account of the examination, we are told: "The complete skeleton is that of a man of fifty (which was the age of St. Cuthbert), and of good height and strength. The skull is by no means of the low, unintellectual type given in Raine's representation of it, but is well balanced, with a slightly receding forehead." It is intended to place the relics in a new oak coffin.

It is announced that a syndicate has been formed in the Vermont slate district, in the United States, with a view of increasing the export of slate to Europe and of controlling the prices. The syndicate has already taken over eight of the best quarries in the Poultney district, and is managed entirely by practical Welshmen. They have acquired already the best quality sea-green and mammoth vein slates, and are preparing to export 7000 "squares" per month. Since the breakdown of the Sea-green Trust some months ago, the competition between Welsh and American slates has not been so keen, and the shipments at Carnarvon are now greater than ever they were, in spite of the fact that last

year the value of American slate exported exceeded by \$41,000 that of 1897, and that the price of American slate in this country is 9s. per 1000 cheaper than the best Welsh qualities.

GRAVEL roads are commended for light travel in the annual report of Mr. James H. MacDonald, commissioner of highways of Connecticut, who says: "A mistaken idea prevails to some extent that to make a perfect system of roads throughout the State, a macadam system must be inaugurated. This is not of necessity so, as I have seen many miles of roads in different towns in the State of splendid natural gravel roads. What I mean by natural gravel roads is that the roads have been laid out through territory of gravel formation. All that was necessary in the improvement of the road was to open up the road without the addition of any other material than was found on the road itself. These roads could be made first-class roads by widening out and shaping the road and forming gutters, thus making them first-class roads with very little expense."

## MEETINGS FOR THE ENSUING WEEK.

**SATURDAY (TO-MORROW).**—Edinburgh Architectural Association. Visits to Houses, Morton-hall-road and Grange House. 2.25 p.m.

**TUESDAY.**—Institution of Civil Engineers. "Alloys of Iron and Nickel," by Robert Abbot Haddfield, M.Inst.C.E. 8 p.m.

**GOOD FRIDAY.**—Glasgow Architectural Craftsmen's Society. "Architect v. Contractor," by J. Lockhead; and "The Public and Architecture," by C. E. Monro. 8 p.m.

## CHIPS.

Business at the Estate Mart last week, although most unpromising on the opening days, was conspicuous by the successful negotiation of two important sales, one being that of an entire Adventurer's Share in the New River Company, which realised £112,500, and the other a complete disposal of the third portion of the Angerstein ground-rents. Metropolitan house property continues to furnish the bulk of the operations. Provincial doings are much quieter than was apparent last year. The totals on the week were £296,827.

A Local Government inquiry was held on Friday at the Municipal Buildings, Middlesbrough, by Mr. A. E. Meade-King, M.I.C.E., respecting an application of the Middlesbrough Corporation to borrow £36,000 for electric lighting purposes. Mr. R. Hammond, consulting engineer, said that his experience was that in nearly every case where corporations had commenced electric-light works they had proved successful.

At the age of 84 years, the death took place on Thursday, in last week, at 15, North-road, Chapham-park, S.W., of Mr. Thomas Loyd, who for many years carried on business at 32, Nicholas-lane, Lombard-street, E.C., as a plumber and decorator. Mr. Loyd had served on two occasions the office of master of the Glaziers' Company, an at the time of his death was the father of that guild.

The Scottish Court of Sessions considered on Friday a report by Mr. Dick Peddie, architect, Edinburgh, on the buildings which have been erected for the Callander and Trossachs Hydropathic Company, in connection with an action against them by Wm. H. Marshall, W.S., Edinburgh. Mr. Dick Peddie reported that the buildings were of the structural value of £15,000, and had been erected to his satisfaction. The Court approved of the report, absolved the defenders from the conclusions for damages, found the defenders liable in the expenses of the reporter's fee, and quoad ultra found no expenses due.

Alexander Lumsden (30), builder and contractor, of the firm of Lumsden Brothers, 19, Bellfield-street, Glasgow, met with a fatal accident on Saturday at a building in course of construction by his firm in East Nelson-street, Glasgow. While Mr. Lumsden was letting himself down from the top of the new building by a hoist used for raising building materials and worked by a pulley and ropes, the hoist struck a beam, tilted over, and threw out Mr. Lumsden, who was instantaneously killed.

The Cromer Protection Bill for the extension of the sea-wall and the erection of a pier at Cromer at an estimated cost of £46,000 has passed its third reading in the House of Lords. The engineer of the scheme is Mr. Douglas, C.E.

New business premises in Houndsditch and Stoney-lane were formally opened on Thursday in last week. They have been built, from designs by Mr. Benjamin Tabberer, by Messrs. Patman and Fotheringham.

The corporation of Newcastle-upon-Tyne have adopted plans by Mr. W. G. Laws, the borough engineer, for alterations to the meat and provision markets, including a new roof, and estimated to cost about £7,000.

## Trade News.

## WAGES MOVEMENTS.

**ARBROATH.**—The operative painters in Arbroath having applied for an increase of wages at the rate of 1d. per hour, the local branch of the Master Painters' Association of Scotland has unanimously resolved to refuse the advance, as the state of the building trades in the district does not warrant it.

**BROUGHTY FERRY.**—After consideration, the operative joiners have agreed to accept the offer made by the employers of a rise of 1d. per hour on their wages. Their acceptance of the compromise settles the dispute.

**CARNARVON.**—All the journeymen employed by the master painters at Carnarvon struck work on Monday, demanding more money and less hours. They claim an increase of 1½d. per hour in their wages.

**HAWICK.**—A meeting of the Border Counties Master Painters' Association was held at Newtown St. Boswells on Saturday afternoon, when the requests of the Hawick operatives were considered. The first, that the wages should be increased from 7½d. to 8d. per hour, commencing on April 1 next, was granted, on condition that the working day be reduced to one of nine hours. The demand that overtime be paid at the rate of time and quarter was also granted generally; and to other points, that labourers ought not to do painters' work, and that the number of apprentices should be reduced, it was decided to reply that both these could be regulated by the men.

**HULL.**—The master joiners have resolved: "That the joiners' application for an advance of one half-penny per hour be not considered until a uniform code of working rules has been amicably arrived at." The Master Builders' Association are moving with a view to securing a uniform code of working throughout all branches of the building trade.

**MAIDSTONE.**—On Saturday a demonstration took place at Maidstone, under the auspices of the local branch of the United Builders' Labourers' Union, in favour of a rise in the wages of the labourers of 1d. per hour on the present remuneration of 5½d. A public meeting was subsequently held at the Skating-Rink. Mr. John Potter, J.P., president of the Maidstone and District Trades Council, presided, and was supported by Mr. W. Stevenson (general secretary), Mr. F. Kennedy (organiser of the Union), Mr. A. Field (secretary of the Maidstone and District Trades Council), Mr. E. Cooper (local secretary), and others.

## CHIPS.

The London County Council resolved, on Tuesday, to purchase the freehold of premises in Cockspur-street at a cost of £100,000 to increase the office accommodation. It was stated that the premises would accommodate 140 officials.

The Prince of Wales has consented to lay the undation-stone of the new Post Office Savings Bank building at West Kensington. The ceremony will probably take place in June.

The Technical College and Public Hall, West Hartlepool, has been fitted with improved hot-water heating apparatus by John King, Limited, engineers, Benson-street, Liverpool, employing the new "Rajah" ventilating radiators.

The disused baths in Ferndale-road, Brixton, long a white elephant in the possession of the Vestry of Lambeth, have at last been disposed of by that body to the Technical Education Board, the purchase sum being £4,000 for land and buildings—just one-seventh of the original cost. The buildings, which were at one time opened as a polytechnic, will be converted into a technical school for the building trades.

At the Central School of Arts and Crafts, 316, Regent-street, W., a lecture (with lantern illustrations) on "metal-work" will be given this Friday evening, at 8 p.m., by Mr. J. Starkie Gardner.

A new Post-office is now being erected at Port Elizabeth, South Africa, and special consideration is being given to the ventilation, which will be carried out on the Boyle system.

There seems some probability that that long-delayed project, the rebuilding of the tower of Liskeard Church, will be begun ere long. Several meetings have been held during the last few days, and it has been announced that building operations will commence very shortly. The architect, Mr. John Sansom, is preparing working plans, and when they are ready no time will be lost in obtaining tenders for the work. A sub-committee has been appointed to prepare for the laying of the corner stone.

The name of Edward Locke, of Thornton Heath, architect and surveyor, appears in the list of receiving orders in Tuesday's *Gazette*.

The council of Charing Cross Hospital has appointed Mr. A. Saxon Snell, F.R.I.B.A., architect, in connection with the proposed rearrangement and extension of the hospital.

A case was heard on Friday at the County of London Sessions before Mr. Loveland, Q.C., and a jury, in which Mr. Meakin, lessee of the Elephant and Castle Tavern, Newington Butts, claimed from the County Council compensation for the loss of 1,046ft. of frontage in widening the thoroughfare. The jury awarded the claimant £7,912 compensation and expenses.

Messrs. Wm. Potts and Sons, clock manufacturers, of Newcastle-on-Tyne and Guildford-street, Leeds, have just erected a new turret clock at the Newcastle-on-Tyne infantry barracks for H.M. Government. They are also erecting a new turret clock to show the time on three external dials for Messrs. Swan and Hunter, shipbuilders, Newcastle-on-Tyne.

An important case arising out of the late Colonel North's proposal to build a new suburb at Ostend, to be known as North City, is to come before the Belgian Courts. An architect named Maguet, who was employed by Colonel North to produce the plans, is suing Colonel North's heirs for 80,000 francs for work and compensation. The plans were for buildings to cost 8,000,000 francs, and the claim is at the rate of 2 per cent. Colonel North's heirs are stated to have offered 25,000 francs (or 8 per cent.) in settlement, but this has been refused, and the case is to be heard at Brussels. Well-known counsel have been engaged on both sides.

A Select Committee of the House of Commons yesterday approved the preamble of the Charing Cross, Euston, and Hampstead Electric Railway Bill, which grants an extension of time for the works authorised in 1893, and also sanctions three new railways, bringing the proposed line into direct connection with the South-Eastern at Charing Cross, the North-Western at Euston, and the Midland at Kentish Town. The first engineers are Mr. W. R. Galbraith, C.E., and Sir Douglas Fox; total length of the lines, which will be from 40ft. to 50ft. below the surface level, is 4½ miles, and the estimated cost is £290,000.

At the last meeting of the Wangford Rural District Council, Mr. W. E. Warburton, of Audley, was appointed district road surveyor.

## "SANITAS" DISTEMPER.

A Washable Sanitary Distemper for Whitening and Disinfecting Walls and Ceilings of Passages, Cellars, Stables, Kennels, Sheds, Farm Buildings, Railway Trucks, Horse Boxes, and for General Use.

Huddersfield—Station-street Buildings	.....	Abbey and Hanson, Architects, 20, Ramsden-street, Huddersfield	.....	27
Derwent Cottages—Wesleyan Methodist Church	.....	Geo. Thos. Wilson, 121, Durham-road, Blackhill	.....	27
London, E.—Extension of Infirmary, Bow-road, E.	.....	J. Pridmore, Architect, 2, Broad-street Buildings, E.C.	.....	27
Stockton-on-Tees—Additions to Baths, Portrack-lane	.....	M. H. Sykes, Borough Engineer, Town Hall, Stockton	.....	27
Leadgate—New Out-Offices to Cottages	.....	C. E. Oliver, Architect, General Offices, Blackhill	.....	27
Cardiff—Wesleyan Calvinistic Chapel, Crwys-road	.....	John H. Phillips, Architect, St. John's Chambers, Cardiff	.....	27
Rugby—Iron Buildings in Cattle Market	.....	D. G. Macdonald, Surveyor, Rugby	.....	27
Chopwell—Forty-four Cottages	.....	C. E. Oliver, Architect, General Offices, Blackhill	.....	27
Wombwell—Girls' School, Park-street	.....	Jno. Robinson, Clerk, Park-street, Wombwell	.....	28
Linthwaite—Wesleyan Assembly Hall	.....	John Kirk and Sons, Architects, Huddersfield	.....	28
Poplar, E.—Coroner's Court, Mortuary, &c., High-street	.....	Landsell and Harrison, Architects, 38, Bow-lane, Cheapside, E.C.	.....	28
Combwich—Warehouse	.....	The Secretary, Farmers' Association, Combwich	.....	28
Bridlington Quay—Additions to Haylock House	.....	J. Earnshaw, Architect, Bridlington Quay	.....	28
Glencolumbkille—Extending Parish Church	.....	S. P. Close, Architect, Donegal-square Buildings, Belfast	.....	28
Tow Law—Two Seven-roomed Houses	.....	R. Rowe, Prospect House, Tow Law	.....	28
Coventry—Extension of Electricity Works, Sandy-lane	.....	J. E. Swindlehurst, City Engineer, St. Mary's Hall, Coventry	.....	28
Kingston-on-Thames—Female Infirmary, &c., at Workhouse	.....	W. A. Hope, C.E., Architect, Portsmouth-rd., Kingston-on-Thames	.....	28
Griffithstown—Four Semi-Detached Houses	.....	J. Phillips, 20, Oxford-street, Griffithstown	.....	28
Tooting—Stabling and Cottage at Dust Destructor, Alston-rd.	.....	H. G. Hills, Clerk, East Hill, Wandsworth, S.W.	.....	28
Liverpool—Alterations, Public Washhouses, Burrough's-garden	.....	W. R. Court, Engineer, Cornwallis-street, Liverpool	.....	28
Leeds—Addition of an Apse, Nave Roof, Seating, &c., St. George's Church	.....	H. Walker, Architect, 8, Upper Fountain-street, Leeds	.....	29
Winchmore Hill—Boiler and Engine House	.....	Pennington and Son, Archts., Hastings House, Norfolk-st., Strand	.....	29
Hawthorn—Enlargement of Schools	.....	W. Mortimer and Sons, Architects, Lincoln	.....	29
Torpoint—Repairing Workhouse	.....	Fred. Wm. Cleverton, Clerk, Union House, Torpoint	.....	29
Morecambe—House and Shop, Cross-street	.....	Marshall Bros., Architects, Back Crescent, Morecambe	.....	29
Elgin—Steadings, Easter Manbeen and at Claydales	.....	A. and W. Reid and Wittet, Architects, Elgin	.....	29
Burnt Joyce—House and Sale Shop	.....	R. Whitbread, M.S.A., Architect, Carlton	.....	29
Abergavenny—Semi-detached Villas, Hatherleigh-road	.....	E. A. Johnson, Architect, Abergavenny	.....	29
Whitby—Parish Room, St. Hilda's-terrace	.....	Edward H. Smales, A.R.I.B.A., 5, Flowergate, Whitby	.....	30
Wheatley Hill—Extension and Restoration of Church	.....	James Garry, Architect, 47, Church-street, West Hartlepool	.....	30
Langollen—Two Houses, Princess-street	.....	J. Denny, Architect, Langollen	.....	31
Ipswich—Alterations and Additions to Borough Asylum	.....	E. Buckham, Borough Surveyor, Town Hall, Ipswich	.....	April 1
St. Peter's Port, Guernsey—School Buildings at Amherst	.....	Colson, Farrow, and Nisbett, Archts., 45, Jewry-street, Winchester	.....	1
Englefield Green—Enlarging School, &c.	.....	W. Menzies, Architect, Englefield Green, Surrey	.....	1
Hastings—Stabling at Rock-a-Nore, Vine Farm, St. Helen's, and Silverhill	.....			
Ardrossan—Additions to Academy	.....	P. H. Palmer, M.I.C.E., Borough Engineer, Town Hall, Hastings	.....	3
Cwmaman—Seventeen Houses	.....	John Armour, jun., Architect, Irvine	.....	3
Clifton, Cumberland—Altering and Renovating Parish Church	.....	Llewellyn Smith, Architect, 20, Commercial-street, Aberdare	.....	3
Great Yarmouth—Additions to Northgate School	.....	J. Howes, Architect, Workington	.....	4
Leyton—Public Baths	.....	Bottle and Olley, Architects, Queen-street, Great Yarmouth	.....	4
Rauncy, near Sleaford—Superstructure of Lunatic Asylum	.....	Harrap and Duffield, Architects, 34, Queen-street, E.C.	.....	4
Egremont—Additions to Roman Catholic Schools	.....	G. T. Hine, F.R.I.B.A., Architect, 35, Parliament-street, S.W.	.....	4
Bristol—Rope Factory, Bath-road	.....	J. S. Stout, Architect, Gillfoot, Egremont	.....	5
Halifax—Iron Foundry, Albert-road	.....	Henry Williams, Architect, 24, Clare-street, Bristol	.....	5
Tipton—Ocker Hill Schools	.....	Jackson and Fox, Architects, 7, Rawson-street, Halifax	.....	6
Halwell—Two Cottages	.....	A. Long, Architect, 21, High-street, West Bromwich	.....	6
Ushaw Moor—Wesleyan Premises	.....	Rev. B. Wheel, the Vicarage, Halwell	.....	6
Stroud Green, N.—Branch Public Library	.....	J. Walton Taylor, F.R.I.B.A., Architect, Newcastle-on-Tyne	.....	7
Cornelly—Villa	.....	E. J. Lovegrove, Surveyor, Southwood-lane, Highgate	.....	10
Durham—Technical School	.....	P. J. Thomas, Architect, Bridgend	.....	10
Helsby—Six Cottages	.....	Oliver and Leeson, Architects, Bank Chambers, Newcastle	.....	11
Gateshead—Rebuilding the Foresters' Arms, Askew-road	.....	A. E. Bolter, Secretary, Paddington Station, London	.....	11
Penzance—Buoy Store, &c., Trinity Store	.....	A. G. Kyle, Architect, 145, Pilgrim-street, Newcastle	.....	13
Cardiff—Stable	.....	Chas. A. Kent, Secretary, Trinity House, London, E.C.	.....	17
Chelsea, S.W.—Two Bath Turrets at Infirmary, Cale-street	.....	G. K. Mills, Secretary, Paddington Station, London	.....	18
Silloth—Stable, Byres, &c., at Wolsty Hall	.....	Landsell and Harrison, Archts., 38, Bow-lane, Cheapside, E.C.	.....	18
Morecambe—Villa, Stabling, &c.	.....	P. and J. W. Hayton, Surveyors, Bank-street, Carlisle	.....	—
Belfast—Dwelling-houses, Brown's-square and Gardiner-street	.....	Marshall Bros., Architects, Back Crescent, Morecambe	.....	—
Osley—Rebuilding Black Horse Hotel	.....	W. J. Moore, Architect, Whitehall Buildings, Ann-street, Belfast	.....	—
St. Mellon's—Three Cottages	.....	H. Chippendale, Architect, Springfield, Guiseley	.....	—
Colchester—House, Rawstorn-road	.....	David Oaklands, St. Mellon's, Mon.	.....	—
Ashton-under-Lyne—Fourteen Cottages	.....	C. E. Butcher, Architect, 3, Queen-street, Colchester	.....	—
Morecambe—Two Semi-Detached Houses, Rosendale-avenue	.....	T. George and Sons, Architects, Old-square, Ashton-under-Lyne	.....	—
South Acton, W.—Laundry Premises	.....	Marshall Bros., Architects, Back Crescent, Morecambe	.....	—
Lurgan—Grocery Premises, Market-street	.....	G. P. Pratt, A.R.I.B.A., 10, The Parade, Churchfield-road, Acton	.....	—
Frinton-on-Sea—Small House	.....	W. J. Moore, Architect, Ann-street, Belfast	.....	—
Cardiff—Additions to 1, Adam-street	.....	Beresford Pite, F.R.I.B.A., 48, Harley-street, W.	.....	—
Kidderminster—Two Shops and Houses, New-road	.....	J. P. Jones, Richards, and Budgen, 18, St. Mary-street, Cardiff	.....	—
	.....	J. M. Gething, Architect, Oxford Chambers, Kidderminster	.....	—

## BUILDINGS—continued.

Morecambe—House and Shop, Sefton-road.....	J. Stutton .....	Marshall Bros., Architects, Back Crescent, Morecambe .....
Cardiff—Church.....	Frederick R. Kempson, F.R.I.B.A., Hereford .....	
Bulmer, Sudbury—Building Fox Inn .....	C. E. Maulden .....	John Shewell Corder, Architect, Wimbourne House, Ipswich .....
Stapleford—Primitive Methodist Chapel and School.....	Goole Steam Laundry Co. ....	Hy. Harper, Architect, 8, Beasmarket Hill, Nottingham .....
Goole—Alterations to Building in Victoria-street .....	R. Hastewell .....	J. Roberts, Clarkson's Hotel, Goole .....
Morecambe—Alterations to 22, The Crescent .....	G. R. Burnett .....	P. B. Rigg, Architect, Market-street, Morecambe .....
Haltwhistle—Dwelling-House .....	Aldrich and Co., Limited .....	H. Higginson, M.S.A., Carlisle .....
Ackworth—Two Stone Houses .....	A. Wenlock .....	Walter E. Richardson, Architect, 28, Bond-street, Leeds .....
Seascale—Preparatory School .....	School Board .....	W. Mason and Son, Architects, Ambleside .....
Bermordsey, S.E.—Factory .....	J. Abraham .....	Wm. Freeman, Surveyor, 162 Kennington-road, S.E. ....
Disa—Warehouse and Offices .....	Ed. Woodward .....	J. Shewell Corder, Architect, Wimbourne House, Ipswich .....
Bradford—Porch, Seating, &c., at Park Chapel, New Cross-st. ....	Halstead Co-operative Society .....	Saml. W. Pitchers, 14, Grantham-place, Bradford .....
Brightlingsea—House and Shop, High-street .....	Jas. Campbell .....	Chas. E. Butcher, Architect, 3, Queen-street, Colchester .....
Aberfan—Pair of Semi-Detached Cottages .....	Managers .....	William Dowdeswell, Architect, Treharris .....
Long Eaton—Schools and Swimming-Bath .....	Waterloo Co-operative Society .....	E. R. Ridgway, Architect, Long Eaton .....
Nacton—Additions to Rectory .....	Pragnell and Co. ....	J. Shewell Corder, Architect, Wimbourne House, Ipswich .....
Clevedon—House and Shop, Kenn-road .....	School Board .....	C. R. Middle, Clevedon .....
Pudsey—Five Small Through Houses, Somerset-road .....	Port Talbot Development Co. ....	George D. Goforth, Richardshaw-lane, Pudsey .....
Hanley—Shop Premises and House, Keeling's-lane, Northwood .....	School Board .....	A. P. Miller, Architect, Frederick-street, Hanley .....
Ballynahinch—Business Premises .....	Industrial Co-operative Society .....	H. M. Reid, C.E., Ballynahinch, Ireland .....
Halstead, Essex—Four Pairs of Cottages .....	Jas. Young and Co., Architects, 62, Market-street, Bradford .....	Goodey and Cressall, Architects, 2, Victoria Chambers, Colchester ..
Stonham Pawa—House .....	S. H. Jackson .....	Walter Durrant, Hermon Lodge, Felixstowe .....
Belfast—Two Shops and Three Houses, Old Park-road .....	Trustees .....	W. J. Moore, Architect, Ann-street, Belfast .....
Ipswich—Shop Front and Alterations to Premises, Westgate-st. ....	Valentine Harrison .....	Thos. Wm. Cotman, Architect, Northgate-street, Ipswich .....
Wolverhampton—Schools, Gatis-street .....	Waterworks Company .....	F. Hunter Lynes, A.R.I.B.A., Gresham Chambers, Wolverhampton ..
Dudley—Temperance Institute .....	Sanitary Authority .....	Wood and Kendrick, Architects, West Bromwich .....
Littlemoss, Ashton—Branch Store .....	Waterworks Committee .....	A. J. Howcroft, Architect, 12, Clegg-street, Oldham .....
Allerton—Villa Residence, Chellow Dean .....	Thrapston Rural District Council .....	J. W. C. Atkinson, Architect, 1, Ivagate, Bradford .....
Thornham—Repairing Nave Roof of Church .....	Corporation .....	The Vicar, Thornham, Norfolk .....
Bristol—Additions to Premises, Broadmead .....	Rural District Council .....	James Hart, Corn-street, Bristol .....
Shipley—Combining Shed .....	Urban District Council .....	John Jackson, M.S.A., Barry-street, Bradford .....
Dewsbury—Glassworks, Savile Town .....	Electric Lighting Committee .....	J. Judson and Moore, Architects, York Chambers, Keighley .....
Port Talbot—Fifty Cottages .....	Corporation .....	David C. Salmond, Architect, 7, Windsor-place, Cardiff .....
Bradford—Alterations to Premises, Leeds-road .....	Urban District Council .....	Empsall and Clarkson, Architects, 7, Exchange, Bradford .....
Wrexham—Central Stores, Bridge-street .....	Corporation .....	Morrison and Son, Architects, King-street, Wrexham .....
South Uist—Additions to Eriakay School .....	Corporation .....	J. Wedderspoon, C.E., Inverness .....
Baslow—Enlarging Cottage .....	Corporation .....	W. Cecil Jackson, M.S.A., 29, Knifesmithgate, Chesterfield .....
Allerton—Four Houses and House and Shop, Prospect-terrace .....	Corporation .....	R. Drake, Architect, 142, Allerton-road, Allerton .....
Southend-on-Sea—Tower Boarding House, Beach-road .....	Corporation .....	W. Y. Hobbiss, Architect, 57, High-street, Southend-on-Sea .....
Derby—Seven Cottages, Nottingham-road .....	Corporation .....	E. R. Ridgway, Architect, Long Eaton .....
Coxhoe—Assembly Hall .....	Corporation .....	C. A. Todd, Clarence Villa Hotel, Coxhoe .....
Rugeley—Bakery and Slaughter-House .....	Corporation .....	The Architect, Co-operative Wholesale Society, Manchester .....

Scarborough—Outside Wood and Ironwork of the Workhouse .....	School Board .....	W. O. Woodall, Clerk, 32, Queen-street, Scarborough .....	" 29
Halifax—Outside Painting Akroyd-place, Bradshaw, Mixenden and Portland-road Board Schools .....	Corporation .....	W. H. Osler, Clerk, 23, Union-street, Halifax .....	" 30

# THE BUILDING NEWS

## AND ENGINEERING JOURNAL.

VOL. LXXVI.—No. 2308.

FRIDAY, MARCH 31, 1899.

### THE BUILDING TRADES.

THE report of the special sub-committee on the Building Trades, of which we recently gave a summary, is of considerable interest to all connected with building. We cannot here do more than refer to the recommendations. The sub-committee attach great importance to manual training and drawing and to theoretical classes. It has been shown, from inquiries instituted amongst great firms, that London employers are unwilling to take boys as apprentices, or to provide for them any means of instruction. Out of an enormous number of employés a very small percentage are apprentices and learners. The bulk of those who enter the trades are, in fact, recruited from the country. These youths are ill-fitted for the occupation in many instances, and they find it difficult to get into situations where they can learn anything. The masters want hands, and take raw youths who are willing to pick up what they can without trouble or expense to themselves. It is this kind of recruits which answers the speculative builder and many large building firms the best. Employers object to any responsibility with regard to instruction. Things are now a little changed. Building trade classes have sprung up; the polytechnics are fairly filled with students wishing to improve themselves, especially in trades like those of the carpenter and joiner, bricklayer and mason, and builders' clerk. The report observes there are over a thousand entries in building construction at the polytechnics alone, and the number of artisans attending classes in practical plane and solid geometry are on the increase. In addition, workshop classes in the several trades are opened at several centres, carpentry and joinery being the largest in number, plumbing coming next, followed by painters and decorators, bricklayers, &c. It is estimated that at least 1,500 youths and men engaged in the trades have been attending the classes during the present session, in addition to those attending the Science and Art Department classes. These figures are satisfactory; but, after all, they represent a very small percentage of the whole number of youths, apprentices, and journeymen in the trades. The class-goers will be found to be those of studious habits; but the great majority are beyond control. The Board has, we believe, appointed a sub-committee to inquire into the question, and to see if the provision of technical instruction in building is adequate, and how it can be improved. This latter object seems to be one requiring the best attention. We believe the practical work done by the students themselves is the most attractive part of the scheme of instruction in all trades. The elementary and advanced classes take the best amongst the more studious; but it has been found rather difficult, we understand, to interest the average student in elementary subjects, or even to get the apprentices, who prefer practical exercises, to attend the lectures or the classes in drawing, science construction, arithmetic, and subjects of this kind. The practical student in brick-cutting prefers to set out arches, gauged work, niches, mouldings, and to execute them in brick and putty, than to learn the theory or the drawing necessary; so the apprentice who just begins to master his tools is more inclined to practise his hands at making models of roofs and domes, of staircase winders, wreathed handrails, scroll steps, spiral stairs, or frame doors, &c., than

he is to master the elementary principles of carpentry, the mechanics of stresses. This preference may be noticed at most of the polytechnic institutions, such as at the Battersea Polytechnic. The ordinary student is impatient of theoretical training and principles, or even geometry and drawing; these subjects have little interest for him. This inclination for doing practical work, for turning out specimens of manual skill, ought to suggest to the teaching staff of these institutions, the need of teaching the theoretical through the practical; in other words, of persuading the students of each trade to prepare the detail drawings of the work they are about to execute. The plan adopted by some of the polytechnics, like the Northern, ought to be generally followed—namely, to get every student to set out or draw the details of his work. It is particularly necessary in trades like the bricklayer and cutter, carpenter and joiner, and mason; it also applies to other trades as well. The plasterer should, of course, be taught to model his work, and practical instruction in the plastering of walls and ceilings of ordinary materials, as well as on expanded metal and other iron construction and metal lathing, should be given. The co-operation of elementary knowledge with practical exercises seems to be not generally recognised; they are too often regarded as separate things, both by the instructor and the pupil. The scheme adopted in many instances is to encourage the students of practical work to attend the classes in geometry and drawing, and in most cases members of the practical classes are admitted to the lectures free. This is quite right, but the better course would be to attach to every elementary and drawing class a workshop or laboratory. The facts appear, at any rate, to point to the success of the special workshop classes. Of course, there will always be a technical and mechanical side and an artistic side to every craft, and while some will devote themselves to actual work, others will be disposed to follow the artistic part. The School of Arts and Crafts favours the latter side of the trades, and to it the trade schools must look for guiding principles. The practice of getting pupils and apprentices to design for themselves seems to be the most hopeful course to pursue. Set designs are useful at first, but the pupil who comes from a builder's workshop, and has any enthusiasm for his work, will be glad to show his ability. In the ornamental lead-work branch of plumbing this has been encouraged with good results.

The report goes on to refer to the difficulty that exists of securing for boys who desire to enter a building trade a suitable training. As we have pointed out in these pages, employers in the trades are not in favour of taking apprentices: they look out for men who are able to earn full wages, and can turn their labour to profit. It has been found from inquiry that "the great expenses connected with a building workshop in London necessitate that every branch should be employed in producing the most valuable output." These are serious obstacles to any system of instruction in London. In some cases, as in bricklaying, there are other difficulties in the way of an apprentice learning; he is not old enough to work on scaffolds, and the societies and trade unions put restrictions which are unfavourable to the system. The plumbers are better off in this respect, as the practice of sending a mate with a plumber opens the door for a clever and enterprising apprentice. The obstacles in the way of apprenticeship are indeed serious, and we do not see how the practical teaching of any trade can be effectually learned in any other way.

As the report shows, "the technical institutes do not afford an avenue by which a boy can enter a trade"; while they improve his condition when he is in the trade, and

tend to improve his technical skill, they fail to provide means by which the trade can be recruited. The conditions of London life and work are certainly most unfavourable to the system. London employers can import provincial workmen ready trained, and while they can do this it is not likely that they will produce workmen in London, where rents are dear and space is restricted. The evidence brought before the committee has established in fact that of the foremen and operatives who have come before them not one was born or trained in London. Such immigration to an overcrowded Metropolis is in many ways undesirable; thousands of building apprentices and young men are brought up yearly to the Metropolis, in many cases risking their own health, while they oust from the field other men who have more local knowledge but less training.

### ESTIMATES.—I.

ESTIMATING is an art that does not find much favour amongst architects as a rule, and for obvious reasons the making of estimates has been left to a class of specialists who devote themselves entirely to it. Consequently the cost of building does not always represent fairly the architect's requirements. Surveyors who prepare bills of quantities are not always within touch of the architect, and are sometimes obliged to interpret the plans and details or specification as best they can. The requirements of the contractor have also to be considered in their preparation. The important element of competition and the chance of winning must enter largely into the business, and the circumstances of builders are different. Profits vary much; for small works 40 to 50 per cent. may not be too much, but from 10 to 15 per cent. is regarded as a fair profit.

We propose in a few articles we commence to-day to take up the subject of estimating for architects, and treat it in a little more detailed manner than the usual approximate estimate. We shall take the usual items or headings as they occur in a bill of quantities for an ordinary house in the neighbourhood of the Metropolis. The prices we affix are those that may be considered moderate and safe for competitive tendering, they are given merely as a basis for estimating, and not as a safe guide in every case, as it is impossible to make the same estimate apply to a building in the extreme north as to one in the south, with differing conditions and soils. We do not believe in "cut-and-dried" estimates any more than we believe in cut-and-dried plans and elevations of buildings, and the man who publishes a list of prices now will find it quite unreliable in a few months hence or when applied to another locality. We shall, therefore, rather confine ourselves to illustrating the principles of estimating by taking a few prices that may be thought too low in some cases or beyond a competitive figure in others. It is always easy to add to, or deduct from, any item in any particular instance. There are prices at which work may be obtained, as well as prices at which a small profit may be made, and these can only be found in competition or from experience. Every builder soon finds out for himself in what position he usually stands amongst others of known repute, and the best test of the fairness of prices is only to be found in this way.

A few general rules may be stated here:—

1. Examine carefully the plans, elevations, details, and specifications of the intended building so that a fair idea may be realised of the work, read over carefully the specification with the aid of the drawings, and compare with the items of the bill. (This advice is, of course, intended for the builder; the architect's mind would be sufficiently imbued with his own work.)
2. Visit the site of the intended building,

to find out the nature of the soil, its removal if necessary, the facilities for the carriage of materials to and from, distance from brick-fields or quarries, the carriage of timber, if carts can be brought conveniently close to the building, so as to avoid unloading into barrows or other means of transit, as upon this very often a considerable difference of tendering is made. (This rule applies chiefly to the builder who is about to tender; but also to the architect who is often in ignorance of the soil and surroundings.)

3. Examine carefully the levels, and see if the allowances or depths for trenches for foundations, basements, drains, &c., given in the sections and quantities are correct; if insufficient, make a note of any discrepancy and query the items in the quantities. These items are often incorrect, as, when the site is sloping or uneven, the levels have been roughly assumed from a given datum line in preparing the drawings and quantities. The architect should observe this rule as well as the builder. The levels of the ground surface in their relation to a given datum or ground-floor level are important in determining excavations, and should be noted in the sections, and referred to a bench-mark near.

4. The subsoil is equally important. Sometimes, in digging, a very different soil reveals itself to that taken: there are sometimes loose sand, running water, rock, and other obstacles that have not been considered, and the price per yard for digging, removal of loose material, strutting sides of trenches, pumping, and cost of carting may make a considerable difference. The builder who knows the locality or site and the subsoil is, of course, in a better position than others who tender. On some sites sand may be found a few feet from the surface, and this may be valuable, and make a difference to the price; or it may be the sand has been screened and placed again on the site, and covered with loam, in which case the excavations will have to go down to the "virgin" soil.

5. The cost of materials should be obtained before estimating. The prices of stone, bricks, sand, lime, ballast, delivered on the site are all-important preliminaries to correct estimating. The prices of bricks, sand, lime, &c., vary very much in different localities. To take brickwork, several elements are necessary before a correct price can be affixed per rod, as, for example, the price of bricks in field, the carriage to works, if by barge or rail, the cost of loading, the freight, unloading, carting from wharf to works, the price per yard of sand delivered, and of lime, and cost of labour. If there is any terracotta or drain-pipes, the price delivered on the site should be obtained from the maker, and the same for any ironwork or other special material.

As all these elements are found to vary considerably, it is only possible to obtain an approximate price. The market prices of leading items in each trade ought to be known, and for this purpose trade lists and prices are necessary. The quotation of prices for particular items is important.

We do not propose to explain the method of measurement or taking out quantities, as these matters are dwelt on in ordinary text-books, such as Leaning's "Quantity Surveying," Prof. Banister Fletcher's "Quantities," &c.; but we shall note every new material or invention and the price. Many of the items of a bill require to be shown by a sketch, and we shall illustrate them where necessary.

Under each trade we shall first give the item in each case, explain its meaning if necessary, or illustrate it, describe any new materials, &c., and afterwards resolve the item into its elements, or analyse and price it. "Dissect as much as possible" is the rule given and adopted by all skilful estimators, and for this purpose certain units of

labour are useful, as, for instance, how much a man can do in a day or an hour of any particular work. These units are often difficult to obtain, and they vary much, according to the heaviness or hardness of the material.

When labour and materials have to be estimated certain elements or factors have to be considered. Thus, for example, for brickwork we take the price and quantity of bricks in a rod, also the quantity of lime, of sand, labour and scaffolding, and profit required. So with a piece of carpenter's work, like a floor, or a roof, we value it by the cubic foot, the elements being the prime cost of a load of fir (or price per cubic foot); cartage, which depends on distance; sawing into scantlings, waste in converting, to which is added the price of labour, and the profit 10 to 20 per cent. But it is impossible to assess the labour element with any degree of precision.

Price books do not help us, therefore the only way we can add the labour item to a cube foot of work of a particular kind is to find out how much of the required work a carpenter could do in a day. If there were tables published giving constants for every kind of labour they would be a help.

#### EXCAVATOR.

Much uncertainty generally prevails in pricing this trade as to the kind of soil to be excavated, if the soil is carted or wheeled a long or short way, if the excavation is deeper than 6ft. (the height a man can work), if filled in, where deposited. This item is taken according to the labour involved. It may consist simply of digging and carting, as in the excavation over the site, or of digging, filling, and ramming, as in trenches for foundation. In the latter, however, both kinds of labour are required. Thus, the "digging and carting" represents that portion of the excavation which is occupied by the wall, and has to be removed, and the "filling, and ramming" applies to that portion of the earth which is filled in and rammed against the walls. Then it is necessary to keep such items separate, as, for example, the excavation to basements, and those only on the surface, as in removing the top soil and wheeling away not exceeding, say, 9in. or 12in. deep. In the deeper excavations in friable soils timbering is necessary, as walling and strutting the sides of trenches, &c.

In pricing items of excavation, the depth and width of trench, the nature of the soil, and the quantity of timber, if necessary, the latter measured per foot super. on each side, must be known. Digging in gravel or stiff clay costs twice as much as in loose earth. The disposal of the stuff should be made

clear. Thus, the part of the trench to receive concrete may be described as "excavation and carting away, or wheeling and spreading," the portion to receive the brickwork being described as "digging to trenches, part filled in and rammed, and remainder carted away." The earth may be dug and thrown out, wheeled or basketed out, or carted away to make up other ground. Depths of 6ft., 12ft., or 18ft. should be kept separate.

Wall trenches in width are regulated by the spread of the footings, usually twice the thickness of wall at base, and room enough for men to work in the trench on one or both sides, usually 6in. beyond bottom course of footings.

Pumping and baling-out water is a speculative item, and its cost can only be approximately put down.

Laxton estimates that in loose ground a man can throw up about 10 cubic yards of earth per day; but in hard gravelly or stiff clay five yards is considered a fair day's work. Every yard of concrete requires about three hours' labour to mix and throw into trench.

460 yards super.—Removing surface of site, not exceeding 12in. deep, average wheeling and depositing 1 run (20 yards).

Put 4d. for the first portion of this item, and for wheeling and depositing 3½d. or 7½d. per yard superficial. If the top surface is grass, add 4d. more, as the top has to be cut.

220 yards cube.—Digging to basement from last level to depth of 12ft. average, throwing out, wheeling to terrace 20 yards and depositing.

If the soil is stiff clay, which is generally the nature of subsoils near London, put 11d. or 1s. per yard for digging and throwing out not exceeding 6ft., and for remainder of depth add 6d., making, say, 1s. 3d. per yard cube in the average. For wheeling and depositing, add 3d. and 2d. for profit, making a total of 1s. 8d. per yard cube. If strutting is necessary, add 1d. In loam or sandy soils, 9d. or 10d. may be sufficient for digging and throwing out.

15 yards cube.—Excavate to basement trenches, part fill in and ram, and remainder wheel to terrace, 1 run.

This extra digging may be done at 6d. per yard cube; for wheeling, say 3d.; for filling and ramming, 3d.; total, 1s. per yard cube.

25 yards cube.—Excavate to surface trenches, wheeling, and depositing; part fill in and ram.

To price this and the previous item consider the quantity of soil wheeled away, and that which is filled in the trenches and rammed. This will depend on the proportion of trench left vacant after the brickwork is in. A section of the trench and footing will enable the quantity to be estimated. Let us suppose half the soil is returned and rammed. Then if we put the digging at 10d., and to this add half the cost per yard of filling and ramming, say 3d., and the remainder wheeling and depositing 3d., we get 1s. 4d. per cube yard.

We may here note that earth and clay increase one-fourth when dug, sand and gravel one-tenth, chalk one-third.

For large trenches and foundation work, when the earth is filled in and rammed, it is perhaps better to make a separate item, as "excavation and returning, filling, and

ramming," the quantity measured from outer face of brickwork, to side of trench by the depth to the footings, and deduct this from total excavation.

50 yards run excavation for drain-pipe, 6in. diameter.

If this is a trench about 2ft. by 1ft., 3d. per yard may be put down, including digging, filling, and ramming.

#### ROYAL SOCIETY OF BRITISH ARTISTS.

THE Society opens with a fair average of interesting pictures, though few of them of any great merit. The most remarkable, as well as the most original, picture is F. Cayley Robinson's work, "The Close of Day" (7). Here we have a neatly furnished room of somewhat old-fashioned style; the daylight still enters through bright green curtains, while below the window on the end of a long table spread with a white cloth, are two lighted candlesticks, which shed their warm glow over the table. It has been laid for the last meal of the day with three plates and two glasses each. Seated in the foreground is a lady in light-colored muslin listening to one of Mendelssohn's "Songs without Words," which stands on the corner of table. Leaning over a book of devotion or a Psalter a young girl is also listening to the strains, while another contemplative sister stands near the end of table. There is a quaintness in the occupants and furniture of the room; but this time nothing Mediaeval—rather a plain English country home of the "fifties." The three demure-faced women, or three sisters, are neat, everything is ordered, and there is a religious reverence in their demeanour. Over the table is a triptych representing a Scriptural subject. It is not everyone's picture; but the subject and technical minuteness of the scene interest, despite the almost formal stiffness or quaintness of the figures. The three girls are not prepossessing: there is almost a grotesque primness about the one standing against the wall; but the realistic study of details, the musical box, the double lighting, the inlaid end of the table, the tones and reflection of light are all extremely natural. There is undoubtedly a hidden meaning in the composition: it appeals with more directness than many of the conventional works of this class, and there is sincerity and earnestness in the painter's work. Montague Smyth's feelingly-painted landscape or common, "A Grey Evening" (2), is charming in its gradation of tone, light and shade, and the reflection of the grey sky in the pool by the deep-rutted roadside, by the side of which a shepherd and his sheep are passing. Near it, Stuart Hobkirk's very graceful study of a lady, seated by a small buhl table with flowers, "A Hundred Years Ago," is refined in colour, and the rich brocaded dress and accessories painted with care. Hubert Coop, also, in No. 6, gives evidence of power and broad handling in his large coast view, "Near the Shelter of the Hill"; Val Davis is happy in his "Fen Village"; and Jas. E. Grace has not lost the charm of his delicate handling (14). "The Village Carnival" (17), by R. Gemmell-Hutchison, is an able work. It is a scene at a country fair, gipsy-caravans, roundabouts, travelling showmen, and booths surround a throng of rustic folk and children. Seated on a donkey is a little columbine, a clown beating a drum, and other preparations for a performance are going on. The painter has thrown into his work much enthusiasm and humour. His characters are well chosen in the crowd of villagers, and the colour is restrained—perhaps hardly strong enough. Martin Bruce is a disciple of the Glasgow school. His three or four works have a chromatic arrangement. "The Three Windmills" and "I saw Three Ships a-Sailing" (30) are im-

pressions of colour and archaic form, bright and crude. "In the Surrey Docks" (107) is another example. A vigorous Dutch riverscape is "Evening Gold" (23), by Alfred S. Edward, in tones of amber and purple. William Strutt's very fanciful and pretty composition "Spring" is delicate in its blossoms and frolicsome lambs. Over the fireplace a circular picture by Leonard Watts, "A Cup of Falernian" (45), shows a Greek or Roman maiden in blue drapery seated in a marble alcove by the sea, holding a cup of the celebrated Roman wine. Beyond the terrace is the rich pink blossom of an almond-tree. There is refinement in the composition and colour. Frank Spenslove-Spenslove's dark landscape, "A Soliloquy of Night" (57) is both poetic and powerful, the deep blue distance and the moonlight helping to cast a greater gloom over the landscape. F. A. W. Armstrong's strong landscape "Evensong," A. D. McCormick's "Gathering Beans" (55), and W. Manners' "Broken Weather" (56) are noteworthy. Amongst small studies, Philip H. Newman's "Le Dernier Prix" (39) is a pleasing and graceful figure study.

At the end of gallery is a large and imposing picture by the President, Sir Wyke Bayliss, "Interior of Amiens Cathedral" (90), a noble perspective of "long-drawn aisles," clustered shafts, and soaring vaults full of mystic light and colour, and a procession of robed priests, acolytes, and thurifers. The President has lost none of his fascinating power of idealising the architecture and accessories of the great cathedral. Sidney Muschamp's little piece of genre, "Her Ladyship," a little girl in white descending a scarlet-carpeted staircase with her attendant, is spoilt by the brightness of the red. "Reunited: the Shunamite's Son Restored," by G. Hillyard Swinstead (60), is dramatic and harmonious in colour. The large centre picture by John Martin, "For a Dream's Sake," a lady reading an old letter by lamplight and glancing at a photograph, is a subject that would have gained by the reduction of the canvas; the unilluminated portion of the room is unnecessarily large, and weakens the effect of the subject; the lamplight tones are successful. Reginald Smith's "Sheep Pastures by the Sea," J. W. Parson's large seascape (116), and Wright Barker's "Rustic Gallant," are works of pretension, if not very convincing. A very beautiful tracery portal with canopied niches, "The Bride's Door, St. Sebald's, Nuremberg," by the President, and Francis Black's powerfully-painted landscape, "The Spinney," are worth attention.

The end galleries contain a few works. R. Machell's "Parsifal" (164) is not so happy as a symbolical work as his former contributions. The two panels with carved frame, with a figure in low relief, gilded, holding the Holy Grail, are decorative and flat in treatment. Various hues are blended in illustration of the legend, which is given in the catalogue. One panel represents Klingsor hurling the stolen spear at Amfortas; in the next panel we see the wounded man, whose wound is healed by Parsifal, when the spear is restored to the Cup of the Grail. William Strutt's "Lady Godiva" represents the lady about to descend the steps to mount her trapped palfrey. The technical qualities surpass the composition. The modelling of the fair Godiva, the leopard-skin on the threshold of the castle, and the flowers strewn on the steps are scrupulously painted. The large landscape, a wooded hillside, "The Home of the Woodpigeon" (212) is too large, and there is a want of breadth and shadow; but the glimmering sunshine is well painted. In Terrick Williams's "Little Breton Church" and "Old Folkestone" are clever. The landscape by T. F. M. Sheard, "Golden Harvest," truly explains its character. Mr. Sheard is a master of sunlight effects, as we see in his

"Arab Mosque" and an "Arab Home," and his Oriental studies in which light and shade and heat are suggested. In this harvest scene we have a strong presentment of a hot late summer day. The labourers are seated together refreshing themselves in a shady spot. Upon them pour the fierce rays of the midday sun, the golden sheaves are steeped in light, and the distant uplands proclaim the intense heat. A large sunset effect by C. H. Eastlake (255); Thos. Ireland's "Haunt of Sweet Solitude," a woodland of browns and yellows; the masterly studies of "Fowls" by Horace Mann Livens (275); Adam E. Proctor's Cornish village scene, "The Old Fishwife" (302), are of interest. W. Lee Hankey has several water-colour studies. "Noon Day" (322) is charmingly simple in the figure of the fisher-girl with her net and the boats behind. The breadth of light and shade and colour are strong. "When Daylight Fails" (337), a study of a peasant girl in the dark twilight, with the glimmer of a cottage light, is strong and pathetic, and the same characteristics of simplicity and sincerity mark his girl seated in a graveyard, "We are Seven" (394) and "The Road to the Farm" (435).

In the Water-Colour Gallery we notice several other works by Leopold Rivers (315 and 327), a crisply drawn sketch of "Timber Ships," by W. T. M. Hawksworth; Chas. E. George's study of a cottage at "Bewdley" (318); H. K. Rooke's "Lonely Coast"; A. Tatton Winter's "Homeward" (333)—girls with bundles of bracken trudging along through a lonely common; the soft amber tones of evening make a rich harmony of colour, and the whole is feelingly treated. Several works by Jas. E. Grace (358, 359, and 400) are here. No. 387, "When Summer Leaves are Flown," by Albert Kinsley, and "The Golden Glow" (484) are dexterous in the brushwork, in the delicate handling of twigs and branches, and the colour harmonious. The President sends a charming drawing of "The Monastery of Fiesole," a fine Romanesque church. And we note clever sketches by Montague Smyth, Henry Stannard (367), and a broad view near St. Moritz, by Leopold Rivers (410); also Cecil Aldin's amusing canine study, "Charity" (423), Tom Browne's "Lonely Road," J. D. Ferguson's charming sunlight colour in "Flower Market, Paris" (437), Geo. C. Haite's "Promise of Spring" (442) and "After the Rain" (448). Brilliant sunlight effects and colour and great breadth are attainable by the vigorous crisp handling of Hans Hansen in his "Spanish Fishing Boats" (471). On the screen we notice a very clever architectural interior by W. Harding Smith, "The Dom Kirche, Halberstadt" (481), and in the vestibule are seen a collection of studies and sketches by W. H. J. Boot, vice-President of R.B.A., chiefly of views at Tunis, Bruges, Cairo, Venice, Florence, and other Continental places, and marked by breadth and strong colour.

#### IRON CONSTRUCTION IN DRAINAGE WORK.—IX.\*

By T. E. COLEMAN, F.S.I.

WATER-CLOSET fittings are now made in a most bewildering variety of design to suit every imaginable situation or requirement. They are capable of being grouped into five or six distinct types according to the broad principles underlying their general construction. Of these, the most important are known as pan, valve, wash-out, wash-down, or siphonic-action closets. The leading characteristics of a few closet fittings will be briefly mentioned.

Fig. 136 is a section through an ordinary pedestal wash-down closet, the basin and trap consisting of one piece of glazed earthenware or fireclay. Manufacturers of closets of this description usually make them with both P and S

\* All rights reserved.

outlets, so that they may be obtained to suit different local conditions. The S, or "turn-down," outlet discharges the contents of the closet in a vertical direction; whilst that commonly known as the P outlet may vary from a nearly horizontal position to an angle approximating to the Q form shown in the sketch (Fig. 136),

FIG. 136.

according to the particular design or make of closet selected.

In some cases the wash-down closets are so arranged that the space immediately under and around them is perfectly free and open, the fitment being either supported on brackets or built into the wall. Fig. 137 shows a closet manufactured by Messrs. Finch and Co., having the basin and trap formed in one piece of earthen-

FIG. 137.

ware, together with a stout lug or projection for securely pinning into the wall. The wooden seat can be readily removed for cleaning purposes when in a vertical position, the hinges or pivots being designed to work within suitable slots provided for this purpose. Closets of this description are more particularly adapted for hospitals and similar situations where it is of the greatest importance that no corners or resting-places will be formed

FIG. 138.

for the lodgment of dirt or other foreign matters, whilst every facility is given for the washing and cleansing of the floor.

The details relating to the connection of an earthenware closet with an iron soil-pipe and a lead anti-siphonage pipe are indicated in Fig. 136. The joint between the socket of the iron soil-pipe and the earthenware outlet is partly packed with yarn, and afterwards filled with neat Portland

cement as previously described; whilst that between the lead anti-siphonage pipe and earthenware socket is made by means of a brass or copper ferrule soldered to the lead pipe in the usual manner, the space between the ferrule and socket being filled with cement. Many ingenious expedients have been devised for obtaining a satisfactory connection between materials of dissimilar nature. Fig. 138 shows a section of the "Mansfield" patent connection for joining stoneware to lead, as in the case of an earthenware closet outlet and a lead soil-pipe. It consists of a fireclay ring partly covered with lead so as to carry out the principle of "like to like" (in this instance, lead to lead, earthenware to earthen-

FIG. 139.

ware). A solder joint is made between the lead lining and lead pipe, whilst the space between the stoneware ring and spigot is run with neat cement. Another modification of this joint is seen in Fig. 139. The lead lining of the earthenware connecting ring is soldered to the lead pipe, whilst the annular space between the stoneware socket and ring is filled with cement.

Fig. 140 is an illustration of the patent O.B. closet, in which a novel arrangement of flushing apparatus has been introduced. The closet basin is fitted with the usual polished wood seat and cover, whilst a water retainer or waste preventer

FIG. 140.

is fixed immediately behind and above the seat. The special departure consists in the regulation of the water supply in the waste preventer by means of a short lever attached to the closet-lid. When the fitment is not in use, the lid is turned down upon the seat, so that the basin and water-pool are hidden from view. At the same time, the attached waste-preventer is quite empty, nor can any water enter the flushing cistern whilst the lid is closed. On using the closet, the act of lifting the lid opens the water-supply valve, so that the waste-preventer fills in a few moments, and is ready for service. The basin is flushed by simply turning down the lid, when the water-supply is again cut off, the dead weight flushing valve being raised at the same time, and the waste-preventer rapidly emptied of its contents. The flushing cistern then remains empty until the lid is again raised, when the process of filling is repeated. By this means, it

is claimed that there is no risk of injury or disarrangement of the flushing apparatus by frost, as both the cistern and flushing pipe are quite

FIG. 141.

FIG. 142.

empty when not in use, whilst an unseen and quiet flush is also obtained.

The well-known "Optimus" patent valve closet is illustrated in Fig. 141. It consists of a

FIG. 143.

glazed porcelain basin with a hinged valve contained in an enamelled cast-iron valve-box immediately under the basin outlet. A lead trap is connected to the soil-pipe and to the valve-box. The basin overflow D is trapped and arranged to discharge into the air-pipe which is taken from

the valve-box, whilst the flushing-rim of the basin is carried round the top of the overflow (as indicated at D) so that the overflow pipe is well flushed and its trap or water-seal supplied with clean water every time the closet is used. To maintain the water in the basin at a uniform level in the event of a small leakage or defect in the water supply-valve, a small "regulation" hole is made through the side of the basin into the overflow arm. In this sketch (Fig. 141) the closet is shown provided with a supply-valve, G, and copper bellows regulator F, fitted with air-cock for controlling the quantity of water to be supplied for flushing purposes.

Fig. 142 is a section through the "Simplicitas" patent valve closet. It is a combination of the ordinary wash-down and valve types of closet. The basin and trap are constructed of glazed earthenware, and a valve is arranged near the basin outlet so as to provide a larger water pool than is found in the usual form of wash-down closet. The general appearance of the whole fitment when fixed complete is seen in Fig. 143. On pulling the handle of the waste-preventing cistern, the basin is flushed with water, and at the same time the closet-valve is opened and the contents of the basin discharged. When the valve closes, the basin fills with water to the overflow level. Should a leakage occur—owing to the valve not sitting tightly upon its seating—the

so as to admit air to the siphon leg (D) when the flushing cistern is not being used. This closet is also supplied with a waste-preventing valve for fixing under the seat in lieu of a waste preventing cistern.

Fig. 145 shows the general arrangement of the

Fig. 145.

flushing cistern used in connection with the foregoing siphonic action closet. It is designed to give an after-flush immediately the flushing and siphonage of the contents of the basin have taken place, so as to insure that a proper quantity of water is retained within the closet basin. The cistern is unequally divided into two compartments, the larger of which contains the main

providing an after-flush to the closet. The float of the water-supply valve is placed within the after-flush compartment, so that when the cistern is empty the valve remains fully opened during the whole of the time the main compartment is filling, and the float will not commence to rise until the water flows over the weir or division into the smaller chamber. This is a great advantage for situations where the closet is in constant requisition, as the cistern is rapidly filled in readiness for the next user.

A section through Shanks's "Barr-head" patent siphonic closet is shown in Fig. 146. The long arm of the siphon is arranged with a "swelling" or "bulge" near its lower end, so that by this means a solid plug of water is formed within the siphon, and the contents of the basin withdrawn by siphonic action. The basin is afterwards filled with clean water to the level shown. The closet may be arranged with an anti-siphonage pipe fixed at the side of the enlargement or bulge (as indicated by the dotted lines), so as to prevent siphonage when slops are poured into the basin, whilst allowing siphonic action to take place when the cistern is discharged.

In addition to the different classes of closets which have already been mentioned, all of which are flushed with clean water, there is another type of fitment made, in which slop or waste waters

Fig. 144.

basin will still retain a water pool above the valve (as indicated at A, Fig. 142), similar to that ordinarily obtained in a closet of the wash-down pattern. Every portion of the closet is exposed to view.

Within comparatively recent years a type of closet has been introduced in which the contents of the closet basin are discharged by siphonic action, instead of being carried through the trap by the force of the water-flush alone. Fig. 144 is a sketch of Jennings's patent siphonic closet. In this illustration two traps are provided to the fitment, the connecting portion of the soil-pipe (D) between the two forming the long leg of the siphon, by the action of which the basin is emptied. An anti-siphonage pipe is fixed to the crown of the lower trap, whilst the space between the two traps is ventilated by the puff pipe (E). The service, or flushing-pipe from the waste-preventer has two connections with the closet, one to the flushing rim of the basin, and the other to the top of the long leg of the siphon-pipe (D). When the handle of the waste-preventing cistern is pulled, the water becomes divided into two streams, which simultaneously flush the basin and discharge into the siphon leg (D). This sudden rush of water causes the air contained within the siphon leg to be entirely expelled through the puff pipe (E); siphonic action is immediately set up, and the basin is emptied of its contents. The basin is then refilled with clean water by means of an after-flush device in the waste-preventing cistern. To prevent siphonic action taking place when slops are emptied into the basin, the pipe (A) is fixed

Fig. 146.

siphon. Within the smaller chamber is placed the short arm of a subsidiary siphon, the long arm being taken into the flushing pipe (or long arm of the main siphon). By pulling the handle the plunger working within the dome or short arm of the main siphon is correspondingly raised, and a quantity of water driven over the top of the

Fig. 147.

flushing pipe (or long arm of the main siphon), so that the contents of the large compartment are rapidly emptied. This discharge of water within the flushing pipe sets the subsidiary siphon in action, and at the conclusion of the main discharge, the water within the small compartment is passing down the flushing pipe, thus

are used for flushing purposes. Fig. 147 is an illustration of the "Stafford" waste-water closet. The slop-waters from the scullery sink, together with the storm and waste-waters from the surfaces of areas, yards, &c., are collected within a pivoted vessel, or "tipper," which automatically discharges its contents when full, and carrying with it the deposited faeces. The tipper is so arranged that it can be taken out at any time for cleansing purposes, &c., by previously taking down the pedestal seat.

Slop and waste-water closets are cheap in construction, and require no special supply of water for their use other than the waste waters ordinarily resulting from the exigencies of domestic life. For these reasons they are used in some parts of the country as an outdoor closet in connection with houses of the poorer class. They are not suitable for fixing inside the dwelling-house. When necessarily adopted, waste water-closets are usually arranged so as to be placed in a detached outbuilding where an unrestricted circulation of air is available.

Fig. 148 is a sketch of a water-closet seat having a hinged cover. The cheaper varieties are made of deal, but polished mahogany or other hard wood is generally used. What is known as a "balance" seat is illustrated in Fig. 149. The portion of the seat which extends beyond the pivots is fitted with iron weights, so that in its normal condition the seat assumes a vertical position. The fitment may then be conveniently used as a urinal or slop-closet. The under-side of the seat is provided with small indiarubber buffers for the purpose of preventing any damage, should the seat be at any time violently turned down upon the top of the basin.

A closet seat formed of thin moulded steel plate

Fig. 148.

Fig. 149.

thickly coated on the surface with an impervious non-conducting composition has recently been introduced. Owing to the non-porous surface thus obtained, the impurities from slops and other liquids are not absorbed; whilst the non-conducting covering entirely prevents any feeling of coldness striking the surface of the body when in contact with the seat.

The water-supply to closets, urinals, &c., must be so arranged as to be quite disconnected from the water used for drinking, cooking, &c. This is generally effected by providing a small cistern or water-waste preventer holding from one to three gallons (according to the particular requirements of the case) immediately over each closet or other sanitary fitment, and which is used solely for flushing purposes. The waste-preventing cisterns are generally constructed of cast iron, either enamelled or painted; but they may also be obtained in glazed porcelain, or of wood lined with sheet lead or copper. The water-waste preventers are usually designed to discharge their contents by siphonic action, the siphon being set in motion either automatically or by simply pulling a handle.

The supply of water to waste-preventing cisterns is regulated by means of a "ball-valve" fixed above the normal water-level of the cistern,

FIG. 150.

FIG. 151.

FIG. 152.

so that complete disconnection between the service pipe and the flushing cistern is obtained at this point. The ball-valve consists of a tap which is automatically opened and closed by means of a light hollow copper ball attached to a short lever. The extremely light specific gravity of the copper ball causes it to float on the surface of the water, and it accordingly rises and falls in unison with any corresponding variation of water-level.

Many different patterns of ball-valve are now obtainable from manufacturers of these appliances. Fig. 150 is a section through an ordinary form of ball-valve. The valve consists of a solid cylindrical brass plug working vertically within a small grooved chamber forming the nozzle of the tap. The upper end of the plug is fitted with an indiarubber or leather washer, in order to afford a suitable cushion for contact with the valve-seating. At the lower end a slot is provided, through which passes the pivoted end of the stem and ball. When the cistern is empty, the copper ball falls a short distance, carrying with it the solid plug; the water is then free to issue through the open valve and down the grooves at the side of the valve-chamber. As the water rises within the cistern, the floating ball is raised, and the attached stem or lever gradually forces the plug to return to its seating, so that the valve becomes closed.

Fig. 151 is a slight modification of the preceding arrangement, the plug or valve being designed to work in a horizontal direction.

The type of valve known as an "equilibrium" ball valve is illustrated in Fig. 152. In this case, the valve (which is faced with an indiarubber or leather washer) is connected to the brass working plug by a short spindle, the upper end of which is fitted with a cupped leather. The result is that the head or pressure of water in the pipe

exerts both an upward and downward hydrostatic pressure upon the exposed faces of the valve, thus tending to produce a condition of equilibrium within, and consequently rendering the valve more sensitive to any external force which may be brought to bear thereon by leverage from the arm of the floating copper ball.

Automatic siphonic action flushing-cisterns

FIG. 153.

should be furnished with what is known as a "reverse action ball-valve." When the ordinary ball-valve is used, it is sometimes found that the very small dribble of water is insufficient in volume to start the siphon, so that a waste of water takes place, and the required flush is not obtained. A reverse action ball-valve is so arranged that when the cistern is nearly full the valve is opened, a rapid influx of water takes place, the siphon becomes properly charged, and the requisite flush is insured. Valves of this description should admit of being regulated so that the flow of water may be accurately adjusted to the requirements of each particular case.

The flushing-pipe from the waste-preventing cistern to the closet is ordinarily exposed to view, and formed of 1½ in. diam. lead or wrought-iron pipe. For work of a superior class, polished copper, brass, or nickel-plated pipes are used and secured with clips of the same metal. Fig. 153 is a flushing-pipe of this description (7ft. long) arranged with all necessary bends, together with union for connecting to the outlet of cistern. It is fixed to the wall by means of the two clips shown.

Where safes or trays are provided under water-closets, baths, &c., the outer end of the waste-pipe should be fitted with a brass or copper hinged flap to prevent the passage of air currents from

FIG. 154A. FIG. 154.

the outside to the inside of the building. Fig. 154 illustrates a simple form of brass hinged flap for fixing to the waste, the end of the pipe being neatly cut and shaped to form a seating for the flap. Another form of brass flap-valve suitable for soldering to the end of a lead pipe is seen in Fig. 154A. Similar flap-valves provided with a screw-union for fixing to iron pipes are also manufactured.

#### THE SOCIETY OF ARCHITECTS.

THE monthly meeting of the Society of Architects was held at St. James's Hall, Piccadilly, on Thursday in last week, the chair being occupied by Lieut.-Col. F. Seymour Leslie, R.E., Vice-President. The following four gentlemen were elected as members:—F. G. M. Chancellor, Wiltshire House, Mattison-road, Haringay, N.; Walter Cook, Masonic Buildings, Bridgend, Glam.; R. F. Fulford, 16, Parkhurst-road, Holloway, N.; and G. P. Smedley, 110, St. Martin's-lane, W.C. Various donations to the library were announced by the secretary, Mr. C. McArthur Butler.

#### THE EXPERIENCES OF ARCHITECTS IN THEIR RELATIONS TO LOCAL AUTHORITIES.

A free discussion on this topic took place, introduced by Mr. ELLIS MARSLAND, Hon. Secretary,

in the course of which various members narrated hard cases and awkward incidents in reference to the non-approval or rejection of plans by urban and rural councils, the "i's" and "t's" being broadly dotted and crossed with regard to the conduct of surveyors, clerks, and members of local authorities. In opening the subject, Mr. MARSLAND remarked that the Council of the Society had frequently to consider letters from provincial members complaining of the difficulties put in the way of passing plans by local authorities, and thought they would arrange an evening at which grievances could be freely ventilated, and some attempt made to see if any remedy could be provided.

Mr. WILLIAM COOPER remarked that architects practising in Hastings had to deal with a corporation with an excellent code of by-laws, but within a radius of a couple of miles were one urban and two rural authorities, whose regulations were not always so clear nor so uniform in administration. A great blot on the more sparsely peopled districts was the miserable salary paid the local surveyor, often as low as £50 or £60 a year, who had few opportunities for increasing his earnings by private practice, except in surveying. This prevented the better class of man from coming forward as a candidate, and when men retired from other and dissimilar occupations were appointed as surveyors, it was evident that their recommendations as to the passing or rejection of plans were not always based on adequate grounds, with the result that building owners were sometimes put to great and absolutely needless delay and expense. As to the discrepancies in local by-laws, he quoted a ludicrous instance within his own knowledge where a house which was built on the boundary of two districts had to be differently constructed as to thickness of walls and amount of air space to suit the diverse requirements of the two authorities.

Mr. G. GARD PYE mentioned that some short time since he received instructions to prepare plans for a large institute in a country town, and naturally wrote at once to the borough surveyor for a copy of the local by-laws. To his surprise, he was informed there was no code of regulations, and on further inquiry it was said that the corporation used their own discretion in passing or rejecting plans. Having instanced difficulties which had arisen in other towns and in villages, as to the interpretation of building regulations, Mr. Gard Pye urged that it was desirable that steps should be taken to secure some uniformity of administration. It would be beneficial if one set of by-laws were promulgated applying to the larger towns, and another less stringent one to be enforced in rural districts.

Mr. J. R. MANNING thought that architects should not blame too freely the surveyors to district councils for delaying or refusing to pass plans, for too often officials were the scapegoats of building committees, some members of which bodies took a delight in sending back plans or in demanding tracings on linen and other expensive and useless luxuries. He had known members to secretly exercise their prejudices so far as to persistently reject the plans of one architect while passing without modification or objection those submitted by other men. The approvals of deviations from by-laws as to air space behind dwellings were often arbitrarily and unfairly given and withheld, especially in sparsely populated districts. If surveyors to local authorities would examine plans while yet in pencil, and then express their opinions and requirements, it would save time, trouble, and expense to architects and their clients. He gave instances of the incompetence of some surveyors who were unable to interpret their own regulations.

Mr. C. McARTHUR BUTLER, secretary, said he had seen adopted in a Northern town the method recommended by the last speaker. When depositing plans, architects were informed by the borough surveyor whether they were likely to be passed or not, and in the latter case the grounds of disapproval. This course gave opportunities for correction, and it was a rare thing to hear of a plan being rejected when finally brought before the building committee. In some districts a set of working drawings executed on linen had to be deposited with the surveyor—a totally unnecessary proceeding. Architects would fare better with the committees if, wherever a plan was disapproved of, they insisted on knowing the grounds for rejection, and the particular by-law transgressed.

Mr. T. R. RICHARDS pointed out that another grievance against provincial councils and their

NEWELS FROM SOUTH KENSINGTON MUSEUM.

surveyors was that they often kept plans in hand for a lengthened period without coming to a decision. He could not understand why it should be necessary to deposit plans with all county authorities when no such regulation existed in London. In the Metropolis, building owners and their architects were supposed to know the Building Act, and so long as its requirements were not transgressed district surveyors did not interfere.

Mr. W. C. WILLIAMS said, as a solicitor, he considered the remedy which went to the root of the whole matter would be to assimilate the building regulations throughout England into one Act. The drafting of the London Building Act of 1894 was certainly obscure; but it had gradually been interpreted and settled in the courts, and its requests were generally understood and complied with. Why should each little corporation and urban and even rural district council be allowed to form its own more or less perplexing regulations, in total disregard of what was enforced in the neighbouring districts? At the utmost two sets of building by-laws—one applicable to urban, the other to rural authorities—should be framed and enacted; building owners would not then be at the mercy of often incompetent committees, and the poorly-paid and the more or less intelligent surveyors in the interpretation of vague and varying regulations, but could study the general building law, and keep within its demands.

Mr. C. A. BASSETT-SMITH concurred in all Mr. Williams's remarks, and emphasised the desirability of reducing all building codes outside the Metropolitan area to two—urban and rural.

Mr. F. W. MACEY agreed with the last two speakers, but thought that the certain amount of discretion given in the Building Act to the County Council should be provided for country authorities, so as to allow difficult sites to be built upon, or exceptional buildings to be erected.

Mr. ELLIS MARSLAND pointed out that most corporate urban and rural authorities founded their by-laws on the model code framed by the

Local Government Board in 1877, with variations to suit their local requirements. The great distinction between building regulations in London and outside it was that in the Metropolitan area an owner could go on building, and provided he did not infringe the provisions of the London Building Act, the district surveyor would not interfere with him; but outside that area the person proposing to build had first to submit plans to the local authority and await their approval. This necessity to obtain the sanction of the authority inevitably caused delay and expense, and was a needless display of red tape. If a building owner outside the Metropolitan area thought approval was unjustly withheld or needlessly delayed and decided to proceed with the work, he would at once be pulled up short and charged with beginning to build without having first obtained the sanction of the authority, and the local bench of magistrates would have no option but to convict on this side issue. Even if the aggrieved building owner successively appealed to quarter sessions, a Divisional Court and the Court of Appeal it would be almost impracticable to enter into the real merits of the case, and progress of the building could thus be arbitrarily blocked by a building committee or their surveyor. There could be no valid objection to extending the London system throughout England. With all their punctiliousness, extra-Metropolitan bodies made no provision for various emergencies which in practice often arose. For example, except in London there was no machinery for dealing with alterations to party-walls, and hence in country houses, unless a building owner could make terms with his neighbour no power existed to compel an agreement between them. He thought the London regulations with reference to party-walls were fairly perfect.

After considerable further conversation and discussion, the CHAIRMAN summed up, remarking that personally he was in the happy position at the War Office of being above all by-laws, and therefore could look on the controversy impartially and dispassionately. It was obvious to him as an outsider that the present confused tangle of

separate building regulations for every petty authority was needlessly perplexing, and that a statute law, or, say, an urban and a rural code, defined by legislative enactment, would be infinitely preferable to a series of conflicting and variously interpreted by-laws. How was the uniformity all saw to be desirable, and indeed necessary, to be brought about? Obviously it would only be secured by a general Building Act, and to get such a measure passed through Parliament was, in the present pressure of public business, a very serious and formidable undertaking. He could only hope that the practical discussion that evening would do something to prepare minds of architects for such a movement.

#### NEWELS FROM SOUTH KENSINGTON MUSEUM.

THIS week we give further sketches of three interesting newels recently acquired by the museum authorities. They come from houses in Brussels lately demolished, and date about the 17th and 18th century. The posts are nearly all of oak, and are carved with the ornament usually seen on woodwork characteristic of that period—such as festoons, rosettes, and acanthus leaves. The newels appear to have been the ordinary form in use on staircases in Brussels.

#### BOOKS RECEIVED.

*Gloucester: the Cathedral and See* (London: George Bell and Sons). This handbook, dealing with the cathedral church of Gloucester, its fabric and episcopal see, has been written by Mr. H. J. L. J. MASSE, M.A., as the fifteenth of the now familiar uniform green cloth-coloured monographs in Bell's Cathedral Series, all of which, on publication, have been noticed in these columns. It is illustrated by an excellent plan of the minster, and by forty-nine reproductions of black-and-white drawings by Mr. E. J. Burrow, photographs, or engravings. The author expresses his obligations to Mr. F. S. Waller, F.R.I.B.A., the

cathedral architect, for allowing the use of his "Notes and Sketches of the Cathedral" (a book now out of print), and to Mr. W. H. St. John Hope for permission to quote from his "Notes on the Benedictine Abbey of St. Peter at Gloucester." Mr. Massé traces the history of the building so far as it is known from the records, and refers to the restorations successively carried out under Wyatt, Sir Gilbert Scott, and Mr. F. S. Waller. He points out that externally practically the whole fabric, as far as the author is concerned, remains as it was at the beginning of the 12th century. The arrangement of the group of buildings differs in one essential part from almost every other in the kingdom—the cloisters, instead of being on the south, are on the north side of the church. The cathedral is a storehouse of every period of Gothic from the Later Norman, with the exception of the Decorated, of which there are but scanty remains. The most striking external feature is the central tower, the work of Abbot Seabroke (1450-57); the west front, rebuilt by Seabroke's predecessor, John Morwent (1421-37), although simple, is admittedly inferior in effect to that of most other edifices of its class and proportions; the beauty and grandeur of the interiors of the nave, choir, and Lady-chapel are done full justice to by Mr. Massé.—Two other volumes in Bell's Series have also come to hand from the same publishers—*York and Beverley Minsters*. The little work on "York: its Cathedral and See," is written by Mr. A. CLUTTON BROOK, M.A. He discusses at considerable length the early history of the city, pointing out that, unlike Ely and Lincoln, the houses did not grow up around the cathedral, for York is an immemorial, a prehistoric city, and was the headquarters of the Roman army in the north soon after the conquest of Britain. The see is traced from the somewhat shadowy days of Paulinus. Passing on to the Cathedral, Mr. Brook mentions that at the end of the twelfth century the minster was utterly unlike the present building; except in the crypt and in parts of the nave and tower, not visible to the casual observer, there are no vestiges of the work of the earlier builders. The oldest parts of the existing edifice are the south and north transepts, and the nave itself was rebuilt between 1298 and 1320, the west part being the latest work except the vault, and the chapter house was added after the latter date, the reconstruction of the choir being begun in 1361, and completed in 1400. The destructive fires of 1829 and 1840, and the restorations by Sir Robert and Sydney Smirke are treated upon, as well as the more recent and intelligent restoration of the south transept under the late G. E. Street. Mr. Brook remarks: "Other English cathedrals are more finely placed, several are richer in ornament, one or two have a more delicately varied outline, but none are so stately and magnificent as York, and there is hardly a church in Europe that appears so vast as the minster viewed from the north." The worst feature of the minster is the weakness of the western towers, which, says the author, closely approach to the ideals of "Churchwarden's Gothic" at the beginning of this century, and other grave defects are the flatness and thinness of the western front, which is overlaid with unnecessary details. The book contains 41 illustrations. "Beverley Minster," the companion work, is written by CHARLES HIATT, who is the author of the volume in this excellent series on "Chester Cathedral," and is also well illustrated. The author writes enthusiastically of the magnificence, stateliness, and grace of the great church, its fine proportions and wealth of carving, including that on the so-called "Percy Shrine," but which, Mr. Hiatt shows, really commemorates Eleanor FitzAlan, wife of Henry first Lord Percy of Alawick, who died in 1328. A short chapter is devoted to the very fine cruciform church of St. Mary, at the other extremity of the otherwise uninteresting town, an edifice which is overshadowed by its sister structure, but which is a magnificent example of an East Riding parish church. Pugin added, in 1856, the huge flying buttresses to the front of the south transept, which was in danger of falling, and the whole building was restored by Sir Gilbert Scott seven or eight years later.—*The Essex Review* (Chelmsford: Edmund Durrant and Co.) contains an illustrated article on Francis Quarles, the emblemist, by E. J. Harry; another on "Troubles at Stisted in 1642," by Miss Bertha Potter; and others on "Famous Essex," "Parish Register Books," and "County Historians."

Much information of permanent value and more than local interest is embodied in the Notes and Queries, which form a feature of this well-edited quarterly.—*Landmarks in English Industrial History*, by GEORGE TOWNSEND WARNER, M.A. (London: Blackie and Son, Limited), is a fairly good summary of the salient features of England's industrial and commercial progress. Mr. Warner has not a very intelligent appreciation of the causes or aims of the Industrial Revolution, nor does he appear in the least to understand the great silent influence which is slowly but surely making for industrial co-operation, which, after all, "Trades Unions Congress faddists and agitators" can do very little to hasten or retard. He might, perhaps, have grasped this in some degree if he had familiarised himself with the fact that down to the days of the recognition of trade-unionism the prices of the necessities used by the workers have always increased in a considerably greater ratio than their wages. He will find the facts which prove this, and have been established by Gustaf Steffen and others, much more reliable than the conclusions of the authorities to whom he has mainly trusted.—*Whitaker's Titled Persons for 1899* gives all the essentials hitherto confined to several expensive volumes, and, in a library binding, is published at half-a-crown.—*Laston's Builder's Price Book for 1899* (London: Printed and published by Kelly's Directories, Ltd., High Holborn). The eighty-second edition of this well-known price-book of the building trades amply justifies the claim of this book to be considered the standard work on the subject, to which in disputed cases in the law-courts reference is made. In this edition several new features are noticed. Electric-lighting has a large section devoted to it. The rules issued by the Sun Insurance Office for electric installations, and those of the L.C.C. for the protection of public buildings from fire, are given. The agreement and schedule of conditions for building contracts, and issued by the Institute of British Architects, is printed in full. Other rules, by-laws, and regulations relating to procedure in cases to be brought before the Tribunal of Appeal under the London Building Act, and the by-laws of the L.C.C. under the various Acts are given in full. The working rules of the building trades of London agreed to between the London Builder's Association and the representatives of the workmen, the regulations in the City and the several district boards and vestries in the County of London, the Metropolitan Water Act regulations and those of the L.C.C., the form of contract with builders issued by that Council, theatre regulations, &c., all find a place. The usual tables and data and classified building advertisements appear in this edition, and the whole is accompanied by a good index.—*Cabinet-Making for Amateurs* (London: L. Upcott Gill, Strand). This is a practical handbook on the making of various articles of furniture, by various authors, edited by Mr. John P. Arkwright. A very useful guide for amateur carpenters and cabinet-makers. The work comprises a large amount of general information on tools, benches, with hints about wood and glue. The amateur who wishes to make a five o'clock teatable, a bookcase, cupboard, a kitchen table, washstand, chest of drawers, overmantel, &c., will find the book serviceable. The various processes are described, and illustrated by diagrams, plans, and views. We do not say anything about the designs—some of the fancy articles are lacking in character and simplicity; but the work will be found full of the kind of information the amateur requires.—*The Municipal Parks, Gardens, and Open Spaces of London: their History and Associations*, by Lieut.-Col. SEXBY, V.D., Professional Associate of the Surveyors' Institute (London: Elliott Stock, 16s.). It is a well-executed attempt to give an account of the municipal parks and open spaces under the control of the London County Council. The story of the well-known Royal parks has been the subject of many volumes, and has been long ago dealt with in these pages; but hitherto no account has been given of these less familiar places, which, in many instances, possess quite as important and fascinating a history. A short description of each space is given, with an account of its distinguishing features, the steps which led to its acquisition, and its previous history, compiled from ancient and modern sources. The latter feature is very fully dealt with, and will be found to contain much valuable information for the historian and the antiquary. In addition to

the ordinary local and county topographies, the author has had the advantage of consulting many private and legal documents which have not been made public before, and which add considerable interest to the subject in hand. Its many illustrations constitute one of the most attractive features of the work. It contains some 185 pictures, including landscapes of the parks and open spaces, and a number of sketches of picturesque nooks and corners, many of which have been specially photographed for reproduction here. To these have been added many illustrations of historical places and scenes connected with or near to the parks, some of which have now vanished; there are also many facsimiles of old prints and drawings, as well as plans and maps of much local value. To make the history complete and to facilitate reference, a copious index is included. An extended introduction, tracing the growth of London's municipal parks and open spaces to their present large acreage precedes the book, and in an appendix is given the list of all the places in London available for public recreation, with particulars as to their size and the arrangements for their maintenance.—*English Country Cottages: their Condition, Cost, and Requirements*, by J. L. GREEN, F.S.S. (London: The Rural World Publishing Company, Ltd., 111, Strand).—This little book, illustrated by numerous plans and elevations of cottages, will be found of service to all promoters and projectors of labourers' dwellings. Mr. Green, the author, has had practical experience of the requirements of agricultural cottages, and has been assisted by many owners of property of this description, including the Dukes of Bedford, of Rutland, of Westminster, Lord Wantage, Earl of Coventry, Earl of Kimberley, Sir Walter Gilbey, and others, who have placed plans and data of cottages on their estates at his disposal. Excepting the cottages on the large estates of noblemen and others, accommodation of this class is very defective. Mr. Green also observes that the model by-laws of the Local Government Board are in most instances undesirable, and that if these dwellings are to pay even 2 per cent. gross on the capital outlay, rents would require to be much increased. The author treats of the subject under several heads. The system of letting cottages with the farms is very common. In Berkshire, Bucks, Cambridgeshire, Cornwall, Devon, Hertfordshire, Oxfordshire, and Shropshire the farm cottages are mainly in the hands of the farmers, who sub-let them—a very undesirable arrangement in the interests of the labourer, who thus has his "work and home bound up together." In many cases there is a condition in the letting that the tenure is to hold only so long as the labourer works for the farmer, and this is naturally resented by the labourer. As to the accommodation, the author says four rooms, two on each floor, is seldom exceeded; while three, and even two rooms are more common. A sad tale may be told of the moral depravity of living, or herding together, under these conditions, the want of drainage, and the means of removing the refuse, &c., the contamination of wells, and the spread of fevers. The overcrowded and insanitary country cottage is a potent cause of immorality, disease, and crime, and are, as the author says, a discredit to the nation. The remarks and suggestions on close and open villages, on rent, rates, and tenure, on cost, drainage, water supply, model by-laws, are valuable and suggestive, and several fairly good types of plans are given, with the dimensions and cost. We recommend Mr. Green's work to all landed proprietors about to build.

#### EDINBURGH: THE TALLA WATER SUPPLY.

AT the Talla Waterworks preparations are being made, says the *Scotsman*, for a vigorous summer campaign of labour at the great reservoir now in course of construction to provide an additional supply of water to Edinburgh. During the winter months the contractors, Messrs. James Young and Co., Ltd., have concentrated their energies on two important pieces of work—the one the completion of the great tunnel on the north side of the reservoir, and the other the construction of a new road up the north side of the valley, to take the place of the existing one on the south side, which, when the reservoir is made, will be submerged. The tunnel is now nearing completion. It is 400 yards in length, 15ft. in height by 13ft. 6in. in width, and its bell-mouth

PART OF HINGE AT C.

in the hill side is faced with granite. The tunnel itself, which has been excavated out of the solid rock, is faced with blue Staffordshire brick. The inlet channel is 40ft. in breadth, and near the mouth of the tunnel are curving walls of red sandstone. The inlet channel begins at a point 100 yards or so above the embankment; the tunnel, with a circular sweep under the hill, passes the north end of the embankment, and debouches below, where the tail of the bank will end. There an outlet channel connects with the bed of the stream again. About April this tunnel will be completely finished, and the whole water of the Talla will be turned into it, leaving the area of the embankment to be dealt with by the workmen, unembarrassed by the running stream. The puddle trench, 40ft. in width, stretches right across the valley. Its excavation was finished last year, but the Talla in one of its floods broke into it. No damage was done, as the trench was excavated out of the solid rock, but it is at present full of water. Immediately the Talla is diverted into the tunnel the water in the trench will be pumped out. An examination of the trench will then be made by the engineers and by Mr. Hill, C.E., Manchester, the consulting engineer to the Trust, and the contractors will proceed to pack the trench with clay and form the embankment. After the reservoir is made, the tunnel will form the outlet for the city supply and the compensation water. Half up its height there are steel joists on which will be laid two rows of 3ft. pipes for the town's supply. The compensation water will run in the bottom of the tunnel, and shafts are being made at present to hold the requisite machinery for the control of both supplies. One of the new buildings is a hospital for eight beds, erected for the benefit of the men by the water trustees. The Talla scheme, it may

be recalled, received the Royal Assent on the May 30, 1895; the first sod for the construction of the railway was cut September 28, 1895, and the contract for the reservoir was signed March 12, 1897.

The plans and specifications for the scheme are by Mr. Wilson, the trustees' engineer, but, in view of the magnitude of the work the trustees employed Mr. Hill, C.E., Manchester, as consulting engineer. The drainage area of the Talla scheme extends to 6,180 acres, and the trustees have purchased the whole of the land from Sir Graham Montgomery and the Earl of Wemyss at a cost of £36,000. Rock has been found at the depth at which it was estimated it would be got—viz., 30ft. to 40ft.—and the trench is carried well into it. The rock is hard and of good quality, and appears to be altogether suitable for a foundation for the puddle-trench. As the outlet will be by the tunnel already referred to, this will permit the embankment to be made in one solid mass, unpierced by pipe or culvert. The estimated capacity of the Talla Reservoir is 2,750,000,000 gallons. The area it will cover will be 297 acres, and the height of the water at the bank of the reservoir will be 950ft. above sea-level. The scheme when completed will give 8,000,000 gallons of water per day for town's supply and four million gallons for compensation. When more water is needed provision is made for diverting the Menzion into the reservoir. The distance from the Talla Reservoir to Fairmile, where the service reservoir will be, is 35 miles, and the contracts for connecting-tunnels and aqueducts are well forward, and should nothing unforeseen occur the scheme will be completed in three years from this date. The estimated cost was £750,000, and although two-thirds of the contracts are let, the estimate has not been exceeded.

## FRENCH DOOR.

THE Door is of oak, in a very dark brown colour, almost black, divided in two portions, which are hinged together by the ornamental iron hinges. There are two mouldings which are very refined and delicate, and add not a little to the very fine proportion of this door. The iron hinges are quite flat, of about an eighth in thickness, having the edges bevelled, and incised lines on face. The key-plate is composed of two plates, the one being a background to the fret, while stuck on the face of this are four square spindles, which add considerably to the plate, the whole being a very fine composition of iron and oak.

J. DOUGLAS TRAIL.

The Cheadle board of guardians have adopted plans prepared by Messrs. Chapman and Snaps, of Newcastle-under-Lyme, for new workhouse infirmary and alterations to the workhouse.

Mr. James Darlington, J.P., has erected at Char-nock Richard, Lancashire, a row of almshouses with caretaker's house, and a parochial room. The architect is Mr. A. E. Tansley.

A monument has been erected in Southampton cemetery to the memory of the late Alfred Jas. Dyer, J.P., by the Ancient Order of Foresters, of which he was the district secretary for 24 years. The monument is 8ft. in height. The plinth is 3ft. 6in. wide, is of grey Yorkshire stone, and from this rises a moulded base and pedestal of Portland stone, which bears an inscription. On a shaped block is a shield carved with the emblems of the order. The whole is surmounted by a canopy, supported by red Peterhead granite columns, having moulded bases and carved capitals. The work has been designed and executed by Messrs. Garrett and Haysom, Eastgate, Southampton.

BALDWIN STREET, BRISTOL. (FOR THE CITY CORPORATION.)

REFRONTING 47, BALDWIN-STREET,  
BRISTOL.

THIS Georgian front, recently erected for a small block of offices in Baldwin-street, Bristol, for the Bristol Corporation, was designed in the drawing office of the city engineer, Mr. T. H. Yabicom, M.I.C.E. The elevation is in Bath stone to cornice-line, first-floor level, above this to transom of window to third-floor level brick facings with Bath stone dressings, the top portion of the building being in Bath stone. The whole of the external woodwork is painted pale Brunswick green. The work has been carried out by Mr. William Church, contractor, of Bristol, Mr. J. Long acting as clerk of works.

The city council of Leeds have appointed a sub-committee to consider the desirability of building new law courts for the borough.

## OBITUARY.

MR. RHYS DAVIES, J.P., the borough surveyor of Brecon—a post he has occupied since 1873—died on Saturday last, aged 64 years. He possessed great gifts as an organiser, being secretary to the Breconshire Chamber of Agriculture, the Agricultural Society, the Horticultural Society, and the County Rifle Association; and also for the local committee of the Eisteddfod. He also found time to effectively discharge the duties of agent for the estates of Earl Ashburnham and Col. John Morgan, the present Mayor of Brecon. As a bard and humorous author, he was widely known as Llew Llywel.

MR. GEORGE ROBINSON, of Lichfield, the surveyor to the Conduit Lands Trust, from which the water supply of that city is derived, died on Sunday week from a paralytic seizure. Mr. Robinson, who was 55 years of age, was the son

of an architect and surveyor at Enville. Upon the construction of the waterworks at Lichfield he was appointed surveyor to the Conduit Lands Trust. During the quarter of a century he had held office the trustees were only once called upon to engage the services of a consulting engineer, and the gentleman so employed expressed his entire approval of the works which Mr. Robinson had carried out. Recently the deceased had been engaged in sinking a new shaft and heading on the Walsall-road, thereby securing for the city an additional water supply of about 400,000 gallons per day, and raising the full supply to about 700,000 gallons per day. His services were recognised by the trustees at a meeting on the 13th inst. by a gratuity of £100, and by an increase of £50 per year in his salary.

MR. BENJAMIN JENKINS, of Brecon, who owned the largest building business in the county, died last week at the early age of 44 years, after a brief illness from influenza followed by pneumonia. Mr. Jenkins was the youngest but one of the seven children of the late Mr. Benjamin Jenkins, of Danywaring, Llangeler, Carmarthenshire. He was born in 1855, and, having been educated at the National School of his native village, was apprenticed at an early age to the carpentry and joinery. When comparatively young he left home, and worked as a journeyman in most of the principal cities and towns of the United Kingdom. In 1877, he commenced business as a builder and contractor in Llanelli. Three years later he secured contracts in Brecon, and then took up his residence there, building large and well-equipped joinery works in the Watton of that town. He employed recently about 120 men, and had carried out many important works, including several church restorations, the erection of many Baptist, Congregational, and Methodist chapels, schools, a convalescent home, and many business premises, vicarages, and houses in various parts of South Wales and the border counties. He rendered good service to Brecon as a member of the town council. He leaves a wife and young family.

## CHIPS.

At a meeting of the Edinburgh Association of Science and Arts, held in the Scottish National Portrait Gallery on Monday night—Mr. George Somerville, the president, in the chair—Mr. John Kennedy read a paper on "House Sanitation."

The new Imperial Theatre, Bordesley, will be ready for opening on Monday, October 2nd. The plans have been prepared by Messrs. Owen and Ward, of Birmingham. The building has two frontages, one to High-street of 104ft., and the other to Clyde-street of 134ft. The circle and gallery are supported on steel cantilevers, thus avoiding any obstruction by iron columns. The auditorium is 69ft. by 65ft., and the stage is 69ft. by 40ft.

Mr. R. A. Rogers, of Newton Abbot, has been elected surveyor and sanitary inspector to the Newton Abbot board of guardians, and architect to the same authority, sitting as a board of guardians, at a joint salary of £200 a year.

The new adult school building at Barton Hill, Bristol, has been opened. Messrs. Cotterell and Thorpe were the architects, and the building has been constructed by Mr. Wm. Church. It consists of a large hall, which can be used as a gymnasium, and three smaller rooms, to be used as laboratory, reading, and refreshment rooms. The hall will hold about 450 people, and the entire building will accommodate about 1,000 people.

At a meeting of Temperance workers held at Dudley, on Saturday, it was decided to pull down the existing Temperance hall, and erect on its site a new institute, from plans by Messrs. Wood and Kendrick.

The town council of Lowestoft are about to improve the North Parade, and continue the marine drive to Gunton Cliff, at a cost of £2,100, and have raised the salary of the borough surveyor from £310 to £350 a year.

New business premises, at the corner of Wine-street and the Pithay, Bristol, were opened on Monday. The buildings are three stories in height, and are faced with local bricks, Bath stone being employed for dressings and cornice. The architect is Mr. Henry J. Williams, and the builder Mr. George Humphreys, both of Bristol. On the opposite corner, the Pithay, a double block of like height has been built, the whole of the frontages being of plate glass separated by freestone piers, so as to provide a maximum of showroom space. For this building Messrs. Gingell and Bond, of Corn-street, Bristol, are the architects, and Messrs. Neale Brothers, of Redcliffe, the contractors.

NEW GOVERNMENT BUILDINGS AT WESTMINSTER.—NEW BANK AT DOUGLAS.—“HOUGH END” HALL, NEAR MANCHESTER.—NEWELS AT SOUTH KENSINGTON MUSEUM.—XLVII. BALDWIN STREET, BRISTOL.—OAK DOOR, FRENCH.

Our Illustrations.

NEW WAR OFFICE AND GOVERNMENT BUILDINGS, WHITEHALL AND WESTMINSTER.

LAST week we described the salient points which distinguish the plans and architectural design of both these important National undertakings, and to-day we publish double-page views and plans of both buildings. Mr. J. M. Brydon is the architect for the larger block of offices situate in Great George-street, overlooking Parliament-square, and having a main return frontage in Parliament-street. Mr. William Young is the architect of the new War Office in Whitehall. Next week we shall give some reproductions of the geometrical drawings.

NEW BANK AT DOUGLAS.

A NEW head office for the Isle of Man Banking Co., Ltd., is about to be erected at Douglas. The site is at the junction of the two principal streets in Douglas—Prospect Hill and Athol-street. The external walls are to be of granite of light-grey colour, from Aberdeen, finely dressed. The interior of the vestibule of polished granite of various colours, and the interior of the public office of Pavenazza marble and mahogany. The floors and partitions are to be of fireproof construction. The strongroom is to be steel-lined on walls, floor, and ceiling. The ground floor and basement are to be devoted to the bank's own requirements, and the upper floors are to be leased to others as offices. The cost of the building, exclusive of site, is estimated at £13,000. The architect is Mr. A. Marshall Mackenzie, A.R.S.A., F.R.I.B.A., Aberdeen.

“HOUGH END” HALL.

CALLED “Hough's End,” but pronounced “Ouse End,” situate at Chorlton-cum-Hardy, near Manchester, was for several generations the seat of the Moseley family. The first Hough Hall was built about 1465 by Jenkyn Moseley, probably in the timber-and-plaster style of the period. Three generations later Nicholas Moseley erected the present hall on the site of the former, and entered business in Manchester goods, which he soon extended, and started a branch office in London to superintend the exportation of goods, and was eventually elected to the high position of Lord Mayor of London in 1599, being knighted by Queen Elizabeth during his term of office. The present hall was erected in the latter part of Queen Elizabeth's reign, and, though of modest proportions, may be considered a fair example of the style of the period. The building is entirely of brick, and stone dressings, comprising a centre portion, with a bay at each end, the walls of which are a little advanced from the main structure. The latter is of three stories, lighted with square-headed windows, divided into lights by substantial stone mullions. The upper structure

is gabled and ornamented with the usual ball ornament of the period. The centre is of two stories only, similar in character, and surmounted by a parapet forming a triple gable. The entrance appears to have been originally by a gabled porch at the east end of the building; but this has since been built up, and its place supplied by a doorway on the south front.

C. HENZELL ASCROFT.

CHIPS.

Fault has been found with the quantity of water at the disposal of the inhabitants of Honiton. Mr. Middleton, C.E., has reported on this phase of the question, estimating the cost of the extension at £2,193 4s. The urban district council are considering his report, and will seek advice from another expert before proceeding further.

Mr. Clarkson, C.E., of Scarborough, has been appointed surveyor to the Filey Urban District Council at the munificent salary of £75 per annum.

The parks committee of the corporation of Manchester have recommended that body to purchase the Brookdale estate, which comprises 45 acres, and is situated in Manchester, with the exception of eight acres in Failsworth, it having been offered at £26,500.

The Bristol and Gloucestershire Archaeological Society decided, on Saturday, to make some excavations at Llanthony Priory, which is about to be absorbed by the Great Western Railway, to verify the foundations, &c., and it was also agreed to excavate for a like purpose at Hayles Abbey.

The Baptist chapel at Orpington, Kent, was reopened on Thursday in last week after extensive alterations and repairs, at a cost of nearly £1,700.

The ceremony of opening the Unitarian church which has just been built in Hunter-street, Kirkcaldy, was performed on Saturday. The building, which has been erected at a cost of £1,105, including site, is seated for 200.

Chancellor Fergusson, at the Carlisle Consistory Court, on Friday, granted an application for the confirmation of the sale by the vicar and churchwardens of Bewcastle to the Carlisle Museum of a Roman altar, which had been found in Bewcastle Churchyard. The altar had been dedicated to Cocidius, by Peltrius Maximus, who was the Tribune at Bewcastle. It was the fourth which had been found at Bewcastle with a similar dedication. Roman altars belonging to a church cannot be alienated without a faculty.

At Playden, Kent, the parish church has just been reopened after having been restored, at an outlay of £900.

The Wadham transept in Ilminster parish church is being restored from plans by Mr. T. G. Jackson, R.A., and in removing the plaster of one of the walls, close to the tomb of Sir William Wadham, an elaborate piscina was disclosed, richly ornamented with the four-leaved flower pattern and other enrichments of the Early Perpendicular style.

Mr. R. H. Picknell, inspector of the Local Government Board, held at inquiry at Dover last week, respecting the town council's applications for permission to borrow £850 for public conveniences, £700 in connection with water supplies, £450 for the extension of the museum, and £7,000 for wood paving.

The general purposes committee of the London County Council recommend that the salary of Mr. Andrew Young, valuer to the Council, shall be raised from £1,250 to £1,500, and that of the statistical officer, Mr. Gomme, be raised from £800 to £900, afterwards rising by two annual instalments to £1,000 a year.

The formal opening of the latest extension of the North Cornwall Railway Company's line took place on Friday. This extension commences at Wadebridge, has a length of 5½ miles, and ends at Padstow town. Its course from Wadebridge is along the western side of the river Camel, and the only noteworthy engineering difficulty encountered was at Little Petherick, in connection with the foundations for a viaduct over an estuarial arm. The construction of the line has occupied about two years, and its cost, inclusive of land and equipment, amounts to about £90,000. Mr. E. Andrews was the chief engineer, and Mr. E. P. Wentworth Shields the resident engineer. Messrs. Curry, Reeves, and Co. were the contractors.

Mr. H. Glynn Warne, of Newton Abbot, at present road surveyor to the Newton Abbot Rural District Council, has been appointed under the Chelmsford Rural District Council at a salary of £200 a year. Mr. Warne is a son of the surveyor of the urban district council at Sidmouth.

New board schools are approaching completion in Barnsole-road, Gillingham, Kent. The architect is Mr. Smith, and the contractor Mr. Woollard.

PROFESSIONAL AND TRADE SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—The members visited on Saturday afternoon four houses now in course of completion at Mortonhall-road. The plasterwork of these houses is exceptionally interesting. The leader, Mr. Harold Tarbolton, architect, who modelled the decorative plasterwork, referred to the difficulty experienced by architects in securing good modellers, and urged the Edinburgh plasterers to assist architects in this matter, as the ability to carry out good work would create a demand for it. The party then visited Grange House.

NORTHERN ARCHITECTURAL ASSOCIATION.—Mr. W. Glover, the newly elected president of this association, has generously offered a sum of 150 guineas towards furthering the objects of the Association. Towards a building to be its home he will give 100 guineas if members will raise 900; for the formation of a library he promises 25 guineas if members will contribute 75; and for a students' prize fund he will give 25 guineas if members will give 75. He further offers to double his donations if members will double their help. This would raise 2,000 guineas for the building, 200 guineas for the library, and 200 guineas for a students' fund, the interest of the latter to be devoted to prizes. Mr. Glover a few months ago presented the Association with a new presidential badge.

At Hooton Park, in the Hundred of Wirral, a new racecourse is being laid out, and the old hall, which has been unoccupied for 30 years, is being converted into a clubhouse. The works are being carried out under the direction of Messrs. Mangnall and Littlewoods, of Manchester, the contractors, who have 130 men daily at work on the grounds and mansion, being Messrs. William Brown and Sons.

Mr. J. Worthington, surveyor to the urban district council of Biddulph, Staffs, died very suddenly last week.

A chapel is being added to the Roman Catholic College at Blairs, N.B., at a cost of £12,000, borne by Monsigneur Teunon, of Liverpool. It will consist of nave and aisles, transepts, and apsidal chancel, and tower and pinnacled spire rising to a height of 150ft. The style is Perpendicular, and the facing material Aberdeen grey granite. Mr. A. Curran, of Warrington, is the architect. Other buildings are being added to the college at a further cost of £28,000. The architect for these was Mr. R. G. Wilson.

For the first time in the history of Southampton, a section of its public streets was lighted last week by electricity, the illuminant having been generated at the station, now the property of the ratepayers. The corporation purchased in 1896, for £21,000, the electric-lighting works from a private company, and the works have been transformed and enlarged by Messrs. Kincaid, Waller, and Manville, the additional buildings being erected by Messrs. Playfair and Toole, builders, of Southampton, under the supervision of Mr. W. G. B. Bennett, the borough engineer. The alterations were commenced from plans by Mr. J. H. Lee, the chief electrical engineer to the corporation, and have been completed under his successor, Mr. F. H. Chaplin.

On Saturday, the Feast of the Annunciation, the Archbishop of York unveiled in Hovingham Church an east window, reredos, and brass tablet in memory of the late Sir William Cayler Worsley. It was designed by Mr. C. Hodgson Fowler, F.S.A., of Durham. The Archbishop and Dean of York then proceeded to the village green, where a cross has likewise been erected in Sir William Worsley's memory.

The Museum of Science and Art at Edinburgh has been presented by Major-General Sir R. Murdoch Smith with several fragments recovered from the Palace of King Darius Hystaspes, at Persepolis. The relics consist of detached portions in sculptured limestone, taken from the debris at the site of the ancient structure; they are portions of a frieze, sculptured in relief, with the leg and cloven foot of a bull, having a band of rosettes underneath.

Mr. Percy Brown, A.R.C.A., an assistant teacher in the Birmingham Municipal School of Art, has been appointed as principal of the Mayo School of Art, Lahore. This is the second occasion on which an ex-student of the Birmingham School of Art has received a high appointment in the Education Department of the Indian Civil Service. Mr. John Lockwood Kipling, C.I.E.—father of Rudyard Kipling—held, for nineteen years, the post to which Mr. Brown has been appointed. All the students of the Mayo School are natives. There are 309 students at Lahore, and 200 at each of the three branch schools at Amritsar, Ludhiana, and Delhi.

NEW BANK AT DOUGLAS.

## EARLY ARCHITECTURE IN WARWICKSHIRE.

MR. J. A. COSSINS, in a paper read before the Archaeological Section of the Birmingham Midland Institute last week on "Early Architecture in Warwickshire," said: Though it cannot be called a work of architecture, the great monolith called the king's stone at Long Compton is the oldest erection by man in stone remaining in the county. Of Roman buildings we have nothing or next to nothing. The oldest fragments of building remaining are very probably some fragments of masonry in the wing wall which crosses the moat at Tamworth Castle and the ground and second stories of the central tower of Wooton Wawen Church. These are of the kind generally called Saxon; but although the well-known arches of the tower at Wooton Wawen have all the most prominent characteristics of that style, it is very probable the church was not built by the great and influential Wagen, from whom the place derives its name, but by Robert de Toner, to whom the Conqueror granted the place very soon after the Conquest, certainly not later than the eleventh century. There are some fragments of wall here and there in some of our oldest churches which may be of a date earlier than 1066, but it is by no means certain that they are so old. There can be but little doubt that for a century or more before the year A.D. 1000 very little building that was not of a slight and temporary nature had been done, for it was very generally believed that the world would come to an end in that year, and in anticipation of the dissolution of all worldly interests many wealthy men had made over their lands and money to the Church. After

the year had passed, with a reasonable allowance for errors in computation, it is not surprising, considering how long church building had been neglected, and how full the coffers of the Church had become, that building in stone began to be general, and that it was carried on with feverish haste. After the establishment of the Norman power, and during the reigns of the first three kings, cathedrals, monasteries, and churches were built in amazing numbers; but the wealth and energy of the nation during the time of Stephen were bestowed chiefly on building castles. During his reign there were founded, and either wholly or partially built, at least 1,500 castles, of which 1,150, it is said, were destroyed by Henry III. How all this building was accomplished in about eighty years, if the population was as small as it is generally supposed to have been, must for ever remain a mystery. There is very little doubt that the Saxons, when they built in stone, made rude copies from the already rude architectural fragments of Roman works, which must have been then very plentiful. But our earliest real Norman work was either done or superintended by masons brought over from the Continent. It was at first rude and simple, with very thick mortar joints, but very soon improved, and very noble and grand works of extraordinary richness were produced. In Warwickshire we have in Bickenhill Church arcade an example of the ruder kind; in Polesworth an arcade as simple, but better executed; and in Beaudesert and Stoneleigh works of extreme elaboration. Of the 288, or thereabout, churches in the county, about eighty-five have remains of Norman work, but there are many more that are of early foundation of which no remains exist that can be recognised

as Norman or earlier; about thirty-five are mentioned in Domesday-book as being then in existence, and it is probable that those belonging to monasteries were not included.

## CHIPS.

A group of cottage houses in course of erection for the Rochdale Board of Guardians, at Middlewood, is approaching completion. Mr. Dryland, of Rochdale, is the contractor.

The London and North-Western Railway Company have let the contract for extensions, making practically a new station at Castle Station, Lancaster, to Messrs. Neale and Sons, Manchester, the amount of the contract being £51,000. The chief feature will be a large island platform, with waiting and dining-rooms, and a new approach, with lifts and other modern conveniences.

The Emperor of Austria has conferred the large gold medal of Art and Science on the Society of Austrian Engineers and Architects in Vienna, which celebrated its Jubilee on Saturday.

At the London Sheriff's Court last week, the case of the Trustees of the Bishopsgate Foundation v. the Receiver of the Metropolitan Police came up for the assessment of compensation. The claim was for £54,893, the value put by the plaintiffs upon a plot of land in the City-road, adjacent to the Eagle Tavern, which had been acquired for the erection of a new police-station. After evidence had been called on both sides, the jury assessed the compensation at £33,166, for which judgment was given.

The new schools, Arlecdon, Cumberland, are being warmed and ventilated by means of Shorland's patent Manchester grates, patent exhaust roof ventilators and inlet tubes, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

## THE TEMPLE OF MUT IN ASHER.\*

SUCH is the title of a well-printed and illustrated volume by two amateurs, Margaret Benson and Janet Gourlay, giving an account of unexpected discoveries made in the excavation of the temple, which throws interesting light on the history of Egypt, and the religious ideas of the people. Prompted by a desire to clear a picturesque site, these ladies found encouragement and help in various discoveries and friends as their labour of love proceeded. These discoveries belong to an epoch which begins with the 12th dynasty. The authors have availed themselves for the historical part of their subject of Professor W. M. F. Petrie's "History of Egypt," Professor Wiedemann's and M. Naville's works, and for the account of religious theories of Professor Petrie's "Religion and Conscience in Ancient Egypt." The photographs are very fine examples of the art, and were done by various friends of the explorers, and the most important were taken by Brugsch Bey.

The Temple of Mut lies between Luxor and Karnak, and its situation is one of the most charming temple sites in Egypt, and a monument on which illustrious Pharaohs have left their record naturally attracted attention, to say nothing of the statues of the goddess which it enshrined. A plan of the temple is given, and the numerous plates of photographs help us to realise the importance, value, and interest of the discoveries. Of course, a great deal of the narrative is taken up with a descriptive account of the excavations in 1895, 1896, and 1897. The plan of the Temple of Mut consists of an outer court, a colonnaded court, and a hypostyle hall, as in other Egyptian

temples. In the excavations of this temple, the second court was found to be of later date than the outer, rows of hollow pots were found, and a magnificent lion's head in black granite. The head measures 3ft. 11in. from top of disk to chin, and if the other parts were equally proportioned, the whole sitting statue would be about 14ft. to 16ft. high. The chapter on "The Religion of Egypt" is interesting. The authors show the difficulties of the subject on account of the immense number of deities, whose spheres of action are often indistinct. The lion-headed statues, as found in this temple were dedicated to Sékhet—one of the sun goddesses. Inscriptions on the votive statues name this goddess "Lady of the Sacred Lake" and "Lady of Asher." The special emblem of Mut is the vulture; indeed, her name, which means mother, is written in hieroglyphics with the vulture. The number of statues in the Mut Temple is described as unrivalled; fragments of 150 statues of the goddess exist round the courts and corridors. A long chapter is devoted to the immaterial entity known as the "Ka." Ideally the Ka body is represented as a statue, and on the stela are sculptured food and prayers in which the Ka takes pleasure. But we leave the reader to pursue these mythical descriptions of Ka and Ba, as ghost and soul, and the scheme of immortality they were typical of. The other chapters deal with the different dynasties and the inscriptions found on the temple. The admirable photographic plates, numbering 30, add much interest to the work, which is well printed.

At a recent Tynwald Court, the town council of Douglas was granted leave to borrow £16,000 to acquire St. Matthews's Old Church and land adjoining, and erect thereon new public market buildings.

## CHIPS.

A group of shops and dwelling-houses is about to be built in Crow-road, Partick, near Glasgow, at a cost of £32,000. Mr. Andrew Duncan, of Dunard-street, Maryhill, is the builder.

Mr. John Hutchison, R.S.A., has just finished in the clay a bust of the late Professor Rutherford, which was commissioned by his students as a memorial for the classroom of the Institutes of Medicine in the Edinburgh University. The sculptor will now proceed to have the bust carved in marble.

A gift by the late Mr. James Backhouse, of Hurworth, has just come to hand at Darlington Hospital, in the form of a copy executed in Rome from the original statue by Signor J. Lombardi, the well-known sculptor, the finding of Moses by Pharaoh's daughter. The group is richly mounted on a base of Sicilian marble, and stands about 5ft. high. It will be placed near the main entrance to the hospital.

The Victoria Hall Company, Aston, have decided to increase the accommodation at the hall by building upon the land in the rear, adjoining Witton-road. Plans have been drawn by Mr. A. Edwards, of Bennett's Hill, Birmingham, for the erection of a large hall, 47ft. by 46ft., cloak-rooms, refreshment-room, small dining-hall, and suite of Masonic rooms. The total cost of the additions is estimated at £3,000.

The Bishop of Rochester unveiled and dedicated, last week, in the chapel of St. Thomas's Hospital, a reredos as a memorial of the late Sir Henry Doulton, a governor and almoner of the hospital from 1876 to 1897. The reredos, presented by the children of the late Sir Henry Doulton, has been designed and executed in terracotta by Mr. George Tinworth. The centre panel represents the Ascension of our Lord, the buildings of the village of Bethany being shown in the distance. The subject of the panel on the right-hand side is taken from St. John xx. 17, and the third panel is taken from St. John xx. 24-28. Underneath is a brass plate bearing an inscription.

\* The Temple of Mut, in Asher. By MARGARET BENSON and CHARLOTTE GOURLAY, &c. London: John Murray.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

## NOTICE.

Bound copies of Vol. LXXV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXI., XXXII., XXXIII., XXXIV., XXXIX., XL., XLIV., XLVI., XLIX., LI., LII., LIV., LV., LIX., LX., LXI., LXII., LXIV., LXV., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., and LXXV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—H. W. F.—G. M. S. (Salford).—L. N. G. Co.—S. P. B. (Belfast).—D. R. and Son.

## "BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Rook," "Vik," "Philomel," "Dalma Lynn," "Niche," "Tudor Rose," "Astragal," "Dachs," "Delia," "Swan," "Nothe," "Casual," "Antony," "Tokio," "Black Heart," "First Attempt," "Arc."

## Correspondence.

## MILLBANK COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—The inclosed, from the Clerk L.C.C., will, I think, interest the competitors in the above. Kindly publish if you think proper, and may I ask you to state that Mr. Dobb does not agree with me as to the interpretation of the money clause? Thanking you for your assistance in this matter.—I am, &c., ROBERT WILLIAMS.

SIR,—Referring to your letters of the 14th, 17th, and 18th instant on the subject of the Millbank Competition, I have to inform you that the points you raise in connection therewith have been considered by the Housing of the Working Classes Committee of the Council, and I am to say that the Committee are unable to agree with your interpretation of the condition of competition with regard to the division of £300.

With regard to the other points raised by you, I am to add that the competitive designs will be on view to competitors at the County Hall, Spring Gardens, S.W., on Friday, the 7th proximo, from 10 a.m. to 4.30 p.m. An opportunity will at the same time be afforded for a perusal of the assessor's award.—I am, Sir, Your Obedient Servant, C. J. STEWART, Clerk of the Council.

R. Williams, Esq., F.R.I.B.A.,  
20, Northbrook-road, Lee, S.E.

Brown Oak House, Accrington, the well-known mansion formerly belonging to Col. John Hargreaves, has been purchased by Mr. George Macalpine, who intends to entirely reconstruct it from plans by Mr. Ross, of Accrington.

## Intercommunication.

## QUESTIONS.

[12216.]—**Thickness of Walls of Churches.**—Can someone who knows the rules of the church building societies say what is the least thickness for the aisle and clerestory walls of a church of five bays in length, and of proportionate height, if a grant is required? The walls to be of coursed rubble.—A. G.

[12217.]—**Sashes and Frames.**—In measuring sashes and frames, how are the dimensions taken? Is there not an allowance to be made in the height, and, if so, what is usual? Will anyone tell me whether 1s. 6d. is a fair price per foot for a 2in. double-hung sash window of the usual kind, with oak sunk sill, and with 12 lights, best lines, and pulleys?—LONDON BUILDER.

[12218.]—**Architect's Powers.**—Can an architect demand the removal of what he considers inferior bricks in a wall, and the substitution of other joists for what he calls sappy timber, the same having been built into the work? Is a contractor liable to the extra cost of taking out and renewal? I see nothing in the contract that requires me to obey. A reply will oblige.—THOMAS.

[12219.]—**Strong-Room.**—I propose to construct a strong-room of granite in large blocks. Is this a suitable material for the purpose, and what are its fire-resisting properties?—C. B.

[12220.]—**Cottages.**—Is there any work published giving plans and estimates of cottages for rural districts? On some estates substantially built cottages of five rooms have been built for £250 or £300 per pair, and these are let as low as £2 10s. to £3 10s. per annum. I should like to know the materials of these cottages, when built, size of rooms, kind of flooring—whether of brick, stone, or wood, garden and outhouse accommodation?—AGENT.

[12221.]—**Arches on the Circle.**—Where can I obtain simple rules for setting out an archway of stone in a circular tower, which will give me the bevells of the joints and the size of stones required for arch, and how to prepare the templates, &c.?—A LEARNER.

[12222.]—**Ferro-Prussiate and B.W. Photographic Processes.**—Would some of your readers kindly oblige me by letting me know how are drawings or copies taken from the originals by above process, or if special ink and specially prepared paper are used? I have a drawing of which I require a large number of copies, and I do not like to have to trace them all. Information on above matter will much oblige.—O'HALLLO.

## REPLIES.

[12210.]—**Scraping Stonework and Marble.**—No doubt the surface or "skin" of stone is removed by any process of scraping or dragging, and is therefore best left alone. Sometimes a wash or two of lime-water may be employed after the surface is cleaned down, and applied to the stonework with a clean brush. The lime should be stirred up well and allowed to slake and settle, and any impurities on surface removed. But I should be inclined to clean down the stone in the usual way, and then treat it with a coating or two of "Fluate," made by the Bath Stone Firms, which will fill up the pores of the stone and form a weather-proof skin. Unless a preservative solution be applied, I should much prefer to leave the stone as it is, with the skin and dirt upon it. The scraping of our stone buildings and memorials has done more to destroy them than anything else. Imagine anything more destructive to a richly-carved building like the Houses of Parliament, a cathedral west front covered with carved work, or an Eleanor Cross—removing not only the "skin," but the precision and tooling of the artist.—G. H. G.

[12215.]—**Right to Pull Down and Rebuild Wall Dividing Two Properties.**—A. had better approach B. in a conciliatory manner, and try to get his consent. A., under the circumstances, might agree to undertake all risk and repair damage sustained by B. or his lessee. In this case, the wall belongs entirely to A., but is subject to an easement by which B. can claim to have it maintained as a dividing wall. A. has power to rebuild the wall, if necessary, and his responsibilities would be to make good any damage or injury that might happen to B.'s premises. It has been held that the dominant owner, A., is responsible for any injury that may befall the servient owner, B., through neglect to repair. Also, that if the party-wall is common to both, either is entitled, if necessary, to pull down and rebuild; but when it belongs to one party and the other only has an easement over it, the owner of the dominant tenement must repair, and he can enter on the land of the servient tenement for the purpose. The rights of building and adjoining owners in London are expressly stated in the London Building Act.—LEX NON SCRIPTA.

The old Disruption Free Church of Dunscore, N.B., has been reopened after alterations and reconstruction, effected at a cost of over £900.

At the Methodist New Connexion Chapel, Truro, a stained-glass window of two lights was dedicated on Friday. The subjects are full-length figures of Faith and Patience, and the work has been carried out by Messrs. Fouracre and Sons, of Plymouth.

The Rochdale Corporation are at present trying another experiment in sewage purification at their farm at Brimrod. The system which is being experimented with is one of the new bacterial systems. The sewage is distributed over a bed of bacteria, in this case 500 square yards in area, and is there subjected to the action of microbes. The cost is declared to be very reasonable. The area of the bed which is being used at the farm during the experiment is sufficient to deal with a substantial quantity of the sewage of the town.

## PARLIAMENTARY NOTES.

**THE DECORATION OF ST. PAUL'S CATHEDRAL.**—On Friday night Mr. Paulton asked the First Lord of the Treasury whether he was aware that, in the process of decorating St. Paul's Cathedral with Byzantine mosaics, black lettering, and stencilling in red paint, the original stonework had been cut away to make room for the mosaics; and whether, having regard to the importance of preserving intact the architectural and artistic features of this great national monument, he would use his influence to assist in having inquiry made into the subject of the injury alleged to be caused in these respects by carrying out the present scheme of decoration. Mr. Balfour replied that the Government had no power either of control or advice in the matter to which he referred in his question, but he felt certain that the great artistic authorities who were concerned in the work of decorating St. Paul's Cathedral, would feel, as everybody must feel, the great importance of preserving the historic structure unimpaired.

**THE METROPOLITAN WATER BILL.**—This measure, introduced by the Government for the purpose of requiring the Metropolitan water companies to supply each other with water in cases of emergency, was considered on Monday by a hybrid committee of the House of Commons. After hearing counsel and witnesses on behalf of the London County Council, who urged that it should be made clear that the Bill should have no permanent effect in the event of there not being purchase of the undertakings of the water companies, the clauses were considered and amended, and the Bill was ordered to be reported to the House.

## CHIPS.

Although the supply of property at the Mart, Tokenhouse-yard, showed last week a slight diminution, the amount obtained for that which was successfully dealt with—viz., £193,694, compared favourably with the figures of the corresponding week of last year, which were £165,987. Rather more withdrawals than are customary were declared in property of the Metropolitan order, but ground-rents found a ready market.

At the Radford Fields Estate, Coventry, a motor-car factory is about to be erected at an estimated cost of £10,000, from plans by Messrs. Harrison and Hattrell, of Coventry.

At the Norwich Consistory Court, a faculty has been granted permitting the sale for £700 to the Ipswich Corporation of a portion of the churchyard of St. Mary-le-Quay Church in that town, in order to carry out a street improvement, by widening a sharp and dangerous corner in Key-street. The purchase money will be devoted to the restoration of the fine Perpendicular church, now in a miserably dilapidated state. Mr. E. Fernley Bisshopp, of Ipswich, is the architect for both works.

The Mayor and Corporation of Carlisle have given instructions to Messrs. W. Potts and Sons, clock manufacturers, of Leeds and Newcastle-on-Tyne, to make and fix a new illuminated dial and clock at the town-hall, fix new illuminated dial and clock at Christ Church, restore Trinity Church clock, and clean the free library and markets clocks, Carlisle. The above work is now in hand.

A Roman Catholic Church of St. Benedict is in course of erection in Castlebar-road, Ealing, W., from the designs of Mr. Frederick Walters. The style adopted is Late English Perpendicular, the building is of stone from the quarries of Bere and Ham Hill, with flint dressings in the plinth and parapet. The great feature of the church will be its nave, 33ft. in breadth.

The parish church of Eastleigh, Hants, is about to be greatly enlarged by additions on the south side, the present building being converted into a north aisle to the reconstructed plans. The plans have been prepared by Sir A. W. Blomfield, A.R.A.; the accommodation will be increased from 270 to 895 sittings, and the proposed outlay is £4,000.

The special sub-committee appointed by the Batley Corporation to bring before the town council a scheme for a new town-hall have considered plans prepared by Messrs. Walter Hanstock and Son, of that town, in which accommodation is shown for a public assembly-hall, a minor hall, council-chamber, mayor's parlour, school board offices, police-court, magistrates' rooms, and police-cells. The architects were instructed to prepare a statement of details giving an estimate of the cost of the erection of the building.

As a temporary measure, a new council-chamber is being built for the corporation of Bristol in Broad-street. It is severely plain in character, is situated on the first floor above new municipal offices, and measures 60ft. by 30ft. Should a more suitable town-hall ever be erected, the committee report that it would be easy to let off the block now in course of erection as suites of offices.

## Building Intelligence.

**BATH.**—At a meeting of the Housing of the Working Classes Committee, held at the Bath Guildhall last week, under the presidency of Mr. T. B. Silcock, the city surveyor, Mr. C. R. Fortune, presented an amended scheme in reference to the proposed forty labourers' dwellings to be erected in the Dolemeads. As a result of the inquiry held by an inspector from the Local Government Board, the rooms in these houses will have to be 8ft. 6in. high instead of 8ft. Some alterations in the drainage system will also be required, this latter making a difference of nearly £300. The increased height of rooms will mean an increase in outlay of £720, and the total cost, according to these amended estimates, will be £9,530. Adding 10 per cent. for contingencies, it was agreed to recommend to the corporation that application be made to the Local Government Board for the loan of £10,500, repayable at the longest possible period. A great improvement will be effected by the erection of these houses, which are estimated to produce a rental of £420 per annum.

**BOSTON, LINCOLNSHIRE.**—A meeting of the free library committee was held the other night to further consider the scheme for erecting a suitable building on the land recently purchased in West-street to commemorate the Diamond Jubilee of the Queen. Two plans of proposed buildings, drawn by Mr. J. Rowell, F.I.A.S., architect and surveyor, were presented. One provided for a one-story building, containing reading-room, library, recreation room, and lavatories, and the cost was estimated at about £1,000. The second plan, which was on a more elaborate scale, was on a three-story building with offices, reading-room, library, recreation room, with a lecture-room on the first floor, and accommodation for the technical classes of the school of art on the second floor. The cost was estimated at about £3,000, apart from the furnishing. The second plan met with unanimous approval, and, with a view to its ultimate adoption, it was decided to appeal to the public for further subscriptions. When the building is completed it is the intention of the committee to ask the corporation to take it over and to adopt the Free Libraries Act.

**CHEDDLETON, STAFFS.**—At the meeting of the Staffordshire County Council last week, a committee reported that they had seen Messrs. Gough and Trollope, of the firm of Messrs. Giles, Gough, and Trollope, of London, the architects for the new county asylum at Cheddleton. Mr. T. M. Rickman, the quantity surveyor, and Mr. Bolton, the electrical engineer, as to the excess of £35,000 on the estimated cost (£164,115) of the buildings, now being erected under contract by Messrs. Brown and Sons, of Salford. They explained that part of the cost, £2,500, was due to providing an adequate water supply, £1,000 for wall-tiling, about £2,000 for extra foundations, and a further large sum for roads, while another £2,000 was due to extra electric-lighting plants, due to the increase in accommodation from 600 to 800 beds, all ordered by a sub-committee. Eventually the report was adopted, and it was decided to borrow an additional £35,000 for the asylum, which will be opened on June 30.

**CHURCH RESTORATION IN SOUTH-EAST LANCASHIRE.**—At a sitting of the Manchester Consistory Court held on Friday, Faculties were granted in respect of applications from the rector and wardens of Christ Church, Moss Side, for leave to take down the old nave, rebuild it, and attach to it a chancel already rebuilt; from the vicar and wardens of St. Peter's Church, Bury, to take down the existing church and utilise the materials in the erection of a new church; from the vicar and warden of Samlesbury Church, to erect a tower with clock and bells, put two outside porches at the doors of the church, and make other alterations, including the re-roofing of the church with oak ceiling; also to take out plain glass from a window in the south transept and replace the same with stained glass in the church at Walmsley; to make a number of structural changes in the church at Longridge; to put stained glass in a window on the north side of the church at Pilling; to make various structural alterations in Woodplumpton Church amounting to a restoration, including the substitution of open benches of oak for the present high-backed pews; to make sundry alterations in St. John's

Church, Blackburn; to erect a reredos of oak in St. James's Church, Briercliffe. The Chancellor also decreed a citation in reference to an application for permission to put a new stained-glass window in the church at Walton-le-Dale.

**DAGENHAM, ESSEX.**—The county borough of West Ham, having acquired the Rookery Farm at Dagenham, Essex, 116 acres in extent, have isolated a space of 3½ acres, on which they have erected a smallpox hospital from designs prepared by Mr. Lewis Angell, the borough engineer and architect. The hospital has the following accommodation: an entrance lodge and offices; an administration block, including the medical officers' and matron's rooms, twenty-eight bedrooms for nurses and attendants, messrooms, dispensary, kitchen, laundry, and other offices; two pavilions containing four wards, each ward 60ft. long by 26ft. wide, also a receiving-room, bath-rooms, nurses' duty-rooms, and sanitary annexes; isolation block for four beds and offices; discharging block, laundry, disinfecting chamber, and mortuary. The hospital will accommodate 44 patients and necessary staff. The materials used are stock bricks, with Portland stone and red brick dressings. The buildings have cost about £17,000, exclusive of site. Messrs. Gregar and Sons, of Stratford, were the contractors.

**EDINBURGH.**—A new theatre is being built at the junction of Iona and Buchanan streets. The auditorium will have two tiers, circle, and gallery, and there will be two special exits to each part of the house. The pit and gallery pay-hatch, both ordinary and early doors, as well as the circle pay-box, all open into, and have communication with, one general pay-office. From the entrance-hall, the floor of which will be laid with mosaic, the grand marble stair will lead up to a foyer at the back of the circle. There will be saloons to the pit, circle, stalls, and gallery. That to the circle will be an octagonal-shaped room with an island bar. A coffee-room is also provided, entered from the circle. The building is to accommodate 3,000 people, and the dimensions are, from curtain-line to back of pit, 70ft.; width of pit, 62ft. The stage will be 40ft. from curtain-line to back wall and 62ft. wide, and arranged to take the largest pieces. The height from the stage to the gridiron will be 53ft.; height from stage to flies, 22ft.; and the distance between the flies 48ft. Externally the building is designed in a Free Renaissance style of the Scotch type, and internally the decoration will be carried out in a similar style. Messrs. W. Hope and J. C. Maxwell, of New-castle-on-Tyne, are the architects.

**EXETER.**—The Governors of the Devon and Exeter Hospital have received the report of the committee appointed to consider whether certain charges of mismanagement were true, and to consider whether there had been unnecessary or extravagant expenditure on the buildings. With regard to the building operations, the committee find that in 1895 a scheme was presented for a new wing, and also for additions to the main building for nurses, &c., and for putting the sanitary appliances into thorough working order. The total cost was estimated at £10,247. Further estimates were made amounting to £4,924. The Governors authorised the Hospital Committee to spend a sum not exceeding £7,000 out of the capital funds of the hospital. The Governors further voted various sums to be expended, bringing up the total authorised to £16,487. But contracts were entered into amounting to £20,367. The committee further state that the building account from November, 1894, to December, 1898, shows that payments were made on account of these works of £24,737. The ex-secretary estimated the unpaid bills—irrespective of the outlay for underpinning the tower—at £5,000, but the committee think that it would be safer to place the amount at £6,000. It was evident, the committee report, that the cost of and incidental to the work done and in hand exceeded the contracts by £10,370, and also the total authorisation of the governors by £14,249. Not having had the assistance of an expert, the committee could not express an opinion as to whether the expenditure had been extravagant. It was also pointed out that by the expenditure the bed accommodation had not been increased, but the Victoria wing was no doubt a valuable addition to the hospital, and other improvements made had brought it into accord with modern requirements.

**KILBARCHAN, N.B.**—The joint committee for the erecting of a new church have accepted tenders. The architect is Mr. W. H. Howie,

I.A., 131, West Regent-street, Glasgow. The church, which will consist of nave, transept, and apse, will cost upwards of £6,000. The present church was erected in 1724. On that occasion the sole contractor was one James Baird, Govan, who took down all the ruinous church except Craigends aisle, and re-erected it at a contract price of about £1,500 Scots.

**PATRICROFT.**—In compliance with the demands of the Local Government Board, the Barton Board of Guardians are erecting a large infirmary at Patricroft, and memorial-stones were laid on the 15th inst. The complete scheme will entail an expenditure of £30,000, but at present the guardians are only erecting hospital accommodation to provide 200 beds, 100 each for males and females, and the necessary administration buildings at a total cost of close upon £20,000. The infirmary is to be built on the pavilion system, and the two blocks and the administration block will be connected by corridors, while the further extensions, imbecile wards, nurses' homes, &c., will be erected on the opposite side to the administration block. Messrs. Worthington and Son, of Manchester, are the architects, and Messrs. J. Gerrard and Sons, of Swinton, the contractors.

**SHOREDITCH.**—The public baths and wash-houses for the parish of St. Leonard, Shoreditch, erected by the vestry in Pitfield-street, Hoxton, were opened on Saturday afternoon by Mr. James Stuart, M.P. The vestry have built on the site which extends to Coronet-street and Bowling Green-walk a dust destructor, electric-light plant, a free library, and the baths and washhouses just opened. The dust is destroyed, and the heat thus obtained is used to drive the electrical machinery and for the purposes of the baths and washhouses. The first-class swimming-bath is 100ft. long by 40ft. wide, and the second 75ft. by 35ft. There are private slipper-baths for 50 persons, and the main bath provides in a balcony and gallery seating accommodation for 600 persons, the dressing-boxes being collapsible, so that when an entertainment is going on they form a panelling for the walls. The smaller bath is fitted for use as a gymnasium in the winter. The architect is Mr. Henry T. Hare, F.R.I.B.A., whose design, when submitted in competition and selected by the assessor, Mr. Rowland Plumble, was illustrated by us in our issue of Dec. 13, 1895.

**SOUTHAMPTON.**—The new buildings for Taunton's Trade School in New-road and Trinity-road were recently opened. The buildings are of red bricks. The dining-room is 20ft. by 14ft., has a wood-block floor, and is capable of accommodating 40 boys at dinner. To the left is the technical instruction room, which also has a floor of wood blocks, and measures 26ft. 10in. by 26ft., with working space for 30 boys. A wide staircase leads to the first floor, providing hat and cloak lobbies and assembly-room; this room is 44ft. by 26ft., and is lighted by four windows on the north side. On the side opposite the windows is a bay with raised platform, which can be reached by a separate entrance from the cloak-room; another flight of steps leads to the second floor, containing three classrooms. The wood-work throughout the interior of the building is stained oak. The old offices have been pulled down, and new offices, with automatic flushing, erected on the south-east of the triangular plot on which the building stands. The cost is estimated at £2,300 (exclusive of site), which works out at £10 per head. The builders are Messrs. Brinton and Bone, of Southampton; and the architects, Messrs. Mitchell, Son, and Gutteridge, of the same town.

**WINCHESTER.**—The great Late Perpendicular altar screen or reredos of Winchester Cathedral, has been completed by the munificence of Canon Valpy, as a memorial to his wife, Jessie Margaret, at a cost of £2,000. The reredos was mutilated in 1538, and one of Elizabeth's Prelates (Thorne) further injured it by cutting away the rich work and pulling down the images. For a long time it remained in this state. Then in the last century came the Classic incongruities of Grecian urns in the niches, the erection of a great gaudy baldacchino, with, in 1781, West's enormous picture of the raising of Lazarus. The urns and baldacchino were removed many years ago; the picture remained in Dean Kitchen's time. The restoration of the screen, its niches, exquisite cresting, and statues of historic personages, Saxon Kings and Bishops, and even post-Reformation worthies, were restored and niched, partly as a memorial of Archdeacon Jacob, and also as a general scheme of decoration on the

ancient lines. There remained but the great central subject, the crucified Christ, and this is now in position, a fine work by Mr. G. F. Bodley, A.R.A. The reredos is now in harmony with the shrine-like coffers of the Saxon Kings, the tombs of Norman and Danish monarchs, and the magnificent shrines of the Bishops. West's picture is replaced by a group of the Holy Family and six statues of female saints. The whole of the carving has been executed by Messrs. Farmer and Brindley. The Queen, who gave a figure of Edward the Confessor, is represented by a statuette in the reredos.

**WARRINGTON.**—The inaugural ceremony in connection with the new works of Messrs. Fletcher, Russell, and Co., in Wilderspool-road, took place last week. The premises cover an area of 12½ acres, and have been erected at a cost of £50,000, including the purchase of the site. The buildings consist of moulding and passing shops, pressing shop, machine pressing shop, smiths' fitting and machine shops, large warehouse, lowering shop, engine and furnace houses, gas-testing department, grinding shop, boiler-house fitted with economisers, offices, store and showrooms. The works have been fitted with the electric light, and amongst the articles manufactured are gas ranges, gas fires, laboratory appliances, mantels, registered grates, interiors, kerbs, and kitchen ranges. Mr. Alexander Neil, vice-chairman of the directors, designed the works, with the assistance as architect of the Mayor of Warrington (Mr. J. E. Wright). Mr. Devonport was the builder, and Mr. Broadhurst the clerk of works.

#### LEGAL INTELLIGENCE.

**APPEAL UNDER THE WORKMEN'S COMPENSATION ACT, 1897.**—*HODDINOTT V. NEWTON, CHAMBERS, AND CO., LIMITED.*—Judgment was given on Saturday in the Court of Appeal by Lords Justices A. L. Smith, Collins, and Romer in this appeal from the decision of Mr. Lushington, Q.C., the judge of the Wandsworth County-court, in an application for compensation under the Workmen's Compensation Act, 1897. As stated in our last issue, p. 408, the claimant was the widow of a deceased workman, who was at the time of his death in the employment of the appellants, who were builders. A stable had been built for the London General Omnibus Company about six months before the time of the accident by another firm of builders, and was occupied by the company. After it was occupied the company's engineer considered that it was requisite to strengthen the structure by putting in iron stays to prevent vibration. The appellants were employed by the company to put in the stays fastening together the columns and girders of the stable. For that purpose three planks were placed on two trestles about 8ft. from the ground, and the workmen stood on the planks while at work. At the time of the accident the deceased man was standing on the planks engaged in assisting to raise up one of the iron stays, when he overbalanced himself and fell off, and was killed. Two questions were raised—(1) whether the building was over 30ft. in height, and (2) whether it was being "constructed or repaired by means of a scaffolding" within section 7, sub-section 1, of the Workmen's Compensation Act, 1897. The height from the ground to the parapet of the building was 28ft., and from the ground to the top of the roof the height was 36ft. The contention on behalf of the employers was that, inasmuch as nothing was being done to the roof, the height of the building must be taken, as in section 5 of the London Building Act, 1894, from the ground to the top of the parapet. It was also contended on their behalf that the building, if over 30ft. in height, was not being "constructed or repaired by means of a scaffolding," the work consisting of alterations to the building, and not repairs, and the arrangement of planks and trestles not being a "scaffolding." The County-court Judge decided both the questions in favour of the claimant, and awarded her £245 14s. as compensation. It appeared that the claimant had brought an action under the Employers' Liability Act, 1880, to recover damages, alleging that the planks and trestles were defective; but the County-court Judge gave judgment for the employers in this action, and then, upon the application of the claimant, the Judge proceeded, under section 1, subsection 4, of the Act of 1897, to settle the question of compensation under that Act. The Judge, as above stated, awarded the claimant £245 14s. as compensation, but deducted from this sum the costs of the witnesses called by the employers in the action under the Employers' Liability Act, 1880. The employers appealed. Lord Justice A. L. Smith, in giving judgment, said the workman claimed compensation for injury he received while engaged fixing some "stiffening" irons inside a stable that had just been finished by another firm of contractors, which the General Omnibus Company, for whom the stables

were built, considered vibrated too much. The defendants pleaded in the Court below, and also on their appeal, that the workman was not engaged on a building 30ft. high being either "constructed or repaired" by the undertaker, and also that the erection he was working on was not a "scaffold." In his opinion, the masters' contention was well founded, and their appeal, therefore, would be allowed. The other Lords Justices concurred.

**BURNS V. MASON AND CO.—A CLAIM FOR DAMAGES.**—This action, which occupied Mr. Justice Grantham and a special jury for three days, was brought to recover damages for injury alleged to have been done to certain goods belonging to the plaintiff's firm, owing to the negligence of the defendants' servants. The plaintiff, Henry Baines, in partnership with George Charles de Wilde and John Burns, carried on a business as vendors of wood pulp for electrical insulation, under the trade name of "John Burns," at 15, Long-lane, Aldersgate-street, and the defendants, Messrs. Mason and Co., were builders and contractors. In August last the plaintiff's firm were in occupation of the ground floor and basement, where a large stock of wood-pulp sheeting, a substance manufactured in America, was stored. According to the plaintiff's case, the defendants' workmen were employed in repairing the upper stories of the premises, and it was alleged that they left a tap running on one of the upper floors, and that the water found its way down to the ground floor and basement, and damaged the stock of wood pulp and rendered it useless. The plaintiff's firm alleged that over 20,000lb. of wood-pulp sheeting was thus rendered valueless. The claim made for the value of the goods so destroyed amounted to £507. The defendants' case was that this claim was a fraudulent one. It was contended not only that it was impossible for any water that had escaped to have done anything like the damage claimed for, but that the plaintiff's firm were asking to be compensated for damage done to stock during a fire in the previous April, and for which they had already been compensated by an insurance company. Mr. Henry Baines, the principal partner in the business in Long-lane, said that at the time of the fire in April there were on the premises 100,000lb. of stock, and it was all damaged by the water used to put out the fire. New stock of the weight of 28,000lb. was then ordered to replace the damaged goods. Cross-examined, he admitted that the wood-pulp sheeting which had been damaged by water might be partly restored by drying. A circular was published with regard to this wood pulp, which represented that it suffered no damage from water. There was a stop-tap on the witness's part of the premises, by turning off which he could have cut off the water supply altogether. It was quite a false suggestion that water had been fraudulently poured over any of the goods. A number of other witnesses were called for the plaintiff's firm. Mr. Jelf having opened the defendants' case, evidence was given that the water supply was only turned on to the premises in question during the hours between 6.15 a.m. and 10 a.m., and the pipe which conveyed the water was of very small diameter. Evidence was given that the ball-cock had been safely tied up the night before the alleged flooding occurred, and the amount of water that did actually escape was very small. After the workmen had gone someone had gone upstairs and pulled down the ballcock. It was also stated that the goods were weighed, and it was found that they were 3,300lb. less than the weight claimed for. The jury found a verdict for the plaintiffs for £50 with costs. Judgment accordingly.

**IS PAINTING FROM LADDERS "REPAIRS BY SCAFFOLDING" UNDER THE WORKMEN'S COMPENSATION ACT?**—*WOOD V. W. WALSH AND SONS.*—This appeal, in which judgment was given last week in the Supreme Court of Appeal, by Lords Justices A. L. Smith, Collins, and Romer, raised the important question—whether the Workmen's Compensation Act, 1897, applies to painters engaged in painting the outside of a house by means of ladders—that is to say, whether the employment is on, in, or about a building which is being "repaired" by means of a "scaffolding," within the meaning of section 7, subsection 1, of the Act. The appeal was from the decision of Judge Greenhow, sitting at the Leeds County-court, upon a case stated by an arbitrator appointed to settle a claim for compensation under the Workmen's Compensation Act, 1897. The claim was by the widow of a workman, killed while in the employment of the appellants, Messrs. Walsh and Sons, painters and decorators, Leeds. The deceased was at the time of the accident employed with other men in cleaning and painting the outside of a house over 30ft. in height at Leeds. The work was being done by means of five or six long ladders. Nothing was going on except preparation for painting and the actual painting. The deceased was standing upon the rung of a ladder, which was resting against the wall, engaged in putting and painting, when the rung broke, and he fell to the ground and was killed. One of the workmen at work had placed a plank with one end resting upon and tied to the rung of one of the ladders, and with the other end resting upon a

window-sill, and stood upon this plank to work, but the deceased man had not used this plank. The claim for compensation was referred to a barrister as arbitrator, under Clause 2 of Schedule II. of the Act, who held that the building was not being "repaired" within the meaning of section 7, subsection 1, of the Act, and that neither the ladders nor the arrangement of the plank resting on the ladder and the window-sill were "scaffolding" within the meaning of that section. He accordingly held that the deceased was not killed while engaged in any employment within the Act, and made his award in favour of the employers, but submitted two questions of law for the decision of the County-court judge—(1) whether the building was being "repaired" within the meaning of the Act; and (2) if so, whether it was being repaired by means of a "scaffolding" within the meaning of the Act. The County-court judge reversed the decision of the arbitrator upon both points, and awarded the claimant an agreed sum of £237 18s. The employers appealed. By section 7, subsection 1, of the Workmen's Compensation Act, 1897:—"This Act shall apply only to employment . . . on, in, or about any building which exceeds 30ft. in height, and is either being constructed or repaired by means of a scaffolding, or being demolished." Mr. C. A. Russell, Q.C., and Mr. Clarke Hall, for the appellants, contended that this was not a building which was "being constructed or repaired by means of a scaffolding" within the meaning of section 7, subsection 1, of the Act of 1897. In so far as these were questions of fact, the arbitrator had decided them in favour of the appellants, and an appeal only lay from him on a question of law. First, this was not "repair." The Act spoke of repair by means of a scaffolding. That was an indication of the kind of repair intended—namely, repair of a structural character and not mere decorative work. It could not be said that merely whitewashing or painting a house was doing repairs to it within the meaning of this Act. Secondly, the repairs, if any, were not being done by means of a "scaffolding." The ladders were clearly not "scaffolding." Nor was the arrangement of the ladder and the plank "scaffolding." The arbitrator found as a fact that it was not. If it were, a plank resting on two ladders, which painters frequently used for whitewashing the ceiling of a room, would be a "scaffolding." Even, however, if this arrangement of plank and ladder could be called a scaffolding, it did not follow that the building was "being repaired by means of a scaffolding," only a small part of the work being done by means of the scaffolding. Because one workman chose to put a plank from the ladder to the window-sill, for his own convenience, that did not bring every workman engaged on the building within the Act. Supposing there was a scaffolding at the back of the house used by bricklayers for repairing that part of the house, and painters were employed by the same master in painting the front of the house, the latter would not be employed in repairing the house by means of a scaffolding. They submitted that the decision of the County-court judge was wrong. Mr. Robert Wallace, Q.C., and Mr. Horace Marshall, for the claimant, contended that the work the deceased man was engaged on was "repair" within the meaning of section 7 subsection 1. "Repair" meant the restoration of the building to its proper condition as fit for use and occupation. There might, perhaps, be painting of such a purely decorative character as to be outside any meaning of the word "repair." But here there was making good the wood and stone-work, and painting the outside to keep it from decaying. There was a restoration of the fabric of the house. The ordinary covenant to repair and keep in repair would include work such as this, so as to keep the woodwork in proper condition. Therefore the building was being "repaired" within the meaning of the Act. Secondly, the ladders used in the work constituted a "scaffolding" within the meaning of the Act. The word scaffolding was used in this Act in its popular sense, and included anything used outside the building for the purpose of repairing it. The suitability of the thing for the purpose was the test. Again, if the ladders were not "scaffolding," the arrangement of plank and ladder was. A small platform hoisted up the front of a house by means of ropes and pulleys, which painters frequently used for painting the outside of a house, would come within the term "scaffolding" in the Act. So also would the arrangement of the plank resting on the ladder and the window-sill. The decision of the County-court judge was therefore right. If this kind of employment was not within the Act, the effect would be to shut out a large class of workmen from the benefits of the Act. The Court allowed the appeal. Lord Justice A. L. Smith said that it was clear that every workman was not brought within the Act, but only certain classes of workmen, and the rest were left outside. The question was whether this case came within the Act. The deceased man was engaged in painting the outside of a house. Ladders were used for the purpose. On one ladder there was a plank with one end tied to the rung of the ladder, and with the other end resting on a window-

## Our Office Table.

ill. The deceased man was not working on that plank. He was on a rung of one of the ladders, when the rung broke, and he fell and was killed. There could be no doubt that the Legislature, when they passed the Act, knew well what was conveyed by the terms "ladder" and "scaffolding." There could also be no doubt that they knew what was conveyed by the terms "painting" and "repairing." Though in some respects section 7 might be a most difficult section to construe, in the present case he (the Lord Justice) did not see the difficulty. Was this house "being constructed or repaired by means of a scaffolding" within the meaning of section 7 subsection 1? First of all, was it being "constructed or repaired?" It clearly was not being "constructed." Was it being "repaired?" The word "repaired" did not, in his opinion, include the mere painting of the outside of the house. The arbitrator had found as a fact that nothing was being done to the building except preparation for painting and the actual painting. Ordinary painting was not repairing. If the Legislature had intended to include it they would have said so in plain language. On the contrary, they had used language which was plain and clear—"constructed or repaired"—and those words did not include painting. Next, as regards the meaning of the word "scaffolding." Was the ladder a "scaffolding" within the meaning of the Act? Who, in his senses, would speak of repairs done by means of a ladder, as repairs done by means of a scaffolding? Here, again, if the Legislature had intended it, they would have said so. They had confined the case to repairs by means of a scaffolding. A ladder did not come within that term. It was then said that the arrangement of the plank and the ladder converted the thing into a scaffolding. That seemed to him to be a question of fact, and the arbitrator had found that it was not a scaffolding. He was not going to attempt to define what was or was not a scaffolding, as he could see that they would have many appeals brought before them raising the question what was or was not a scaffolding. The deceased man was therefore not employed on, in, or about a building which was being constructed or repaired by means of a scaffolding within the meaning of section 7 subsection 1 of the Act, and therefore the claimant was not entitled to compensation under the Act. Lord Justice Collins and Lord Justice Romer agreed.

**THE VALUE OF GROUND-RENTS IN THE STRAND.**—Mr. Troutbeck and a special jury at Westminster, heard, recently, the case of "Hawkins v. the London County Council," a claim for compensation in respect of the compulsory sale of a freehold ground-rent of £150 per annum secured on premises, No. 282, Strand, which form part of the block to be swept away by the Holywell-street improvement. The jury awarded the claimant 31 years' purchase, £4,650, plus 10 per cent. for compulsory sale, £465, a total of £5,115.

**THE END OF THE ABBEY MANSIONS CASE.**—At Westminster Police-court, on Tuesday, Mr. Marsham delivered a judgment on the London County Council summonses against the builder, Mr. W. E. Rickards, in the Abbey Mansions, Orchard-street, case. The magistrate held that a limitation of time stopped the County Council from taking proceedings for the reduction of the height of the building. All the dangerous structure summonses which the County Council had taken out were withdrawn, but as they succeeded in the arbitration under this head, he allowed them 60 guineas costs. Mr. Marsham said that the buildings were no doubt all right now, but they were not at all satisfactory at first.

**AN ABERDEEN ARBITRATION.**—Colonel Bailey, R.E., Edinburgh, arbitrator under the Aberdeen Improvement Scheme Provisional Order, who recently held an inquiry to ascertain the value of a house belonging to Mr. Mortimer, chemist, which is required for the Exchequer-row improvement, has intimated his decision to the town clerk. He fixes the sum of £1,350, which was tendered by the town council, as the value of the property, and Mr. Mortimer claimed £2,218.

**ARBITRATION AWARD AT MARGATE.**—Mr. W. H. Elwell, F.S.I., of the Great Northern Railway and Parliament-street, has awarded £7,400 in the case of "Hatfield v. London, Chatham, and Dover Railway Company," in December and January, a claim by Mr. Charles Taddy Hatfield, of Hartsdown, Margate, for compensation in respect of the acquisition of two pieces of land near Margate Railway Station for the purpose of an approach road. Mr. James Green, F.S.I., F.A.I. (Messrs. Weatherall and Green, 22, Chancery-lane, W.C.) was arbitrator for the claimant. Mr. Robert Vigers, P.S.I. (Messrs. Vigers and Co., 4, Frederick's-court, Old Jewry, E.C.), was arbitrator for the company.

In the case of Edwin Fairchild, of St. Mary's-road, Harlesden, N.W., surveyor, the order of discharge from bankruptcy has been suspended for two years ending Feb. 9, 1901.

MR. ASTON WEBB, F.S.A., well deserves the honour of the Associateship of the Royal Academy, to which he was elected last week, from the refined character of his work as an architect. Born just fifty years ago, the son of the late Edward Webb, an engraver and water-colour painter of considerable repute, Aston Webb was articled, when seventeen years of age, to Messrs. Banks and Barry, and seven years later commenced independent practice. In the same year, 1873, he gained the Pugin Studentship of the Institute, annually awarded, it will be remembered, for drawings and studies of Mediaeval buildings in the United Kingdom. Mr. Webb has taken an active part in the work and development of the Architectural Association, of which he has been a member for two-and-thirty years, and having served its members on the committee, and as honorary secretary and vice-president, he was elected President in 1881-2. He has rendered valuable service of a similar character to the Royal Institute of British Architects, for some years as honorary secretary, and then from 1893 until 1897 as one of the vice-presidents; at present he is a member of Council, and is also on its Prizes and Studentships Committee.

At this particular juncture, when it is understood that the Institute Council are deliberating between two other almost equally eligible members to fill the Presidential chair in succession to Professor Aitchison, they could hardly do better than postpone decision between the claims of Vice-President and Hon. Secretary and nominate Mr. Aston Webb. Among his principal works as an architect are the restoration of the tower of the Augustinian Church of St. Bartholomew the Great, Smithfield, the French Protestant Church, Soho, the Royal Naval College about to be built at Dartmouth, and the selected design for the completion of South Kensington Museum. In conjunction with Mr. E. Ingress Bell, he was the architect of the Victoria Courts, Birmingham, the Royal United Service Institution in Whitehall, and the new schools for Christ's Hospital now in course of erection near Horsham. Most of these important and interesting designs have been illustrated in our pages, and we gave Mr. Aston Webb's portrait in our issue for January 3, 1890.

Writing on "The Law of Fences" in the *Land Magazine*, Judge Steavenson shows that it is altogether unsatisfactory, pointing out that the owner of a fence cannot be compelled to keep it in repair, unless he is bound to do so by a specific agreement, every person being bound to keep his own live stock from straying on to his neighbour's land. This, however, is not satisfactory; for it might imply the necessity of double fences where properties join, each owner finding it necessary to fence in his own stock. Judge Steavenson says that the law can be altered in two ways: first by making a fence between two properties a party fence, and, secondly, by compelling the owner of the fence to keep it in repair. He prefers the former reform, which would bring the law into harmony with the Code Napoleon, and the laws of America, Scotland, and Ireland, he says. By the Code Napoleon every owner adjoining a wall has the power of making it wholly or in part a party-wall by paying to the existing owner of the wall half its value. He would adopt the Code Napoleon in relation to walls and fences, and add a clause from the law of the United States, enabling either party, after a month's notice to his neighbour, to make or repair a fence between their properties, and to recover half the cost from the other party. But the necessity of paying half the value of the fence—of course, including the value of the land which it covers—would require a heavy outlay in some cases, and it seems more convenient to require the existing owner to keep the fence in proper repair.

A widely representative conference in regard to a draft bill for the National Registration of Plumbers was held at the Institution of Mechanical Engineers in London on Friday, under the auspices of the National Association for the Promotion of Technical and Secondary Education. Sir Henry Roscoe, the hon. secretary of the Association, presided, and twenty-three bodies were represented. A draft Plumbers' Registration Bill was considered by the conference clause by clause, and was ultimately adopted with certain amendments, but without prejudice

to the question as to whether any bill was desirable or not. Before the conference terminated the question as to whether such a bill is desirable or not was, however, discussed, and the following resolution was eventually passed by a large majority:—"That, having regard to the division of view manifested at this meeting in reference to the desirability of a Bill for the national registration of plumbers, no further steps be taken in the prosecution of such a measure."

On Wednesday in last week, at the Society of Arts Mr. Philip Dawson read a paper on "Electric Traction and its Application to Suburban and Metropolitan Railways." He said the problem of greatest importance in which electric traction would be a principal factor was the rapid transportation of large crowds to and from their businesses in our cities, and his purpose was to demonstrate the special adaptability of electricity to this service. England was the first to introduce electric traction on railways, both underground and overhead, as instanced by the City and South London and the Liverpool Overhead Electric Railways; but to prove commercially that very much heavier traffic could be handled and much greater distances traversed, and to develop the necessary machinery, was left to America. From a comparison of actual results obtained on the Chicago electric railways and the Metropolitan and District lines in London, it appeared that, whereas the maximum speed of 25 miles an hour was obtained in ten seconds with electric traction, it took 33 seconds to do it with steam locomotives, and that, whilst the electrically propelled train could do the distance of 1,880ft. in 66 seconds, with steam it would take 93 seconds. From the economical standpoint of generating power electricity was, he argued, a cheaper method of operation than steam locomotives, and to that end he quoted a large number of figures giving results.

MR. HENRY PETT, F.S.A., writes from Mount Pleasant, Liverpool, protesting against the decision of the Finance Committee of the corporation of that city to destroy the tower and spire of St. George's Church, "the only piece of tower architecture in Liverpool not absolutely devoid of merit." He urges the corporation to reject the recommendation of its committee, pointing out that the tower and spire can be acquired without any expense to the ratepayers, the church trustees having offered to present it to the town gratuitously; and that it is a prominent and familiar landmark; that in any view of Liverpool from the river it is the principal object which arrests attention, while in itself it is a pleasing architectural relic and a good specimen of the style of building in vogue during the early years of the present century. The architect to the Ecclesiastical Commissioners and other experts have strongly condemned the idea of its destruction as an act of vandalism, and he further shows that detached steeples, such as the Carfax Tower at Oxford, the tower of St. Jacques in Paris, and many others, are examples which may safely be followed. St. George's spire was erected at a cost of £10,000, and the stonework is still in an excellent state of preservation. Its restoration will cause no interference with street traffic, but will greatly add to the ornamentation of this part of the city, and would form, Mr. Pett suggests, a splendid background for a statue of colossal size, should one be erected on the site.

THE architects of Missouri propose to follow the excellent example set by their brethren in the sister state of Illinois, and seek legislative powers for the regulation of the practice of architects. A Bill on the subject has been prepared by the St. Louis Chapter of the A.I.A. The measure provides for the appointment by the governor of a board of five members, one of whom shall be a member of the faculty of the State University, and the other four architects of at least ten years' standing. This board is to hold meetings twice a year or oftener and examine all persons who desire to follow the profession. An examination fee of 15dol. is to be charged and 25dol. for a license. The secretary of the board is to receive a salary of 1,500dol. a year and each of the members 10dol. a day for what time they devote to the business of the board. The salary and fees are to be derived from the persons who stand examinations and obtain licenses. All are required to obtain a license and pay 25dol. for the same; but those now engaged in practice and who can satisfy the board of the same need not be examined. Architects who obtain licenses will

be expected to provide themselves with seals and stamp their plans with the same. Any person practising architecture without a license will be subject to fine ranging from 50dol. to 500dol.

THE city of Lyons has been experimenting with glass street pavements as a substitute for stone, asphalt, cement, wood, or macadam. Since last November the Rue de la République has been paved with devitrified glass. This new product is obtained from broken glass heated to a temperature of 1,250°, and compressed in matrices by hydraulic force. The glass pavement is laid in the form of blocks, 8in. square, each block being cross-hatched into the form of sixteen chequers. These blocks are so closely fitted together that water cannot pass between them, and the whole pavement looks like one gigantic draught-board. As a pavement it is said to have greater resistance than stone, it is a poor conductor of cold, and ice will not form on it readily, dirt does not accumulate upon it as easily as upon stone, and it will not retain microbes. It is alleged to be more durable than stone, and just as cheap.

THE Board of Trade have received information from her Majesty's Consul at Riga that, in consequence of the frequent litigation which has lately attended the shipping of lathwood from that port, a meeting of Riga exporters was held on the 3rd inst. for the purpose of discussing a scheme designed to check the claims for short measurement which are continually being sent in by English buyers. A resolution was adopted by all the firms represented at the discussion embodying the following regulations:—(1) A measurer will be appointed, whose duty it will be to control the measurement of the lathwood to be shipped, to see that the said measurement is correct, and to hold himself responsible to the shipper for correct shipment. (2) The measurer will issue a certificate for each parcel of lathwood shipped, stating the exact measure in fathoms; and this certificate will be attested by the British Consul. (3) The exporters bind themselves to buy only from those dealers who allow the shipments to be made under the control and certificate of the sworn measurer. (4) The exporters bind themselves to sell lathwood to Great Britain only on condition that the buyers accept Riga measurement. (5) The exporters bind themselves not to make any shipment of lathwood save under the control of the sworn measurer and the attestation of the British Consul.

"MACHINERY in Use in Modern Road-Stone Quarries" was the subject of a lecture delivered by Mr. C. H. Darbishire, J.P., at a meeting of the Liverpool Engineering Society held on Friday evening in the Royal Institution, Colquitt-street, Liverpool. He mentioned that as hand-drilling of stone required much labour, many attempts were made to utilise mechanical drills, but so far none had proved so economical as those driven by steam or compressed air, the pneumatic drill being the best suited for the purpose. No machinery had been designed to dress satisfactorily granite into square sets, curbs, or channels. Hands and hammer had still to do this work, but in breaking and riddling macadam machinery could be efficiently employed.

At Plymouth a street improvement is on the eve of completion by the re-erection of the business premises at Pomeroy's-corner, where the frontages have been set back. Mr. H. S. Snell, of Plymouth, is the architect, and Mr. Jenkin, of Devonport, the contractor.

The city council of Canterbury have decided to give notice to the owners to put St. Mary's Bredman's Church, which was reported to be in a ruinous and dangerous state, in repair, and, in the event of this not being done, to pull the church down.

A combination has been arranged between Messrs. Georges Hartog and Co., of Paris, one of the first firms of varnish manufacturers in France, and the French branch of Robert Ingham Clark and Co., Ltd., of London and St. Denis. The company is formed under the French Limited Liability Acts with a capital of 3,750,000 francs in Preference and Ordinary Shares, all of which are privately subscribed for. Monsieur Hartog will be president, Mr. Robert Ingham Clark vice-president, and Monsieur Allard du Chollet and Mr. F. W. F. Clark managing directors. Messrs. Robert Ingham Clark and Co., Ltd., reserve the exclusive control and direction of the manufacture of their Britannia brand of varnishes, which will, so far as France and her colonies are concerned, in future be sold by the French house.

## MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Liverpool Architectural Society. "The New Royal Insurance Buildings," by J. F. Doyle. 8 p.m.

TUESDAY.—Perth Architectural Association. "Ecclesiastical Architecture of the Middle Ages," by Charles J. Menart. 8 p.m.

WEDNESDAY.—Royal Archaeological Institute. "Ritualistic Ecclesiology of North-East Somerset," by J. Lewis André, F.S.A.; and "Influence of Eastern Art on Western Architecture in the 11th Century," by J. P. Harrison, M.A. 4 p.m.  
Edinburgh Architectural Association. "Plaster Work," by H. O. Tarbolton. 8 p.m.

## Trade News.

### WAGES MOVEMENTS.

ASHFORD, EAST KENT.—A settlement has been arrived at between the local builders and the bricklayers and carpenters respecting the wages question. A year ago the builders were asked to grant an increase of 1d. per hour in the wages. Half this amount was accepted by the employees on the understanding that, if trade warranted, another ½d. increase would be granted this year. Application was recently made for the fulfilment of this promise, and the workmen have accepted ½d. increase from June 1, with a similar rise on June 1, 1900.

CHESTER.—The employers of bricklayers, joiners, and plumbers in Chester have notified their men that they cannot concede their demands for an increase of wages, and a strike is regarded as inevitable. About 800 men are affected.

PERTH.—On the 15th inst. the Perth operative painters sent a request to the master painters asking an increase on the present rate of wages of ½d. per hour on town's work and 1s. per week on country work. The present rate of wages is 7½d. per hour for town, while 4s. a week extra is at present allowed for men working in the country. The men asked that the increase should come into force to-morrow, the 1st April, and replies were asked to be returned by Saturday last. A meeting of the operatives was held on Saturday to consider the replies from the masters, but it was intimated that no replies had been received, and it was agreed to adhere to the demands made.

THE PLASTERERS' LOCK-OUT.—Mr. M. Daller, the general secretary of the Plasterers' Union, has issued this week a circular addressed to the trades unionists of the United Kingdom appealing for financial assistance to help the union to carry on the struggle with the National Master Builders' Association.

### CHIPS.

Another discovery has been made of the elm-tree water-pipes by which London was supplied with water some two centuries since. The latest find was unearthed by the electric-lighting company that is opening Great Marylebone-street to lay down electric cables. The bored trunks of elm were in excellent preservation.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied some more of their patent Manchester grates to the Girls' Intermediate Schools, Cardiff.

The new theatre just completing in Station-road, Doncaster, was opened on Monday night by Mr. F. W. Fison, M.P. The theatre has been erected from plans by Mr. J. W. Chapman, managing director. It is constructed to accommodate 1,500 persons.

Mr. Dixon, of Ramsgate, has been elected surveyor to the Walmer Urban District Council at a salary of £150 a year.

The Safety Tread Syndicate, Ltd., have just secured the contract for the supply of their treads throughout all the stations on the Central London Railway.

New board schools are being erected in New Kent-road, and special consideration is being given to the ventilation, which will be carried out on the Boyle system.

In Ockbrook parish church, Derbyshire, on Saturday last, a stained-glass window was unveiled to the memory of the Ven. Melville Horn Scott, Archdeacon of Stafford.

Mr. Birket Foster, the well-known water-colour artist, died on Monday night at his residence at Weybridge, in his 74th year.

The mosaics in two of the quarter-domes at St. Paul's Cathedral are now complete, and the scaffolding has been entirely removed. The subject in the north-east quarter-dome was "The Crucifixion," and in the corresponding dome at the south-east angle "The Resurrection."

# THE BUILDING NEWS

## AND ENGINEERING JOURNAL.

VOL. LXXVI.—No. 2309.

FRIDAY, APRIL 7, 1899.

### LOCAL AUTHORITIES AND BUILDING.

**D**IFFICULTIES and delays are encountered by all provincial practitioners who have to submit their plans to local authorities and to conform to building by-laws. These experiences are every now and then "trotted" out for review, and last week the Society of Architects usefully spent an evening in discussing the experiences of architects in their relations with local authorities—a subject introduced by Mr. Ellis Marsland. Many grievances and hardships were detailed by the speakers, who represented various urban and rural districts. These arise from differences of administration as well as those of the by-laws themselves. The discussion represented various forms of grievance, and they may be put under several heads. (1) Non-approval and rejection of plans; (2) incompetence of local authorities or their surveyors to interpret their own by-laws; (3) discrepancies existing between the regulations of urban and rural authorities; (4) want of a code of by-laws and consequent vexatious objections of the authorities; (5) want of a uniformity of administration; (6) prejudices of committeemen—favouritism. If we analyse these several heads, we find the difficulties resolve themselves into the want of a uniform code of by-laws; want of agreement between urban and rural district councils; their incompetence to interpret by-laws; want of a uniform system of administration.

In the first place, it would be impracticable and undesirable to expect every country town and village to be subject to the same unvarying code of building regulations. It would be, for instance, impossible to require the same stringency in respect of building in small rural districts or villages, scattered and open, that would be necessary in towns like Brighton or Hastings. Such matters as thickness of walls, the use of exposed half-timber framing, regulations as to the setting back of woodwork, window frames, chimney construction, and especially with regard to air space behind dwellings, cannot be settled on a uniform basis. Can we imagine anything more unreasonable as to enforce a rigid rule against open-timber work in a villa or cottage in a rural or seaside resort; or to compel a builder to use solid brickwork when concrete or cavity walls are absolutely desirable, and really may be introduced with more economy and effect, because these things are without the scope of by-laws? And yet we know that at one, at least, rising Kentish sea-coast resort, designs with these features have been rejected, and the architect had, we believe, to abandon his first design. The local material of the district, whether sandstone or limestone, or a brick manufacturing locality, must also be considered in the framing of local by-laws. But although uniformity in all these things cannot be expected or desired, and a large limit of variation or tolerance is called for, certain principles of construction can be adhered to. For example, for walls of brick the same schedule of thicknesses can be enforced for dwellings of certain height and size, the same regulation as to bond or wall ties in cavity walls or open-timber work, the composition of concrete may be the same; the height of rooms, the size of windows, can be regulated, the scantlings of timber can be made uniform. Projecting stories and oriels are perhaps not desirable in crowded towns; but they cer-

tainly lend a picturesqueness to village and seaside buildings, and regulations as to these having reference to projection can be made, so as to be enforced in all similar cases. What we say is that no uniformity is possible or desirable under imperfect codes. A code of building by-laws that does not provide for local material, for hollow walls, for cement or timber-work, and other materials or methods, cannot be conformed to without inflicting hardship on architects and owners. This is only a further exemplification of the principle that a wide toleration is more consistent with uniformity than a narrow restricted, half-hearted, and niggardly policy. One-sided laws are always sure to be broken, and most surely is a code of by-laws that only applies to one set of conditions.

Uniformity might be justly exercised in the administration of by-laws. The complaints that reach us are that in one district the architect is expected to prepare duplicate tracings to deposit; in another we hear a set of working drawings executed on linen had to be deposited—an instance given by Mr. McArthur Butler, who referred to a Northern town; in another instance there was no code of by-laws, but the architect was told the corporation used their own discretion in passing or rejecting plans; then there were underpaid officials who gave varying interpretations, or were not competent to interpret them. As Mr. G. Gard Pye said, one set of by-laws ought to be promulgated for large towns, and another less stringent set for rural districts, and if this rule were adopted there would be a more intelligent uniformity observed than is possible now. The discord that takes place between urban and rural authorities is accentuated by the enforcement of one set of regulations made only for the urban district. The building committee, as Mr. Manning said, was often at fault, and the surveyor was the scapegoat;—there were members who could not disguise their narrow prejudices, and rejected plans of one architect, while passing without objection those of others. The surveyor ought to have authority to examine plans in their initial stage, give his opinion as to the requirements of the authorities, and thereby save time and trouble to the architect. The present administration of local regulations is very unsatisfactory: no recognised system of examination or approval of plans seems to be adopted; the plans are left to a committee for a lengthened period, and then fought over—a procedure happily unknown, as Mr. Ellis Marsland pointed out, under the Metropolitan building regulations. So long as the provisions of the London Building Act are complied with, the owner can proceed; but not so in the provinces—no beginning can be made till the plans have been deposited, and the authorities have passed them, which often means weeks of delay. If the London system was extended throughout the country, as suggested by Mr. Marsland, considerable friction would be avoided. We should not then hear of such an anomaly as that mentioned by Mr. W. Cooper, where the architect had to come to terms with the authorities of two districts whose boundaries overlapped, and who possessed different rules as to thickness of walls and to amount of air-space required. The conflicts arising as to party-wall questions in the provinces call for new legislation. No provision exists, as was pointed out, like that which exists under the London Building Acts, by which the building and adjoining owners can agree as to terms.

The conflicting by-laws have been mainly the result of the want of a general agreement between authorities. Each urban and rural council has had its own way in framing its code of regulations, in utter disregard of adjoining districts. What was previously the custom in a locality, however bad in itself, was retained, in deference to local prejudice. The large owners of

local properties naturally have had a voice in these regulations, with the result that insanitary conditions have been retained in some cases. Back-to-back dwellings, insufficient areas for light and air, are even now to be found in many of the large towns in the North. The question of assimilating the building regulations throughout the country is a difficult one; but the principle of unification must be made the keynote of future legislation. There ought to be agreement in all essential points of construction, but with a liberal interpretation as to those details of building which local variations suggest. A code of building regulations for urban and rural districts must be comprehensive. It should provide machinery for settling all those points as to party-walls, air space, and other matters that are likely to arise, and it should provide for an efficient and speedy system of administration confined to competent officials rather than ill-trained local committees.

### ESTIMATES.—II.

#### EXCAVATION AND DRAINAGE.

**I**N the estimation of Excavator's work, the student will find a knowledge of mensuration, or the measurement of solids, of great value to him. It will be a help to him to be able to grasp mentally the relation of the superficies of a cross-section, as that of a cutting or trench to a cube yard, as, for

instance, a trench, say, 2ft. deep by 1½ft. wide, or 3ft. superficial on cross-section, and 3ft. or a yard long, will represent one-third of a cubic yard, and if 9ft. or 3 yards in length will represent a yard cube. These relationships between depth and width of cutting and length are often useful in enabling him to discover the unit of length that goes to a yard cube of digging, and the number of drain-pipes required in that length. Take another instance: A trench 6ft. deep and 3ft. wide, or 18ft. superficial in section, represents two-thirds of a cubic yard for a length of 1ft., and for a yard run would make two cubic yards. This quantity of digging, filling, and ramming would have to be taken and priced at from 9d. to 1s. 6d. per yard cube for the digging and throwing out, filling and ramming. It is often desirable to separate the items of digging and throwing-out, filling and ramming, especially in foundations for walls, where the earth returned and rammed is a proportionate item of the whole cutting. When the foundations are of concrete a small quantity of soil has to be returned, depending on the depth of concrete. Thus, if it is 3ft. deep by the width of trench (say 3ft.), half the soil excavated

will have to be wheeled or carried away, besides that portion of space occupied by brickwork. If we suppose an 18in. wall, there would be about 9in. left on each side by half the height of trench to be filled in and rammed. So that in the yard run of a 6ft. trench there would be only half a yard cube to be filled in, the other yard and a half being carted away.

To take a trench for a wall 18in. thick above footings—that is, 4ft. deep to bed of concrete and 3ft. 6in. wide, the wall of brickwork would occupy about three-sevenths of the trench or a trifle more, including footings. This portion, multiplied by depth, 4ft. is the quantity of soil to be carted away, and the side spaces, 4ft. by 1ft. each, would represent the part filled in and rammed. The space occupied by concrete (if any) would also be added to the quantity of earth carted away. (See diagram.)

To take an example, suppose the item was as follows:—

60 yards cube. Dig trenches for 18in. wall to average depth of 5ft., trimming sides and bottom, and cart away surplus earth or deposit of same, part returned, filled in, and rammed.

Here the whole excavation and throwing up of the trench has to be taken at so much each yard; next, the wheeling away and depositing the same at so much. Then there is the returning, filling, and ramming of a certain proportion of every yard. These several labours are added together. Let us take the part filled and rammed at, say, two-thirds of a yard:—

Digging trench 5ft. deep, 3ft 6in. wide, and throwing out, per yard	£ s. d.
Filling barrow and wheeling, per yard, 20yds. run	0 0 10
Part returned filling and ramming four-sevenths of yard, say, two-thirds of yard, at 6d. per yard	0 0 3½
	0 0 4
Profit, 10 p.c.	0 1 5½
	0 0 1½
	0 1 7

80ft. run. Strutting and planking to trenches 4ft. wide and 6ft. deep:—

Price at 6d. per foot run, taking 1d. per foot super.

80 yards run. Dig trenches for 4in. pipes, return, fill, and ram:—

Suppose the trench is 2ft. deep, it may be priced at 2d. to 3d. per foot run; or, say 9d. per yard run, to which add, say, 3½d. per yard ramming and filling, say 1s. per yard run. This would allow for about two-thirds of a yard returned and rammed (allowing for pipe). We are supposing here stiff clay; for ordinary soils 9d. per yard would be sufficient.

(ERRATUM.—The last item for drain-pipe excavation, p. 433, should have read as *not* including filling and ramming, the price only being for excavation.)

52 yards run. Dig trench for drains not exceeding 6ft. deep, filling in and ramming:—

The price depends very materially on the soil. We have seen this item priced at 1s. 2d. per cube yard. A yard run of a cutting of the above depth would be about 2 yards cube, allowing a width of 3ft., and would be worth about 2s. 4d. per yard run at the above price.

67 yards run. Digging average 4ft. deep for 6in. drain-pipe:—

Price this at 1s. per yard run.

156ft. run, 4in. glazed stoneware pipes, with socketed joints, jointed in cement and puddled with clay in trenches, averaging 2ft. deep, filling in and ramming.

In pricing this item we first obtain the cost delivered of 4in. socket-drain-pipes, then the laying, jointing, and puddling, and

lastly, the digging and filling-in and ramming.

We may put the several elements down as follows:—

Cost of 4in. drain-pipe, per foot	£ s. d.
Cementing joints and puddling, say	0 0 6
Digging trenches, filling, and ramming	0 0 4
	0 1 1½
Add profit, 10 per cent.	0 0 1½
Say	0 1 3

The price of the best Doulton tested stoneware 4in. London pipes, jointed in cement, within three miles of Charing Cross, exclusive of excavation, is 9½d. per foot run.

67ft. run 6in. drain-pipe, with socketed joints in cement, and puddled in trenches, 6ft. deep, filling in, and ramming.

Add to the above amount 6½d. per foot for 6in. pipes, 4d. more for deeper digging and battering side, profit, &c.; making, say, 2s. 3d. in all. Doulton's best tested stoneware pipes, jointed in cement, is quoted at 1s. 0½d. per foot run, exclusive of excavation.

32ft. run 6in. drain pipe as before, average depth of digging 10ft.

Add to the last item 4ft. deeper digging 4d., and extra throw 3d., for planking and strutting trenches 10d., and profit 1½d.

30ft. run 6in. tested drain pipes (Doulton), bedded all round in 6in. of cement concrete under building, in trench 1ft. 8in. by 1ft. 8in.

Digging and throwing out, per foot run	£ s. d.
Wheeling and depositing	0 0 3
6in. pipes, jointed in cement, bedded in concrete 6in. all round, per foot run	0 2 8
	0 3 2
Profit, say	0 0 3
	0 3 5

20ft. run 4in. best Doulton's drain-pipe inclosed in 6in. of cement concrete, exclusive of excavation.

Price this at 2s. 1½d. per foot run.

Extra to No. 6 bends 4in. diameter.

The price of bend has to be taken extra, deducting the length of pipe it supersedes. Doulton and Sons charge for a 4in. bend 1s. 9d., and for a 6in. bend 2s. 3d.

Deducting 6d. for a foot run of 4in. pipe makes the extra for bend 1s. 3d., to which add labour and profit, say 2d., making 1s. 5d. for each bend.

No. 4.—6in. bends to drains.

Deduct from 2s. 3d. the price of 6in. bend length of pipe, or, say, 9d. This will leave 1s. 9d. for each bend, and add 2d. for extra labour, say 2s.

No. 4.—6in. junctions:—

Put cost of 6in. junctions at 4s. 6d., single junctions 3s. per foot run.

6in. junction	£ s. d.
Deduct pipe	0 3 0
	0 0 9
Laying	0 2 3
	0 0 2
Profit 10 per cent.	0 0 2½
	0 2 7½

For double junctions the cost would be 1s. 6d. more.

Laying No. 2 siphon traps, 4in. diameter:—

The cost of 4in. siphon traps is 3s. 6d. each.

4in. siphon	£ s. d.
Deduct 2ft. of 4in. pipe	0 3 6
	0 1 0
Add extra labour	0 2 6
	0 0 3
Profit 10 per cent.	0 2 9
	0 0 3½
	0 3 0½

No. 2 Doulton's 8in. by 8in. yard gullies with iron grating:—

Price 4s. 6d., add carriage and fixing and making good to drain.

Cost of gully, 4s. 6d., less 20 per cent.	£ s. d.
Setting same in brickwork	0 3 8
Labour connecting to drain	0 2 6
	0 1 0
Profit 10 per cent.	0 7 2
	0 0 8
	0 7 10

A few list prices may be useful:—

In Doulton's list 10in. square yard gullies are priced at 6s., and 12in. square gullies at 8s. 3d. The former is for 4in. outlet. A yard gully with bend for rain-water pipe, 8in. by 8in., at top, with 4in. inlet for rain-water pipe is 5s. 9d.; with cast-iron gratings 9d. extra. A round 9in. gully, with 4in. outlet, is 6s. 9d., and a 12in. round gully for 6in. outlet 11s. 3d.

60 yards cube concrete composed of five parts of burnt ballast to one of ground lime:—

To price this item, obtain the prices of ballast or gravel and lime. These elements may be summed up approximately as follows: To obtain the proportions of ballast and lime 5 to 1, add the cost of 5yd. of ballast to 1yd. of lime, and divide by the whole number of parts. Laxton gives the price of grey lime at 13s. 6d. per yard, and of Thames ballast at 7s. 6d. Taking 5yd. of ballast at 7s. 6d. a yard and 1yd. of lime at 13s. 6d. gives a total of £2 11s. Divide this sum by six gives 8s. 6d., and adding cost of labour and profit, say 1s. 8d., makes a total of 10s. 2d. a yard.

The calculation of the value of concrete, to be accurately made, depends on the void created by the aggregate, and the quantity of matrix to fill it. When lime and sand are mixed together (the matrix), the diminution in bulk that takes place is, roughly, one-fourth. Cement and sand mixed, the reduction is one-sixth.

Mr. Leaning gives the following analysis of the value of a cube yard of lime concrete of 1 part stone lime and 6 parts of Thames ballast:—

6yd. of ballast (one-third sand), 4s. 6d.	£ s. d.
25 per cent. on 9s. for diminution of 2yd. of sand cost	1 7 0
1yd. lime	0 2 3
Diminution of lime, 25 per cent.	0 11 0
Voids in ballast, 15 "	
Total	40 " on 11s. 0 4 4½
	7 2 4 7½
Labour mixing per yard	0 6 4½
25gal. water	0 1 6
Cost of 1yd.	0 0 1
	0 7 11½

## "BUILDING NEWS" DESIGNING CLUB.

A VILLAGE SCHOOL OF ARTS AND CRAFTS.

THE result of this competition is by no means so good as could have been wished, and while we allow that the subject necessitated more than usual skill on the part of those who undertook the working out of the problem, it must also be admitted that the requirements presented no real difficulty, and just now they offer an attractiveness always to be associated with contemporary undertakings. Technical and art schools are being erected in a variety of places, more or less on the lines indicated by the instructions which we issued to our members, and many illustrations of similar buildings have been illustrated recently.

However, we have made the best choice afforded by the drawings received. "Svan" takes the first place, "McGilligan" second, and "Rikki" third. The following are the printed conditions governing the contest:—

E.—A School of Arts and Crafts, to be situated in a country town high-street on a right-angled corner site, with a lane on the return frontage. The façade will face south, and there will be a forecourt 18ft. deep, with villa residences on the adjoining land east of the new school, the next house blank wall abutting on to the site, so that

no windows can be obtained on that side boundary. The width of the school building to extend the whole limit of the frontage, which is 60ft. The depth is 200ft.; but ultimately, a picture gallery is contemplated at the rear, and the entrance must be so contrived to the front buildings as to be available as a corridor-way, 8ft. wide in the clear, to this gallery, which will be 70ft. long by 45ft. wide. A block plan to small scale to show how the completed scheme will be contrived. The land is practically level. The accommodation for the school to provide two large studios 18ft. high, the lower to have a mezzanine gallery along one side, 9ft. wide. Each of the big studios to be 36ft. long by 25ft. wide from back to front, and each having big windows towards the north. There must be two smaller studios with north lights, and one may be contrived as a mezzanine room suitable for a small life class. There is to be a master's room or office on the ground floor. In the basement a modeller's room and a smith's shop with two forges will be needed, 10ft. high, with a wide area back and front for light. The lane frontage may have lights above the pavement level, as the ground floor will be 3ft. above the ground line. Cloak-rooms and lavatory with two basins, and two w.c.'s, one for each sex, will be needed. A model's room to be contrived in the upper studio, with w.c. and lavatory basin. A lavatory and w.c. to be provided for the master. A heating-chamber and coal-place below stairs. A kitchen living-room, with scullery, larder, &c., also in the basement, for the caretaker, whose two bedrooms will be in the upper part of the building. An open-timbered roof to be put over the top-floor studios. The staircase to be in concrete, 4ft. wide. Style, a treatment based on the Renaissance, picturesquely handled in red brick, with Portland stone dressings; roof covered with tiles. Scale, 8ft. to the inch for elevations and section. Plans may be smaller. View sketch wanted.

"Swan's" plan is his strongest point. His elevation is bald and wanting in dignity, the big breadth of plain wall-space in the façade being bald and needlessly severe. This is made the more evident on account of the narrow brick pier at the corner of the front when viewed in strict elevation. The entrance is not sufficiently handsome or appropriate as an approach not only to an art school, but to a picture gallery. Some of the designs err on the side of pretentiousness, which is a greater fault still, and we willingly recognise the good taste in a degree of reserve and simplicity, which a plain design often well illustrates; but "Swan's" doorway, strictly speaking, appertains to a mere workshop or factory. The author has ingeniously worked in his mezzanine floor and bedrooms. His through-way approach to the intended gallery in the rear is good, and the school is not divided by it in the way adopted by some of the competitors. Of course, the plan is not free from faults. One of these is the absence of a private approach to the basement for the caretaker. This could readily have been managed, and the front areas should be reached without having to go down by a step-ladder, or get out of the basement-windows. There is no coal-place in connection with the heating-chamber, or for the living-house. The scullery-window should have been differently placed, seeing that the steps above would block out the light and air. There is no w.c. or yard for the caretaker, and the modelling-room is none too large. The models' room is needlessly important, and is isolated from the life classroom. A mere dressing-box often supplies the only accommodation of the kind provided, and even a screen is made to serve the purpose; but in a small studio every inch of room is often in demand, and in erecting a special building for an art school, a proper provision for the model should be made where funds allow. The mezzanine gallery should be connected with the floor of the studio by a small staircase. "Swan's" drawings are not very finished in style, while the crossing of the lines to all quoins and openings does not improve the effect of the plans.

"McGilligan," the second man, is not very happy in either his plans or elevations this time: the through-way to the picture gallery is not direct, and the general contrivance of his scheme is not good. The waste of space in passage room and landings is a fault. The entrance lobby is ungainly, while the ground-floor studio doorway facing the entry would mislead the public visiting the picture gallery, in a needless manner.

The gallery in the lower studio runs the wrong way, and the upper part of the forge room curtails the area of this studio in a seriously objectionable manner. The basement shops are better than "Swan's," and the caretaker has a side entrance, but his house is not a nice arrangement with the dark passage outside the scullery. The exterior calls for no special comment, and can claim no special distinction.

"Rikki," whom we have placed third, is the author of a rather good plan, and would have secured the second place if the execution of his drawings, and particularly his perspective, had been more up to the mark. The arrangements are straightforward and convenient generally speaking, with a direct through-way corridor. The caretaker has a separate entry, but to reach the kitchen he has always to go through the pantry, and to get into the school he must go out into the street and in at the front door. His bedrooms are approached by a private staircase. The elevation is adapted to the purpose of the undertaking, though the lower windows to the staircase raking with the flights ill accord with the monumental treatment introduced under the scroll pediment above, with the columns and niches to match.

"Thistle" drops to the fourth place this time, for he has not realised a suitable plan or appropriate design. The fenestration is continued round the two main fronts, regardless of the immediate interior arrangements, and in this way the lavatories and w.c.'s, which occupy the principal position along the front on the ground floor, have the same big, tall windows as the studio to the rear. This studio would by no means be improved by these same windows, because of the cross-lights which they necessarily would cause. The entrance to the picture gallery is contrived from the side lane, and not by way of a through-corridor from the front of the school building. The hall is wasteful, and the curved-shaped and domed entrance portico does not accommodate itself to the design very well. "Thistle" spends too much care upon his figures, as compared with the amount of thought illustrated by his plans. This is a matter for regret, but with all his faults he makes a good fourth. "Scruton" trifles with his design when he illustrates it by means of so poor a perspective, while the highly conventional air-balloon trees only serve to render the whole thing ridiculous. The clouds, too, are absurd. His elevation looks too much like a court-house or a small vestry-hall. The treatment, however, is not without dignity, though scarcely appropriate. The absence of a through corridor is conspicuous in the plan, though there is a note showing how two cupboards could be omitted to make way for such a corridor. "Scruton," however, fails to observe that an objection would then follow, because one studio would be located on one side of the public passage, and the second on the other, thus confusing the working of the building needlessly. "Tokio" sends a design which, judged by the elevation alone, is second to none, though we cannot like the rusticated columns to the upper part of the façade in the centre. The cornice, too, if it had been carried through between the end pavilion projections, would have materially improved the architectural effect, and greatly helped the continuity of the porch, which, as it is, looks too much like an individual feature. In a successful design, its parts are so essential to the whole that no one of them can be removed without detriment. The trick of blacking-in only the top range of window-panes to all the openings is calculated to give a fallacious impression, and tends to deceive no one so much as the draughtsman himself. Of "Tokio's" plan there is not so much to complain about, though the length of his studios would be better the other way on, so as to obtain the light from the north side rather than from the end. If this design had been drawn better it would have ranked higher. "Vigornia" makes a central open area in the middle of his school, and provides a sumptuous staircase hall which runs up from the ground floor to the top. The loss of room, too, in corridors spoils the plan, which, however, has been thoughtfully prepared. The elevation is marked by an octagonal turret and flagstaff. Also by a porch with a projecting balcony over the archway. This is omitted on the plan. "Quadrant" has a severe Classical sort of design, the upper floor being divided by Ionic columns 10ft. to 12ft. apart. Two bays have windows, the others have bricked-up openings suggesting a revival of the window-tax. The

plan is very compact, and four floors for the minor parts are worked-in similarly to the design placed first. The scheme is not attractive, however. "Le Nord" makes his elevation something like a board school, and in doing so scarcely touches originality. His plan, though concentrated, fails to economise space in the staircase hall. He is one of the few contributors who have included a lift. "Quercus" has disobeyed our rule as to the size of paper to be used. He thereby spoils his chances for illustration. He mars the effect of his building by putting foreground figures under the angles of the main projections. Had the façade been worked out with better detail, and been more spiritedly delineated, the result of the design would be more satisfactory. The plan is very defective with an exceptionally ugly staircase and landing. "Vulcan" harks back after a Gothic mode, which has worn itself out long ago. "Butts" puts a tower over his porch, and sends an Elizabethan type of elevation with mullioned windows divided by coupled pilasters. The plan is L shaped, extending a long way back upon the site. "Pup" comes in late with a very inky performance, which is distinguished by big windows at the west end of his studios, as well as towards the north. The main entrance is in the lane front. "First Attempt" has yet to be named to complete the list. It is of little use making any attempt if the rules of the competition are not observed. To reach the picture gallery the "First Attempt" must pass through the smaller studio. "Claude" came in too late, arriving after these notes were written. His design is crude and poor. It has no windows whatever in the façade above the plinth.

#### IRON CONSTRUCTION IN DRAINAGE WORK.—X.\*

By T. E. COLEMAN, F.S.I.

AMONGST the different forms of joint that have been recently introduced in connection with stoneware drain-pipes may be mentioned Ernest Smith's patent iron joint for stoneware pipes (see Fig. 155). This consists of an ingenious

FIG. 155.

adaptation of the lead joint ordinarily used for iron pipes. The glazed stoneware pipes are plain butt-ended tubes, with an iron spigot and socket securely fixed at the ends by means of a specially prepared cement consisting of sulphur and precipitated gypsum. It is claimed that this cement is as imperishable as the stoneware, and that the iron spigot and socket cannot be detached without breaking the stoneware. The pipes are sent out with the spigot and socket fixed complete, and ready for laying. The socket is so designed that the pipes are concentric when brought together, and the joint made watertight by caulking a strip of lead around the outer annular space of the socket. Solid-drawn pure lead of the proper width and thickness is supplied ready for use. The pipes are made in 3ft., 3ft. 6in., and 4ft. lengths, so that fewer joints are required than is usually the case in stoneware pipes.

Cast-iron baths, when of good quality and thoroughly well enamelled, provide a very satisfactory fitment. At one time they were almost invariably inclosed within a wooden framing, but self-contained baths requiring no inclosure are now largely used. Sketches of the well-known patent *fin-de-siècle* bath are given in Figs. 156 and 157. It is designed to stand upon a safe or tray of marble, glazed porcelain, or other

\* All rights reserved.

pervious material, the entire bath being uninclosed, so that everything connected therewith is exposed to view. The upper edge of the fitment is finished with a bold rolled rim, whilst the waste and overflow are arranged within a small open recess at the foot so as to be readily accessible. The waste-plug is raised by means of a nickel-plated brass rod passing through the porcelain soap-trap fixed immediately above. The

Fig. 156.

outlet grating (see Fig. 157) may be removed at any time for cleaning and inspection purposes. The overflow is cast on immediately behind the recess, and enters the waste just above the seal of the trap, whilst the taps to the bath are so arranged that every time they are turned on a small jet of water passes down the overflow so that it may be kept in a clean condition.

When a bath is fixed on the ground floor of a building the waste should discharge directly out

Fig. 157.

side, over a trapped surface gully. If preferred, however, the waste may be arranged to discharge just below the grating of the gully instead of over it. An antisiphonage pipe should be provided near the crown of the siphon trap to the waste, and carried through the wall into the open air.

The branch waste from a bath situated on an upper floor should be connected to the external vertical waste, the upper end of which is carried above the eaves as a ventilating pipe, whilst the lower end discharges over or into a trapped gully.

Fig. 158.

In the case of a single fitment, the antisiphonage pipe is directly connected with the vertical waste, as indicated in Fig. 158.

Where two or more baths discharge into the same vertical waste, the branch antisiphonage pipes are connected to a main antisiphonage pipe, which is carried above the highest fitment before being joined to the vertical waste. A typical illustration is given in Fig. 159, where a lavatory basin and two baths are shown connected to one common waste. The main waste discharges into a trapped gully, and is continued above the

eaves, whilst the antisiphonage branches are severally connected to the main antisiphonage pipe, the latter being carried well above the top-

Fig. 159.

most branch before being joined to the main waste-pipe.

Amongst the various sanitary fittings required in hospitals, it is necessary to provide portable baths for the use of patients lying in the wards. Fig. 160 is a sketch of a movable bath mounted upon three wheels, each of which is fitted with

Fig. 160.

thick indiarubber tires, so that the whole may be noiselessly moved from place to place. The small wheel is arranged with a swivel, so that the bath is readily turned in any direction, a convenient handle being arranged at each end. Sometimes a long handle is attached to the swivel wheel, as indicated by the dotted lines in Fig. 160. The

Fig. 161.

bath is finished with a bead or rolled edge, and at the bottom is fixed a large discharge cock. The average dimensions of such baths are 5ft. 6in. long, 2ft. 2in. wide at head, 1ft. 7in. at foot, and 1ft. 9in. deep, but they may be obtained in sizes varying from 4ft. 6in. to 5ft. 6in. long. They are usually made of heavy tinned and enamelled copper, but cheaper baths are constructed of tinned iron or steel.

A shower-bath forms a most refreshing adjunct to the usual slipper-bath. Where economy is the first consideration, a suitable arrangement may be independently provided over any ordinary bath (see Fig. 161). A wrought-iron, polished brass, or nickel-plated shower bracket is fixed over the head or centre of the slipper-bath, and directly connected to the cold-water supply. The shower is regulated by means of a handle and chain attached to the bracket, or by a stop-cock on the supply pipe. Immediately under the

Fig. 162.

shower bracket is sometimes fixed another small bracket, with double or treble-jointed arms supporting a waterproof or mackintosh curtain reaching to the edge of the bath. On using the shower, the movable arms are arranged so that the curtain completely encircles the bather, and prevents any splashing of water outside the bath. After use the bracket arms are folded back so that the curtain lies flat against the wall. A mixing box,

Fig. 163.

with hot and cold water supply, may also be provided in connection with the shower bracket if desired.

Fig. 162 is an illustration of a "canopy" or "hooded" bath designed for fixing without any inclosure. It consists of a cast-iron enamelled reclining bath, with tinned and enamelled copper

Fig. 164.

hood, having 3in. hot and cold water taps, mixing box with controlling taps for shower, spray, and reclining baths. The overflow and waste is provided at the side. For baths of cheaper construction the hood is made of enamelled zinc.

Canopy baths constructed entirely of copper are also frequently used. These are fixed within a wooden inclosure — generally of framed, panelled, and polished mahogany or other hard wood. Baths of this description may be arranged

Fig. 165.

with any or all of the following hot and cold water fittings according to individual requirements, viz:—

*Shower.*—A finely divided stream falling vertically from the top of the canopy.

*Descending Douche.*—A jet of water falling vertically from the top of the canopy.

*Spray.*—A finely divided stream issuing horizontally from the side of the canopy.

*Wave.*—A compact body of water issuing horizontally from a slit or opening at the back of the canopy.

*Sitz Spray.*—A finely divided stream rising vertically from the floor of the bath near the canopy end.

*Sitz Douche.*—A jet of water rising vertically from the floor of the bath near the canopy end.

*Plunge.*—Water flowing into the bath for the purpose of obtaining the ordinary reclining or immersion bathing.

The type of bath known as a "sitz-bath" is shown in Fig. 163. It is found to be of great service in the treatment of certain diseases of the spine, muscular contraction, &c., and is therefore more particularly adapted for hydropathic and medical establishments. These fittings are obtainable in enamelled cast iron, cast brass, tinned and enamelled copper, zinc, or glazed fireclay, and may be arranged with hot and cold sitz spray, sitz douche, back spray, and back wave. The patient sits upon a removable stool placed within the bath, as indicated by the dotted lines (see Fig. 163).

Various other descriptions of baths, such as needle, hot-air, vapour baths, &c., are also manufactured; but they will not be further considered

vertical waste, the upper end of which is carried above the eaves. Fig. 164 is a section through a lavatory basin situated on an upper floor, and

Fig. 166.

placed within a wooden inclosure. It is provided with an exposed standing waste in a small recess at the back of the basin, whilst the antisiphonage

Fig. 167.

pipe from the crown of the trap is taken through the external wall and connected to the vertical waste. Where two or more lavatories discharge

Fig. 168.

here, as they are only required under special circumstances.

Lavatory basins should be fixed under similar conditions to those already described for baths. The wastes from ground-floor lavatories are carried directly outside and arranged to discharge over or into a trapped gully. When fixed on an upper floor they are connected to an external

into the same vertical waste-pipe, the anti-siphonage pipe and its branches should be arranged as indicated in Fig. 159.

It is desirable to so arrange the lavatory that every part is as far as possible exposed to view, and the fitment is now frequently supported on iron, polished brass, or nickel-plated brackets, as seen in Fig. 165. The trap to the waste, together

with the hot- and cold-water supply-pipes, are also formed of similar materials, so that the general appearance of the different parts may correspond with each other. The floor under the lavatory is finished with a safe or tray for the

Fig. 169.

purpose of collecting any splashing or droppings of water.

Figs. 166 and 167 illustrate the well-known patent "Modern" lavatory. An open recess is formed at the back, with a projecting lip of porcelain at the top. The waste-valve is actuated by means of a nickel-plated pull-up rod working

Fig. 170.

in the recess, as shown. The grating over the outlet is fitted with a bayonet fastening, so that on giving it a slight turn it may be removed for cleaning purposes. The water supply to the basin is so arranged that two small orifices discharge directly into the overflow at the back,

Fig. 171.

whilst similar jets impinge upon the grating, so that both are constantly cleansed. The remaining openings deliver the water into the basin in the ordinary manner.

Where a range of lavatory basins are required—as for hotels, clubs, railway stations, &c.—each fitment should be separately trapped before discharging into the main waste. Fig. 168 is a

Fig. 172.

sketch showing a range of three lavatory basins supported on brackets. At the upper end of the main waste a brass screw-plug is fitted for inspection and cleansing purposes. The trap at the outlet of each basin is provided with a branch siphonage pipe connected to the main anti-siphonage pipe which is then carried through the wall and connected to the external vertical waste

pipe in the usual manner. Fig. 169 is a section through one of the basins showing the general arrangement of the waste and anti-siphonage pipes.

Lavatory basins are frequently provided with additional fittings for shampooing purposes. Fig. 170 shows a simple form of hinged shampoo-bracket (which may be of polished brass, gun-metal, or nickel-plated), with finely perforated rose for shower, including hot and cold-water taps, and mixing-box complete. Similar brackets, giving both shower and douche at pleasure, may also be obtained.

The traps to baths and lavatory basins are usually constructed of lead, cast iron, polished brass, gunmetal, or nicked plated, according to the nature of the finishings required. Fig. 171 is an illustration of a polished brass trap fitted with cleaning-eye and union for vent or anti-siphonage-pipe. A cast-iron trap, with socket-branch for ventilating-pipe, and suitable for wash-up sinks, baths, &c., is seen in Fig. 172. It is provided with cone inlet, brass grating, and solid plug, together with screw cleaning-eye. The outlet may be of S or Q pattern, to suit local requirements.

#### NEW STATION, CITY AND SOUTH LONDON RAILWAY, LOMBARD STREET.

[WITH ILLUSTRATIONS.]

THE underpinning of St. Mary Woolnoth Church, including the construction of this railway station immediately below the sacred edifice, is an engineering feat of very great interest and considerable skill, carried out in the heart of the City of London, in the midst of continued traffic without interfering with the business of the adjoining thoroughfares. The church is at the junction of Lombard-street and King William-street, and faces the open space in front of the Mansion House. The great change thus carried out has gone on unknown to the man in the street, who has had little knowledge of what has been effected under his feet. The following account has been sent us by the architect of the new buildings forming an approach to the underground station, Mr. Sidney R. J. Smith, and we are enabled to give a view of this part of the work and also the engineer's sectional drawing illustrating how the underpinning of the church has been managed. Sir Benjamin Baker, K.C.M.G., Mr. David Hay, and Mr. Basil Mott are the engineers, and Messrs. John Mowlem and Co. are the contractors. Mr. Sidney Smith's building is to be in Portland stone, with a granite base. The new screen wall is carried along to the front of the west wall of the church to hide the roof of the station. The wrought-iron gates and screen facing the entrance of the church are in character with it. The booking-halls and waiting-rooms are under the road and church, as seen by the accompanying plans and section. The radical change which has thus taken place in the construction of the old City church is rendered necessary by the extension of the City and South London Railway northwards. In 1893 the railway company obtained an Act of Parliament to construct an extension of their line which at the present time runs from the Monument to Stockwell. This extension was to carry them northwards to the "Angel" at Islington. The plan was to cross the river by another tunnel on the east side of London Bridge, to proceed up King William-street—always, of course, at a considerable depth beneath the surface, for this is a deep-tunnel railway—past the Bank of England, up Princes-street, then by way of Moorgate-street, Finsbury-pavement, and the City-road towards the north, terminating at a spot near the Agricultural Hall; although, doubtless, at a future time, powers would be sought to carry the line beneath the High-street, Islington, so as to bring it in touch with the North London Railway at Highbury Station. Stations were to be made at London Bridge, Moorgate-street, Old-street, the City-road, and the "Angel." The Lombard-street station is situated right under the church. The Act of 1893 gave the company power to acquire the Church of St. Mary Woolnoth, to pull it down, and construct the station upon the site. The works, however, were not commenced within the time allowed in the Bill, and an extension of time was sought for in the year 1896. Parliament then imposed the condition that the church was to be upheld, but gave the company the right of using the sub-soil and constructing their station underneath

the church. A section of the church, showing the girders for supporting the walls and the four groups of columns is given herewith; also a plan at the station floor level, and the bedplates and foundations for the stanchions supporting the main girders. The large shaft is 73ft. 6in. by 24ft., and in this will be placed electric lifts together capable of accommodating about 350 passengers. The two station tunnels under King William-street are 21ft. in diameter, and are lined with cast-iron rings. They are for the up and down lines and platforms, and are constructed about 100ft. below the street. These are shown. Both platforms are approached by stairs from the passages communicating with the bottom of the lifts shaft. The work of supporting the church has been accomplished without the slightest damage of any kind to the structure. In carrying out the work the four main girders, designed to support the four groups of columns which carry the roof, were fixed in position, and small needle girders were then threaded through the bases of the columns. On piercing the bases for this purpose, however, it was discovered that the heart of the work was not of solid stone as had been believed, but of a very inferior description of brickwork, with only a casing of stone from 6in. to 9in. thick. It was therefore found necessary to place a continuous sheeting of steel joisting under the whole area of the bases, to tie the loose mass of brickwork together and equally distribute the weight upon the needle girders. This proved to be a very tedious operation, as only a very small part of each base could be attacked at a time. The steel joisting underneath the bases is shown in the section. Having completed this part of the work, the south wall on the King William-street side was next undertaken. The wall was pierced at intervals of about 5ft., and strong needle girders were fixed through the wall, one end resting on the solid stone on the outside, and the other tied down to one of the main girders supporting the columns. Sufficient of the inside of the wall was then cut away to allow of the girder (which had been built before the needles were fixed) being slid into position, and to allow of a 14in. blue brick wall being built, carrying short lengths of bearing girders, which were wedged tight up to the needles. The object of this was to reduce the overhang of the needles, when the outer portion of the wall should be cut away, as no reliance could be placed upon the old work. After the inside girder had been fixed, steel wedges and packings were inserted between the top of the girder and the needles, the wedges being driven up tight to insure that the whole of the weight was being carried by the girder and the blue brick wall before referred to. As the girder was designed to permanently carry only half the wall, it was assisted by timber packings below. After the wall had been pinned up above the girder, and everything made solid by grouting, the work of fixing the outer girder was comparatively easy. The outer half of the wall below the needles was cut away, care being taken not to jar the structure any more than necessary; and the girder, which had meanwhile been built, was moved into position on its bearings. The whole of the weight—roughly about 350 tons—was then taken by the two girders, and as the timber packings under the inner girder were removed, the folding wedges below the needles were driven up to take up the deflection as the weight came on. When the wall under the girders was cut away, the blue brick wall was left in and supported on the lower flanges by cross joists at intervals, the spaces between the wall and the webs of girders being filled up solid with cement grout. For supporting the north wall on the Lombard-street side, the same method as that adopted for the south side was not possible, as in this case the work could not be taken in hand from the street. One main girder was, therefore, designed to carry the whole weight; but as it could not safely be placed far enough under the wall to be in a position to do this, suspended needles were attached to support the outer part of the wall, the tail ends being tied down to one of the girders for supporting the roof columns. In carrying out the work much the same means were adopted as on the south side. Needle girders were fixed just below the church floor level, under cover of which the wall was cut away to allow of the girder being fixed. After the wall had been securely pinned up above the girder, the suspended needles were put in, one at a time, and the intervening masonry held up by cross steel joists placed on top of needles. The deflection of the girders has in every case been

taken up by a system of folding steel wedges, which were driven up as the old foundations were cut away, and the superincumbent weight taken by the girders. Grouting under air pressure has been largely employed in the work, especially in filling up any interstices between the girders and the old masonry, and the success of the operation has been in a great measure due to this. The girders are supported on steelwork stanchions resting on large bedplates formed of steel joists and plates, placed on a bed of concrete of a minimum thickness of 3ft. All the girders, stanchions, and bedplates are filled in solid with breeze concrete and grout, and will, further, be cased in the same material outside to guard against any deterioration through neglect of painting in the years to come. The oblong shaft shown will be lined with cast-iron segments for a depth of 52ft. from the top; and the remaining 28ft., in which will be formed the entrances and exits to and from lifts, will be lined with brickwork. Cast-iron struts will be placed in the positions shown every 8ft. in depth. The church will be restored—with, of course, the exception of the crypt—as when possession was obtained of the building, and within the church it will, we are informed, be impossible to know that any alterations have been carried out below.

#### A FLOOR FIRE TEST.

A VERY instructive floor test was lately made by the British Fire Prevention Committee, whose valuable researches in obtaining reliable data as to the resistance of various building materials and systems we have on previous occasions referred to. In this case the test was of a floor by the Expanded Metal Company, Ltd. The official report of the committee states that the object of the test was to record the "effect of a smouldering fire of 15 minutes' duration of a temperature not exceeding 600° Fahr., followed by a fierce fire of one hour gradually increasing to a temperature of 2,000°, followed suddenly by the application for three minutes of a stream of water, and the consequent rapid cooling." The floor was 10ft. square, and loaded with 140lb. per square foot, and the time allowed for the drying of the floor was three months. The report gives plans, and sections, and details of the floor, from which we find that three rolled steel joists, 6in. deep by 3in. wide (14lb. to the foot) were placed across the chamber north and south, resting on a 4½in. set-off. The two outer joists were placed 1in. from the east and west walls, and the distance between the three joists was 4ft. 9½in. centres. The centring of 1in. boarding was fixed, and on this the expanded metal was laid, 3in. mesh, ½in. by ½in. strand, overlapped 18in. at the centre; the concrete floor was of Portland cement, with 1 cubic yard of furnace ash or cinder to pass through a 1½in. ring. The ash was covered with four sacks of cement, and the mass turned over dry three times, one-fourth part of this concrete being mixed at a time. After being well mixed the concrete was laid on centring and spread over with care, and then trodden down. It was 3in. thick. Its upper surface was cemented. After the centring was taken down, about fourteen days after the concrete was laid, the expanded metal for the ceiling was put up, according to the system of the company, the bars being ½in. by ½in. thick, placed below the joists 12in. apart, supported by steel clips secured to bottom flanges. The metal lathing is the ½in. mesh of Siemens-Martin steel. The ceiling was then plastered with coarse stuff ½in. thick below the expanded metal, with 1 of lime to 2 of sand, with long, well-beaten hair, 1lb. to 3c.ft. of coarse stuff. Other details of the completion of the floor and roof, also the temperatures from the time of completion of structure, December 6, 1898, to February 14 of the present year are given. The log of the test is minutely detailed from the time the door was closed and sealed with fireclay till the shutting off the gas. Observations taken from four pyrometer points are given, and the results are recorded automatically per diagram. We have no space to give these several results, but the summary of effect as given is: "The plaster ceiling below the floor remained intact until the application of water. There was a slight deflection of floor and ceiling. The concrete of floor slightly and superficially cracked. The fire did not pass through the floor." These results show the fire-resisting character of the

CENOTAPH IN SIDMOUTH PARISH CHURCH.

HARRY HEMS AND SONS, Sculptors, Exeter.

Expanded Metal Company's floor, and prove that under these severe tests, and the application of water, the floor remained intact and impervious, only that portion of the ceiling gave way that was struck by the jets of water. We recommend all interested in floor construction and the resistance to fire offered by expanded metal imbedded in concrete to obtain the committee's report, from which we have derived the foregoing facts. The pamphlet is entitled "Fire Tests with Floors," edited by Mr. Edwin O. Sachs, the chairman of the committee, and is published by the British Fire Prevention Committee, whose offices are in Waterloo-place, Pall Mall. Well authenticated tests of this kind are much needed by the profession, and this committee are doing a serviceable work in publishing a series of useful reports on the subject of fire-resisting construction. Those who have introduced fire-resisting floors are justified in availing themselves of reliable records. Facts, not opinions, are asked for by the public and the professional man.

## CENOTAPH IN THE PARISH CHURCH, SIDMOUTH.

A RICHLY sculptured cenotaph of marble and alabaster has been erected in Sidmouth parish church to the memory of the late Mrs. Vallance, of Brighton. The figures of Faith, Hope, and Charity are carved in the round. Messrs. Harry Hems and Sons, of Exeter, have carried out the work.

## INCORPORATED INSTITUTE OF BRITISH DECORATORS.

THE recently incorporated Institute of British Decorators held their first annual general meeting at Painters' Hall, Little Trinity-lane, in the City of London, on Thursday, March 23rd. Members from all parts of Great Britain and Ireland attended this meeting, the primary object of which was to formally elect the General Council, in which is vested the management of the business and affairs of the institute.

Mr. J. D. Crace, of Wigmore-street, London, was duly elected President of the institute; Messrs. Thomas Bonnar of Edinburgh, George G. Laidler of Newcastle, Alexander G. White of Liverpool, J. C. M. Vaughan of Hereford, Robert J. Bennett of Glasgow, and Henry Gibson of Dublin were appointed Vice-Presidents of the Institute, and Messrs. William Allon of South Shields, William Brown of Dundee, Charles Carlton of Glasgow, James Clark of Edinburgh, M. Cowtan Cowtan of London, M. E. Dockrell of Dublin, Isaac H. Donaldson of London, David Laing of London, John McIntyre of Dublin, Thomas Preston of Burnley, John Ratcliffe of Bolton, John Scott of Glasgow, James Sibthorpe of Dublin, John Smith of Sheffield, William G. Sutherland of Manchester, John Taylor of Birmingham, and H. John Whyte of Aberdeen were appointed Members of the General Council.

Mr. I. Hunter Donaldson, the present Master of the Worshipful Company of Painter-Stainers, in whose hall in Little Trinity-lane the institute have their headquarters for the time being, at the opening of the proceedings addressed, in the name of the Painters Company, a few words of cordial and sincere welcome to the members of the institute, wishing them a full realisation of the hopes on which they had constituted the institute.

Mr. John Dibble Crace, the President, then addressed the meeting as to the progress made by the institute since the meeting of the provisional council in February last, and it was stated that 174 decorators had become members of the institute, and that in addition upwards of 60 applications for membership had been received by the secretary, and would be brought up for consideration and election at the meeting of the General Council, to be held at the close of the annual general meeting.

Several matters of interest were brought to the notice of the meeting by the President, including the question of the admission of women, if duly qualified, as members of the institute; and it was the general opinion of the meeting that, if qualified, they ought to be admitted.

A further question of subdividing the institute

into a larger number of districts than at present was also considered; but it was thought that further inquiry should be made, and reports were invited from the various local associations.

The President then invited the members present to express their views as to the expediency of compelling applicants for admission as members of the institute to submit to an examination before being admitted to membership; and pointed out that, in his opinion, to insist upon such a test would be to kill the institute at the very start, for it was obvious that men who had been in business for many years, and who were of established reputation, would not submit themselves to examination as a condition of admittance to an institute only in its infancy. The President further stated that all applications for admission to membership of the institute would have to come before the General Council for election, and every applicant would have to be nominated by two existing Fellows of the institute, and that every care would be taken, both by the General Council and by the Fellows nominating, that no unsuitable persons should be elected; and that—at any rate, for the present—this should afford the institute a sufficient protection against the admission of unsuitable members.

Several members present expressed themselves as of this view.

At a meeting of the General Council which was subsequently held, new members were elected to the number of 56, of whom 44 were elected as Fellows and 12 as Associates. Several of the leading decorators in London have applied for admission to the institute since the meeting was held.

## BOOKS RECEIVED.

*The London Water Supply*, by ARTHUR SHADWELL, M.A., M.B.Oxon., Member of the Royal College of Physicians. (London: Longmans, Green, and Co.)—The author of this book writes for the information of all customers of the Metropolitan water companies, especially for those who desire to be posted in the facts and details of the question as to whether it is desirable for the London County Council to acquire the property and control of these undertakings in the interests of the public. As our readers are aware, the question is now before a Royal Commission to obtain evidence to be able to report to Parliament, and Bills for the purchases of the companies are being prepared, and others are deposited by the companies themselves. Mr. Shadwell gives a full and comprehensive view of this important question; he traces the origin of the water companies; deals with the growth of the supply; compares London with other towns. The future supply, the East London supply, the question of public control are discussed. The author appears to favour the view of the inadvisability of purchase. He points out that the adoption of the Welsh scheme of supply has militated against the L.C.C.'s purchase settlement. The Council are committed to a gigantic scheme, which has, the author says, increased the distrust of a large section of the public. Again, authorities outside the County of London are ignored, and they are only permitted to make terms as they can afterwards. The author summarises the views of these outside authorities, the gist of them being that it is not desirable that the water companies' undertakings be purchased, many being content to remain as they are in the hands of the companies. Again he observes: By the County Council's ever-impending but never-realised purchase of the water supplies, and by their opposition to all new works by the companies, the public have suffered. Mr. Shadwell puts the question very clearly before his readers. He thinks the control of the Local Government Board might be extended in regard to the sources of supply and in respect of the treatment of water before delivery; the Government might intervene to protect surrounding country districts whose supply is threatened by London by the sinking of wells and exhausting the springs. The author suggests in short an amalgamation of the companies with Government control as meeting all the present difficulties. We advise all interested in this pressing public question to read Mr. Shadwell's book. The appendix contains facts, reports, and estimates of various schemes.—*The Cornish See and its Cathedral* (Truro: Heard and Son; and London: Hamilton, Adams, and Co.) is a second edition, revised and enlarged, of a paper-covered handbook to Truro Cathedral,

published by authority of the Dean and Chapter. It is illustrated by reproductions of some fifteen photographs, and contains well-written historical and architectural notes on the old church and new cathedral, the late Mr. Pearson's work being treated of appreciatively. The little handbook is disfigured, however, by a lack of expert revision of the proofs, especially in the matter of small letters for the names of the styles. Now that a tender has been definitely accepted for building the nave, the guide will attract attention, and ought to result in a liberal response to the appeal made on behalf of the building fund. As completed, Truro Cathedral will be, it seems, almost equal in size to Rochester, containing an area of 23,200sq.ft., against the 23,300sq.ft. of its ancient North Kent sister, and will be larger than Bristol, which, including G. E. Street's new nave, only covers an area of 22,556sq.ft.—*Dilapidations: a Textbook for Architects and Surveyors.* By BANISTER FLETCHER, Professor of Architecture, &c., King's College, F.R.I.B.A., &c. Fifth edition revised and enlarged. (London: B. T. Batsford).—This well-known treatise in tabular form has been carefully revised, and the author has added new cases and decisions. The legal part of the book has been carefully revised by the late Mr. Edward Uttermare Bullen. Other chapters relate to the Conveyancing and Law of Property Act, 1881, and Amendment Act, 1892; the rights and liabilities of lessors and landlords, of lessees, tenants at will, tenants in tail, yearly tenants, &c. The construction and meaning of covenants to repair in their various forms are very fully discussed in tabulated form—a chapter of the book that every lessee should study before taking a lease of a house. Thus it is not generally known by ordinary persons that a landlord is not liable to repair premises where there is no express agreement to that effect, whether they be let to a yearly tenant or on lease. Even where the premises are in a dangerous state, the lessor is not liable. Neither is the landlord liable to rebuild, even though he has insured premises and received the amount from insurance office. (See "Leeds v. Cheetham," "Boyne v. Walker," &c.) The landlord is not bound to repair unless there is an express covenant to do so. We read also "A general covenant to repair is satisfied by the lessee keeping the premises in substantial repair." Table II. which deals with the rights and liabilities of lessees, concisely states all that the lessee is expected to do. He must pay the rent even if the premises are burnt down, unless there is an express covenant to the contrary. There is no implied covenant that if landlord omit to do the repairs according to covenant the lessee may do them and deduct the amount from the rent; the tenant is liable to rebuild the premises if blown down, and he must put them into repair where the lease of old premises contains covenant to keep in repair, and must leave them in repair at the end of term. Table XII: shows the rights and liabilities of yearly tenants. They are not liable for permissive waste, only for injury through voluntary negligence; they are not liable for dilapidations nor for accident or fire, and, as noticed by the author, the tenant is not generally liable in London to do any repairs. The dilapidations scheduled under the trades, the method of taking dilapidations, the interpretation of repairing covenants, duties of surveyors, powers of lessors, agricultural holdings, ecclesiastical dilapidations, a variety of other information, forms of notice of repair, schedules, and a very full list of cases cited, make this volume indispensable to the lessee, student and surveyor.—*A Manual of Practical Instruction in the Art of Brass Repoussé for Amateurs*, by GAWTHORP, art-metal worker to H.R.H. The Prince of Wales, second edition, revised (London: B. T. Batsford), is a useful shilling manual for students and amateurs in this interesting art. Repoussé work has lately become a favourite occupation among artistically disposed people of all ranks, to judge by amateur art exhibitions. T.R.H. the Princess of Wales and Princess Louise of Lorne are themselves amateurs, and the author acknowledges his gratitude for their encouragement and patronage. The manual is well illustrated with examples, and treats the subject in a practical manner, describing the tools, the selection of suitable metal, appliances, how to commence the various stages of outlining, grounding, raising, finishing, &c. Anyone following the directions given ought to be able to produce designs in copper, brass, or any suitable metal. The author has a thoroughly artistic perception of the art he illustrates.

## OBITUARY.

MR. EDMOND EGAN, A.R.I.B.A., died at his residence, Holmdale, Loughton, Essex, on Easter Sunday, aged 59 years. Mr. Egan had been an Associate of the Royal Institute of British Architects since 1880.

MR. ROBERT BAILLIE, the sole surviving partner of the firm of Westwood, Baillie, and Co., shipbuilders and engineers, of London Yard, Isle of Dogs, died at the residence of his son, Kent House, Lordship Park, N., on Saturday. He was born near Edinburgh in 1818, was apprenticed to a firm at Grove House, Edinburgh, and was employed on building the first steam cars made to run on the roads according to the late John Scott Russell's patent. He came to London in 1837, and ten years later he and his late partner, Mr. Joseph Westwood, became sub-contractors under the late Charles John Mare for the Britannia Tubular Bridge, North Wales, and on their return to London became Mr. Mare's works managers. In 1856 Mr. Baillie, with the late Mr. Joseph Westwood and Mr. James Campbell, commenced the business at London Yard, and many celebrated bridges were constructed by the firm, notably the Sukkar Bridge for India—which, previous to the completion of the Forth Bridge, was the largest cantilever bridge in the world—the Attock and Chenab Bridges, and hundreds of thousands of tons of bridge work for India, the Cape, and South America. The firm also built her Majesty's ships *Resistance*, *Valiant*, and other well-known vessels. Mr. Baillie married, in 1839, Emma, the daughter of the late Mr. Jonathan Bickford, of Milbrook, Cornwall, who survives him. Mr. Baillie, whose death occurred within five months of his diamond wedding, was a member of the Institution of Civil Engineers, the Institution of Mechanical Engineers and Society of Engineers, and an Associate of the Institution of Naval Architects.

## CHIPS.

A new club is being erected at Bolsover, and special consideration has been given to the ventilation, which will be carried out on the Boyie system.

At the vestry meeting for Wrexham parish, held on Monday, it was reported that a legacy of £500 had been left for the restoration of the windows of the noble parish church, conditionally upon another £500 being raised for the purpose within two years. It was stated that the tower and nave roof were in a bad condition, and that a thorough restoration would cost at least £10,000. It was unanimously resolved that the vicar and churchwardens be instructed to obtain a report from Messrs. Middleton and Prothero, or some other eminent architects, as to the work necessary to be done to thoroughly restore the fabric of the church and tower, and an estimate of the approximate cost.

Mr. W. N. Preece, C.B., late chief engineer to the Post-Office, was on Saturday officially appointed consulting engineer to the Department. This is a new office, which has been specially created in order to retain the benefit of Mr. Preece's experience in the arrangements required for carrying out the installation of the telephone system undertaken by the Government.

Sir Robert Reid, Q.C., M.P., turned on the water for the new clear-water tank at the Dumfries and Maxwelltown Waterworks at Lochfoot on Monday. The tank has been formed at a cost of between £3,000 and £4,000, and has a capacity of 250,000 gallons, its average depth being 12ft. The tank is lined with white enamelled bricks. It is surmounted by a superstructure of freestone, the interior being lined with red bricks, and a tiled footway running round the edge of the tank.

Two oil paintings have just been hung on the walls of the reception-room at the Foreign Office. They are full-length portraits of William IV. and Queen Adelaide in their full State robes, and were unearthed some time ago in an old curiosity shop in London by the Hon. Reginald Brett, the secretary to H.M. Office of Works, by whom they were purchased for the nation. They have been restored, and in their present position are a welcome addition to the interesting furnishings at the Home Office.

The Calverley Hotel at Tunbridge Wells was reopened for Easter after enlargement, refurnishing, internal decoration, and the provision of electric lighting. Mr. Jarvis, of that town, was the contractor for structural works, and Messrs. Haward for the electric lighting.

At St. Lawrence's Church, York, on Easter Sunday morning, the vicar dedicated two windows, completing a series on the south side. These lights complete a series of English northern saints, and give representations of St. Cuthbert, St. Hilda, St. Oswald, and St. Wilfrid.

## Building Intelligence.

ALLOA.—The Earl of Mar and Kellie formally opened on Good Friday the accident ward which has been gifted to the town of Alloa. The building has been erected from plans by Mr. R. A. Bryden, architect, Glasgow. The main building consists of a central administrative block and two wings—one containing wards for males and the other for females. Each of the wings contains one ward for six beds, one ward for three beds, and two private wards for one bed each. To the rear of the main building is the probationary ward, as also the washing-house, laundry, and drying-room.

BIRKENHEAD.—It is intended to proceed at once with the extension wing of the Borough Hospital, which was subscribed for in commemoration of the Diamond Jubilee of the Queen in 1897. The designs of the new building have been prepared by Mr. E. Kirby, of Liverpool, and the contract has been given to Mr. Richard Allen, of Birkenhead.

EDGBASTON.—A new high altar was unveiled at the Oratory Church, Edgbaston, on Wednesday. It has been erected from designs given by Mr. Danstan J. Powell, son of the late John Hardman Powell, who has also gratuitously superintended its erection. The style chosen is the Italian Renaissance, according with the architecture of the church, and the materials employed are alabaster, coloured marbles, mosaic, and gilt metal. The whole piece of work is 16ft. long and 10ft. high, and has been carried out by Mr. R. G. Lomas, of Derby, and the total cost is about £700.

PORTSMOUTH.—Preliminary operations in connection with the erection of naval barracks have been commenced this week. Anglesea Barracks have been acquired by the Admiralty from the War Department, and the main building—an extensive range, with clock-tower in the centre—will be utilised for the accommodation of seamen, the plans which have been prepared providing for extensive alterations and improvements. The officers' quarters and other buildings, including a long row of houses on contiguous land, formerly occupied by warders of the convict prison (which was closed some time ago, and absorbed for dockyard purposes), are to be pulled down. The contractor, Mr. H. Lovatt, of Wolverhampton, has undertaken to complete the barracks in about four years, at a cost of £400,000.

MONTROSE.—On Saturday afternoon the dedication of a reredos, erected in memory of the late Rev. John Woodward, LL.D., for thirty-two years Rector of St. Mary's Scottish Episcopal Church, was performed in that edifice by the Dean of Brechin. Dr. Woodward was an acknowledged authority on archaeology, and on historical and heraldic subjects. The reredos extends the full width of the triple lancet windows in the east gable, and is 15ft. wide by 12ft. high. The base to the height of the super-altar is built in courses of Caen stone enriched with carved paterae and floral ornaments. The super-altar is of Victoria red marble, and over it rises the central compartment of the reredos (the width of the altar), and divided into three carved and deeply-recessed pointed arches, supported by marble columns of green marble, with carved capitals over. The arches are deeply moulded and carved, and with crocketed gables over, the central one rising highest, and finished with a decorated cross. These three panels are divided and flanked by buttresses running up between the gables and surmounted by figures of angels. In front of the central panel and on the super-altar is placed the tabernacle, finished with crocketed gable and cross, and an oak door with brass mountings. On either side of the reredos the flanking spaces recede, and are treated in a less ornamental manner than the centre—the panels being arched, resting on carved capitals and columns, and finished with straight carved cornice over. The three central arches referred to are filled in with gold mosaics and opus sectile work, the subjects representing in the centre the Virgin and Child, surrounded by adoring angels, with the Shepherds and Magi in the side panels. The four side arches are fitted in with figures of the Four Evangelists standing out in relief on carved brackets. The material throughout is Caen stone, with marble shafts and mosaics referred to.

## ILLUSTRATIONS.

NEW BUILDINGS AT SOUTH KENSINGTON MUSEUM.—NEW GOVERNMENT OFFICES AT WESTMINSTER.—NEW STATION, CITY AND SOUTH LONDON RAILWAY, LOMBARD STREET, E.C.—“BUILDING NEWS” CLUB DESIGNS FOR A VILLAGE SCHOOL OF ARTS AND CRAFTS.—PUGIN TRAVELLING STUDENTSHIP PRIZE DRAWINGS OF HECKINGTON CHURCH, KETTERING CHURCH, AND WEEKLEY HOSPITAL, NEAR KETTERING.

## Our Illustrations.

ROYAL COLLEGE OF SCIENCE, SOUTH KENSINGTON.

THESE drawings, at present on view at the House of Commons, have an additional interest just now on account of Mr. Aston Webb's election the other day as an Associate of the Royal Academy, these drawings being the first published in illustration of any of his designs since this well-merited circumstance, to which we last week drew attention, was recorded. The block of buildings represented by the accompanying plan and sketch view, will occupy a long site extending the entire length of the Imperial Institute, which building it is to directly face, in front of the existing museum galleries. At the ends of Exhibition-road it is intended to erect archway screens, as shown, while in the midst of a central circus to be formed in this thoroughfare, between the main entrances of the new Royal College of Art and the Imperial Institute, a handsomely-treated tower-like structure, enriched with statuary, is to form a central feature. The general arrangement of the new College is indicated quite clearly by the ground plan printed on our double-page plate. The lecture theatres are located to the right and left of the entrance hall, and measure 60ft. by 50ft. each. The chemical laboratory is much larger, and rises, like the others, from a lower level than the ground floor. It is to be 38ft. by 84ft., being divided by a central range of piers. In a corresponding position on the plan the senior physics laboratory, L-shaped in form, will extend 60ft. both ways. These buildings are isolated from the main block, forming the façade of the college.

NEW GOVERNMENT OFFICES, WESTMINSTER.

THE accompanying elevation shows the vast improvement which will be realised in Parliament-street when the new Government buildings are built and connected (as we have previously described) with the Home Office by an archway arcade at the end of Charles-street. Spanning Downing-street another like archway will connect the Home Office with the Treasury buildings, as drawn on our plate, which consequently shows the whole scheme from Parliament-square up to the end of the Government buildings, a length of about 1,060ft. The Treasury, as here drawn, has the proposed central elevation added to increase the height and bring the façade more in unison with those of the other two blocks. It is doubtful, however, whether the stability of the fabric, owing to the many alterations which have already been done to the internal arrangements of this building, will allow of so much super-

structure being added. We agree that it would be wiser not to leave the intermediate part of the elevation as it is and lift up the end pavilions of the Treasury front, seeing that already it is intended to have towers added, by Mr. J. O. Scott, to the Home Office, while Mr. Brydon's block, as shown further down Parliament-street, is to be terminated in a similar fashion. This elevational drawing, embracing the whole of these buildings, illustrates at a glance their relative proportions in a very complete manner, and cannot fail to interest our readers. The plan and perspective view of the proposed new offices, of which Mr. J. M. Brydon is the architect, were published in the BUILDING NEWS last week.

## THE NEW WAR OFFICE.

WE give a general elevation of the Whitehall front of Mr. William Young's design for the new War Office, with the Banqueting Hall shown to scale, and the proposed Parliamentary library drawn as an exact replica of Inigo Jones's masterpiece on the north side of Whitehall-place. If built, as here suggested by Mr. Young, the new library would occupy the site of the present office of the Woods and Forests department. This scheme has a grandeur of idea, no doubt, and a repeat of the Banqueting Hall would, to a large extent, serve to redeem the irregularity peculiar to the War Office site as now determined upon. Mr. Young has spared no endeavour to master the difficulties presented by so awkward a site, and it must be also admitted that he has kept the proportions of his façade well in harmony with the handsome scale of Inigo Jones's façade. We have already in our leading article the week before last directed attention to the obviously different conditions as to the floor levels which govern the designing of the new offices and those with which the Court architect had to deal when he planned the state dining-hall of the new palace for King Charles. The plan of the new War Office and view now at the House of Commons were given in our pages last week.

## WEEKLEY HOSPITAL.

WEEKLEY Hospital is situated about two miles from Kettering. It was founded by Sir Edward Montagu in 1614, and is now used as an almshouse for men, 65 years being the qualifying age for admission. The illustration shows the centre gable. The panelled ornament round the sundial seems to have been added at a later date. The church of Weekley, which is interesting, contains a very fine example of a colour-decorated Elizabethan monument to the same family.

## HECKINGTON CHURCH, LINCOLNSHIRE.

THIS sketch shows the spire only, which is one of the finest in England, both in proportion and detail. The masonry of the tower is extremely good, the joints being very close. One is surprised, on examining the upper part of the spire with a field-glass, to find it just as well finished as on ground level. There is an Easter sepulchre in the church very similar in design to the famous one at Hawton, Newark, but very much inferior in workmanship.

## KETTERING CHURCH.

THE spire of this church is the only part which is of any interest. It is one of the best of its kind, and a great many churches with spires of similar design are to be found in the surrounding districts. The town itself contains little else of architectural interest.—HERVEY RUTHERFORD.

Mr. W. A. Ducaud held a Local Government Board inquiry at Scarborough on Wednesday into the application of the town council to borrow £6,698 for street improvements and footpaths, £3,245 for fire brigade purposes, £1,297 for works of sewage and storm-water drainage, and £920 for the purchase of land for public walks and pleasure grounds.

On Saturday afternoon the foundation-stone of a cottage hospital for the borough of Colne was laid by Mr. W. P. Hartley, of Aintree. Last year it was decided to build a cottage hospital in celebration of the Jubilee, and Mr. Hartley offered to erect a hospital which, with the site and furnishing, would cost £4,000, on condition that £4,000 more was subscribed by the public to form an endowment fund. This condition has been met.

## COMPETITIONS.

ARTISTIC POSTERS FOR SCARBOROUGH.—With the view of securing a suitable design for a poster to advertise the attractions of Scarborough as a watering-place and health resort, the advertising committee offered £60, divided into three prizes, and 91 poster designs were forwarded from various parts of the country, and will be exhibited at St. Nicholas House, until to-morrow night. The committee, who were assisted in the work of awarding the prizes by Mr. Aubyn Trevor Battye, editor of the *Artist*, has awarded the first prize of £30 to Mr. Alexander H. Webster, 134, St. Vincent-street, Glasgow, for a design which shows a view of the Spa and the North Bay treated in an extreme manner, and which was the nearest approach to a picturesque poster of any sent in, containing as it does a view of the Spa, Promenade, and a part of the Castle, a view of the North Pier, and small views of the Grand Hotel and the valley. The second prize of £20 has been awarded to Mr. H. Wanless, of Scarborough, for a picture representing a young lady in white, with red parasol, and a view of the Spa, Castle, and harbour; and the third prize of £10 goes to one whose *nom de plume* is “Laleham,” but who has omitted to send his name, it representing three children sitting on upright beams of timber, holding balloons in their hands, on which there is printed the word “Scarbro,” with a view of “Old Scarborough” in the distance. Seven other exhibits were highly commended.

## PROFESSIONAL AND TRADE SOCIETIES.

PEOPLE'S PALACE ARCHITECTURAL SOCIETY.—A society under this name has been formed in connection with the Building Construction and Building Trade Classes at the East London Technical College, People's Palace, E. The membership is open to present and past students. The society aims at promoting social intercourse between students of the Building Classes, and at mutual advancement by the reading and discussion of papers and visits to buildings and places of interest. The preliminary meeting was held on Feb. 25, and the following officers and committee were elected:—Vice-presidents, Mr. J. L. S. Hatton, M.A., Mr. D. A. Low, Mr. Francis R. Taylor, and Mr. Albert Grenville; committee, Messrs. Barclay, Beckett, Dann, High, Loates, Posenheim, Sumpter, and Worrow; hon. treasurer, Mr. F. Harper; hon. secretaries, Messrs. F. Ferry and C. Weaver. The first ordinary meeting was held on Saturday, March 25, at 7.30 p.m., Mr. Francis R. Taylor in the chair. A short paper was read by Mr. Watson on “Bricks.” The author, in a well-written paper, dealt with the manufacture and properties of bricks in a very interesting way. Mr. T. E. J. Kinch gave a short paper on “The Decay of Timber,” and this contained some very useful notes on the subject. The meeting expressed thanks to both the authors of the papers, and then adjourned. The first visit will take place to Messrs. Gibbs' Cement Works, at Grays, to-morrow (Saturday).

## CHIPS.

The 21st annual dinner of the Builders' Clerks' Benevolent Institution will be held at the King's Hall, Holborn Restaurant, on Tuesday next, Mr. Alfred Randall, the president, in the chair.

Mr. Martin Beatty, the principal surveyor to the Board of Agriculture, died on the 29th inst. from acute bronchitis, in his 66th year.

Sir William Henderson, Aberdeen, laid the foundation-stone of the new Free Church at Roches on Monday. The new church is being built from plans by Mr. Sutherland, Elgin. It is estimated to cost £2,200.

At the Dean of Guild Court held at Leith on Monday, the trustees of Newhaven Parish Church were granted warrant on amended plans to build an extension to the church which will provide for 220 additional seats, and to erect a session-house and vestry. The cost of the extension will be about £1,300.

The dedication of a new reredos and two stained-glass windows took place at Wolstanton parish church on Saturday. The reredos consists of three vitreous fresco panels, representing the Nativity on the left, the Crucifixion in the centre, and the Resurrection on the right, which have been painted and worked at Sir Henry Doulton's pottery, Lambeth. These panels are incased in a carved oak framework.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

J. S. H. (The series of articles entitled "Notes on Building Prices," by Mr. John Leaning, appeared in the issues of the BUILDING NEWS for May 30, June 13, July 11 and 25, August 8, 22, and 29, September 5, 19, and 28, October 10 and November 14 and 28, 1899; January 16 and 23, February 6 and 27, April 10 and 24, 1891; January 22 and Feb. 12, 1892; January 27, Feb. 3, 10, and 24, March 3, June 9 and 30, and October 27, 1893; November 30, Dec. 7 and 21, 1894; and January 4, February 8, April 12 and 26, 1895; extending with rather long intervals over Volumes LVIII., LIX., LX., LXII., LXIV., LXV., LXVII., and LXVIII. The series has not been republished.)

## "BUILDING NEWS" DESIGNING CLUB.

## SEVENTH LIST OF SUBJECTS.

G.—A Small School for a country parish, situate on a hill-side, and having a frontage towards the main road, which is level. The ground falls some 10ft. southwards from the frontage line, so that a covered playground is to be contrived under the main buildings, the ground-floor level of which is to be 1ft. above the footway. The building-line is to be fair with the frontage. The accommodation to provide a central hall 46ft. by 25ft., with four classrooms opening out of it, and adapted to be thrown into the hall on the occasion of general assembly and for public meetings. Cloak-rooms and conveniences for both sexes, and distinct entrances to be provided, also a bell-turret. Economy of contrivance and proper arrangement of classroom seating to receive careful attention, and be shown on the plan. The treatment of the building externally to be simple and picturesque, adapted for stone, with slab slates for the roof. Sufficient representations of the design to be furnished to illustrate the scheme properly, and a view sketch from the roadside to be given. Scale, 8ft. to the inch for elevations and section. Plans may be to the scale of 16ft. to the inch.

DRAWINGS RECEIVED.—"Honeysuckle," "Shamrock," "Grip," "Cloveley," "Desdichado," "McGilligan," "Arno," "Butts," "Rikki," "Vigornia," "Pup," "Marcus," "B. Gyn. R.," "Bits," "Vulcan," "Koh-in-noor," "Thistle."

## Correspondence.

## THE NEXT PRESIDENT OF THE INSTITUTE.

To the Editor of the BUILDING NEWS.

SIR,—There is a rumour afloat that the Council of the R.I.B.A. have nominated Mr. William Emerson, the present honorary secretary, for election as President for the ensuing year.

I venture to think that this nomination will be received with complete astonishment by the great body of members of the Institute, not because Mr. Emerson is not well able to occupy the Presidential chair, but because it is not yet his turn to do so.

I am quite aware that there is no obligation, so far as the written rules and regulations of the

Institute go, to elect as President one who has filled the office of Vice-President, and there may be instances quoted as precedents upon this particular point, but it is none the less certain that the expectations of the members are that, given a qualified and willing-to-serve Vice-President, he is the man who should pass on to the proud position of President as a matter of justice and of right—far stronger credentials than printed rules and regulations.

It is, I think, a fact open to little question, that of the four gentlemen who are now Vice-Presidents there is one who, from the work in the chair which he performed during the reign of the present President, from the fair and able manner in which he has ruled the debates under his chairmanship, from the position he holds as an architect in extensive practice, with all the knowledge and value to the Institute which such position entails, and from his consistent courtesy to all brought into contact with him, is fairly and fully entitled, and is unquestionably expected to fill, the Presidential chair for the ensuing year, and that gentleman, I need hardly add, is Mr. Henry L. Florence.

It has been said by some to whom I have spoken upon this subject, that it would be unfortunate if a contest were invoked on this election; but of the result of that contest, if it comes about, there cannot be a shadow of a doubt. Every member of the Institute is of one voice, and that voice is that the next president of the Institute should be Mr. Henry L. Florence.

I have not communicated in any way with Mr. Florence upon this subject, and I am, therefore, not aware whether or not he would submit himself for election if a substantial body of his professional brethren requested him to do so; but there is another course open, and one which I sincerely trust will be adopted by Mr. Emerson, and that is, that he should withdraw this year from the nomination as President, submit to be nominated as Vice-President, and come on in his due turn to fill the Presidential chair, which he would then do with the acclamation of the general body of the Institute, and succeed to an honour which, unless it is accompanied by the good wishes of his professional brethren as a body, becomes a mere empty bauble.

I should be glad to hear that Mr. Emerson will adopt the suggestion I have made—it will do credit to his sense of fairness; it may save a contested election, and it will enable the right man to take the right place at the right moment. In the mean time the views of the members of the R.I.B.A., either communicated to me direct or through the columns of this Journal, would be very useful as a guide to future action in the matter.—I am, &c., WM. WOODWARD.  
13, Southampton-street, Strand, April 5.

## SECRET COMMISSIONS.

SIR,—A communication appeared in your issue of the 18th ult. on the above subject over the signature of "An Architect." Surely this heading is a misnomer, and, instead of calling them "secret commissions," your correspondent should have headed his letter with "Trade Discounts," a title which places the matter in quite another category. It may be conceded at once that there is a need in some classes of products for a revision of the discounts. This is obviously the case where the discounts range from 40 to 60 per cent., as in some of the hardwood trades; but, allowing for this, your correspondent makes a great mistake when he thinks the discount upon goods is all profit. For instance, take paper-hangings and decorative materials. Most contractors in estimating for these take into consideration the discounts, about which there is nothing "secret," as an element in their profits, and it modifies their estimate for labour considerably; but does "Architect" think that if he were to eliminate this definite sum, that the work could be done for the same amount, minus the sum deducted as discount? If he does, he has little knowledge of human nature, and less of the modern conditions of the labour market.

Most contractors, however experienced, find that calculations as to the cost of labour on any given job have a knack of falsifying themselves almost automatically, and if they had to quote for materials "net," they would be bound to put on the margin which now exists in the shape of "discounts," or, what is tantamount to the same thing, an increased margin for their labour. My own experience is that the majority of contractors would only be too pleased to work on a system of

day work at a reasonable but assured rate of profit, like "Architect" does, for instance; but if they stand to be shot at by the vagaries of the modern labour market, they are entitled to an assured and an ample margin on their materials; especially as all responsibility for damage done to the materials in fixing attaches to the contractor—a consideration of no little moment.

The practice adopted by some architects, of seeking to intercept the profits—the legitimate profits—of the contractor, whether for their own pocket (a not unknown thing) or for their clients is equally reprehensible. If the architect or his client desire this, they should take the corresponding disadvantages and employ labour direct, and at their own risk. It appears to be very much in the nature of seeking to eat your cake and having it at the same time, a process admittedly difficult.

The duty of an architect is not exhausted by his client. He has a duty to the contractor—to the men who carry out his ideas and transmute them into things of beauty, and that architect gets the best value for his client out of his contractor who impartially and justly holds the balance between the two. There are architects whose names stink in the nostrils of all good contractors, and who constantly find it necessary to employ fresh men, because no good man will do a second job for them. They think that in tramping on and over-riding the rights of the contractor they are doing their clients service; but it is a left-handed kind of service after all, and is satisfactory to no one concerned.

"An Architect" might profitably turn his attention to the members of his own profession, some of whom have no hesitation in pocketing five and ten per cent from contractors in addition to their professional charges to their clients. If "Architect" thinks he is going to deprive his contractors of what is a legitimate trade profit and still get his work done at the same rate, he is labouring under a delusion, which he had better wake from as soon as possible.—I am, &c.,

CONTRACTOR.

## Intercommunication.

## QUESTIONS.

[12223].—Joists and Girders.—Will some reader of the BUILDING NEWS kindly give the best modern formula for calculating the breaking weight of steel joists and girders, and oblige?—G. F. LAKE.

## REPLIES.

[12216].—Thickness of Walls of Churches.—It would be best to write to the secretary of the Incorporated Church Building Society, 7, Dean's-yard, S.W., for a copy of their "Instructions to Architects." Their rules are many, and are stringently applied; and they have, besides, preferences, which it is well to know—for square chancel ends, for example.—G. A. T. M.

[12217].—Sashes and Frames.—Take the superficial dimensions out to out, allowing an inch in the height. This allowance is to cover meeting rails. The price you name is a fair one. From top of sill to soffit of arch it is usual to add 3in. for the height and 9in. to the width between the reveals.—G. H.

[12218].—Architect's Powers.—It must be a very loosely drawn contract not to give the architect the right to refuse inferior material, whether before or after insertion in the work, and he is undoubtedly the judge to be consulted as to quality. In any case he would be fully justified in withholding certificates until poor material were replaced by such as satisfied him.—G. A. T. MIDDLETON.

[12215].—Architect's Powers.—The architect has power to order removal of inferior bricks and timber under most contracts, and the contractor is liable. "Thomas" had better get an experienced surveyor or architect to read the contract, and give his opinion before he refuses to do the work.—PRACTICAL.

[12220].—Cottages.—Get "English Country Cottages," by Green. The sums you give are low, but cottages have been built in the Home Counties at the figures quoted, and are let at from £2 10s. to £3 10s. per annum. Those on estates like the Duke of Grafton's and Lord Cadogan's are well built, and have good gardens, sheds, and outhouses. Cottages of this cost can be built of brick with tile roofs with ordinary-sized rooms. The floors are of stone or brick on concrete. A living-room, about 15ft. square and 8ft. 6in. high; a back kitchen, with fireplace, copper, and sink, a pantry, fuel-store, three bedrooms, about 10ft. to 15ft. square, with distinct access to each.—A COUNTRY BUILDER.

[12222].—Ferro-Prussiate and B.W. Photographic Processes.—Copies are made by these processes from tracings made in black ink (no colour or washes) on thin tracing paper. Descriptive pamphlets and all necessary particulars are to be had from most photographic dealers, such as Hinton and Co., Bedford-street, Strand; Fallowfield's, Charing Cross-road; or Stanley, Great Turnstile.—G. A. T. MIDDLETON.

A new park 1½ acres in extent was formally opened at Sally Oak, Birmingham, on Monday.

## LEGAL INTELLIGENCE.

**PORTICOES AND THE LONDON BUILDING ACT**—At the Marlborough-street Police-court on the 29th ult., the Coburg Hotel, Limited, appeared to an adjourned summons taken out on behalf of the London County Council under section 200, subsection 3, of the London Building Act, 1894, as amended by the Amendment Act of 1898. Mr. Chilvers, from the solicitors' department, represented the Council, and Mr. Ernest Pollock, barrister, appeared for the defendants. Mr. Chilvers stated the summons was in respect of an iron and glass portico erected in front of the entrance porch of the Coburg Hotel, Carlos-place, St. George's, Hanover-square. The Council had given their consent to the erection of the porch, but declined to sanction the erection of the portico. However, notwithstanding the Council's refusal to give their consent, the defendants, in December last, erected the portico, and he now asked the magistrate for an order for its demolition. Evidence was given as to the portico extending over the public way and projecting 4ft. 3in. beyond the general line of buildings as defined by the architect to the Council. Mr. Pollock, for the defence, contended that the portico was not a structure within the meaning of section 22 of the London Building Act, and in support of his contention he referred to section 73 of the Act, and he further contended that the proviso in section 22 applied to this case, as the land on which the hotel was erected has been previously lawfully occupied by a building. Mr. De Rutzen, the magistrate, having taken time to consider his decision, stated he was clearly of opinion that the portico in question, which, according to the evidence, was wholly in advance of the general line of buildings, and was 11ft. in length, was a structure within the meaning of section 22 of the London Building Act, 1894, and did not come within the exemption contained in the proviso to that section as contended by the defendant's counsel. He therefore made an order for its demolition within one month, and also imposed a penalty of £2 with 5s. costs. On the application of Mr. Pollock, the magistrate stated, however, he would be quite willing to state a special case for the High Court.

## CHIPS.

The general committee for the repair and restoration of Chichester Cathedral have appointed Sir Arthur Blomfield, A.R.A., to succeed the late Mr. Pearson, R.A., as their architect, and this selection has been approved by the Dean and Chapter. The newly-appointed architect has been requested to report on the work that he thinks necessary; and a meeting will be held in Brighton early in June, when the needs of the building will be brought before the diocese.

In the case of John William Carr, of Green-street, Upton Park, builder, the order of discharge from bankruptcy has been suspended for three years, ending March 1, 1902.

The urban district council of Frome have decided to invite competitive designs from architects for a school of art, to be afterwards extended to serve as a technical school. Premiums will be offered.

New gasworks offices in Broad-street, Hanley, were opened last week. The premises were till recently known as Barrack House, and have been altered from plans by Mr. J. R. Heath, engineer to the Gas Company, the builder being Mr. T. Godwin, of Hanley.

Messrs. Singer, of Frome, have just founded a cast in bronze of the model of Cromwell, made by Mr. Hamo Thornycroft, R.A., for an unknown admirer of the Protector (some say Lord Rosebery). It is understood that the statue will be presented for erection in the Metropolis, though where it is not known.

Visitors to Douglas this season will miss a favourite landmark. The last vestige of old St. Matthew's Church, which stood in the market-place near the quay, has just been removed. Built in the early part of the 18th century by Bishop Wilson, it was the most interesting relic of his episcopate. Hugh Stowell Brown, in his day one of the most popular of Liverpool's preachers, was born in the chaplain's house hard by. His father was the chaplain.

New public baths are being erected in the High-street, Wandsworth, adjoining the bridge over the river Wandle, from plans by Messrs. Spalding and Cross. The cost will be about £20,000. The style is English Renaissance, and the front will be built of red bricks, with Portland stone dressings. The building will have a frontage of 75ft., and an average depth of 246ft. The plans provide for a first-class swimming-bath 100ft. by 30ft., and a second-class bath 85ft. by 30ft.; six men's first-class slipper-baths, and thirty second-class; the ladies will be provided with four first and eight second class. The suite of private baths will have waiting-rooms and offices attached. An establishment laundry will be worked by an electric motor.

## Our Office Table.

THE annual dinner of the Society of Architects will be held on Wednesday, the 26th inst., at St. James's Hall, Piccadilly, and promises to be influentially attended. Among those who have signified their intention of being present are the Lord Chancellor (Earl Halsbury), Sir David Evans, Sir James D. Linton, the Right Hon. Edward Carson, Q.C., M.P., Mr. J. A. Rentoul, Q.C., M.P., Mr. Atherley-Jones, Q.C., M.P., Mr. Ernest Flower, M.P., Mr. Robert Vigers (the President of the Surveyors' Institution), Mr. Andrew Murray (the City architect), Mr. Charles Welsh (the City librarian), Mr. T. L. Corbett (Deputy-Chairman London County Council), Mr. Joseph Randall (the President of the Institute of Builders), and the Masters of the Worshipful Companies of Plumbers, Carpenters, and Tilers and Bricklayers (Alderman Richard Hind, and Messrs. J. Claxson Preston and H. Mansfield).

A LARGE, representative, and comprehensive collection of Turner's work in oil and water colours will be on view at the art loan exhibition in the Guildhall Gallery, to be opened by the Lord Mayor in state on Monday next. The Turner collection will be supplemented by examples of his contemporaries, including Sir Joshua Reynolds, Gainsborough, Constable, Sir David Wilkie, R. Wilson, W. Collins, Stanford, and Nassmyth. The large gallery will be devoted to Turner's oil-paintings, and the gallery at the west end will be occupied by a selection of plates from his "Liber Studiorum," the principal contributors of these latter examples being the Rev. Stopford and Mr. W. G. Rawlinson. In the smaller gallery a collection of about seventy water-colours by Turner will be on view. A characteristic collection of the works of the great artist's contemporaries will be found in the large upper gallery. The general public will be admitted on Tuesday in next week. The exhibition will remain open until Monday, July 10.

THE country meeting of the Surveyors' Institution, for the present year, will be held, by kind permission of the mayor and corporation, in the reception-room of the Council House, Bristol, on Wednesday, the 26th inst., at 11 a.m., when the following papers will be read and discussed:—"Bristol," by Mr. William Sturge (past president); "The Railways and the Farmers," by Mr. W. M. Acworth, barrister-at-law; "The Proposed Provision of Workmen's Houses by Loans from Local Authorities," by Mr. Howard Martin (fellow). The members will dine together at the Grand Hotel, Broad-street, Bristol, in the evening. The following day will be devoted to excursions to places of interest in Bristol and its vicinity, Tintern Abbey and Chepstow Castle, and Wells and Glastonbury. The next ordinary general meeting in London will be held on Monday, May 1st, when a discussion will take place on the "Agricultural Holdings Bill," prepared and brought in by Mr. Channing and others. The annual dinner of the institution will be held at the King's Hall, Holborn Restaurant, on Wednesday, May 10th.

LORD RONALD GOWER, in a letter to the *Times*, suggests that the Hyde Abbey, Winchester, would be the most appropriate place in which to erect a memorial to King Alfred. Turning out of Jewry-street in that city, a narrow lane called after Alfred leads, he says, to a handsome 15th-century ecclesiastical gateway, attached to an old barn-like building. Beyond the gateway a farmyard is entered, with a number of barns and outhouses; this is all that remains of the abbey founded by the great King, and the place where his body, that of his Queen, and of his son, Edward the Elder, rested for seven centuries, till at the close of last century the stone graves were used to mend the roads and the ashes which they contained thrown away. It would be possible to remove the farm buildings and clear away the surrounding rubbish, thus removing a standing scandal to the city of Winchester. He suggests that on the site might be erected a half-circle of pillars, or a cloister, within which might be placed a colossal cross inscribed to Alfred.

"THE ART OF WILLIAM MORRIS," published as an "Easter Art Annual" of the *Art Journal*, is a cheap and interesting collection of illustrations of some of Morris's designs. The coloured illustrations are crude, the rest are very well produced. The letterpress is by Mr. Lewis F.

Day, and is fair and appreciative—more so, perhaps, than might reasonably have been expected of one who evidently understood Morris so little as to write as he does on page 10, that Morris "never seemed to suspect that socialism (as understood by his political brethren) would leave less room than ever for the free action of a man—of a man, that is to say, as distinguished from a sheep"! If socialism is powerless to bring back that "free action," so much the worse for all of us. Morris's own life was certainly no proof of any such inability.

LORD KELVIN has just prepared a report on some investigations made by Professor Archibald Barr and himself in Edinburgh, Bradford, and Oldham, on the subject of the destruction of town refuse. In one instance Lord Kelvin experimented on damp ashpit refuse, containing a large proportion of night soil and vegetable matter from markets and shops. This was consumed without the slightest trace of smoke. In addition to this solution of the smoke difficulty the residual products proved to be of great commercial value. In another case the steam produced by the process of destruction was utilised for the driving of electric-lighting machinery and other power purposes. No coal or coke whatever was employed, and in this instance also there was an entire absence of smoke. Lord Kelvin considers that our public bodies have no longer any excuse for referring to "waste products," but have within their reach the means of turning the most unpromising refuse to account.

A PROCESS for seasoning wood by electricity is now being introduced into this country. The method is known as the Nodon-Bretonneau process, which consists in placing the timber to be seasoned in a tank, and immersing it all but an inch or two, in a solution containing 10 per cent. of borax, 5 of resin, and 0.75 of carbonate of soda. The lead plate upon which it rests is connected to the positive pole of a dynamo, and the negative pole, being attached to a similar plate on its upper surface so as to give good electrical contact, the circuit is completed through the wood. Under the influence of the current, the sap appears to rise to the surface of the bath, while the aseptic borax and resin take its place in the pores of the wood. It requires from five to eight hours, according to the character of the wood, to complete this part of the process, the timber afterwards being removed and dried in either by artificial or natural means. In the latter case exposure to summer weather for a fortnight is said to be equivalent to storage in the usual way for five years.

A REPORT on electric traction for tramways has been submitted to the Corporation of Southampton by a deputation who visited Dover, London, Glasgow, Liverpool, and Bradford. The deputation, after inspecting the systems in these towns, were unanimously of opinion that the overhead system adopted by the Southampton Corporation is the cheapest and best, and that the electric system throughout the various towns has proved to be economical and advantageous. The electrical engineer also submitted a report, which the deputation summarised, and made the following recommendations:—1. That double lines be used wherever possible. 2. That side poles and centre poles be used in all positions favourable, but span wires are not recommended. 3. That fixed stopping-places be adopted throughout the entire system, and that such stopping-places be denoted on the lamp columns, at a distance of about 220 yards apart. 4. That the Corporation adopt a type of car similar to car No. 450 in use by the Liverpool Corporation, and that Messrs. Kincaid, Waller, and Manville be instructed to prepare a specification with such modifications, including longitudinal seats, as may be necessary, and to obtain tenders to be submitted to the Corporation. 5. That in view of the recommendation to immediately order the rolling stock, Messrs. Kincaid, Waller, and Manville be instructed to prepare plans and specifications for the necessary alterations to the Shirley depot. 6. That time recorders be placed at each terminus, as at Dover. The report and recommendations have been adopted by the Corporation.

At the last meeting of the Lincoln Corporation it was decided to make application to the Local Government Board for loans amounting to upwards of £10,000 for additions and alterations to the market, and for building a model abattoir. Plans are also in hand for a City Isolation Hospital, the site of which has already been secured. These are among many signs of the interest in

sanitary science which is spreading in the eastern counties. Many of the leading sanitary engineering firms have already responded to the invitation of the local committee to exhibit at the Health Exhibition to be held in the Drill Hall, Lincoln, from the 3rd to 19th August. This exhibition, the first of its kind ever held in the county of Lincoln is being arranged in conjunction with the annual provincial meeting of the Sanitary Inspectors' Association.

A NOVEL agitation was inaugurated in Aberdeen one evening last week, when a public meeting was held under the auspices of the Operative Masons' Union to protest against jerry building. It was stated that the architects and master masons of the city had been invited to attend, but had declined, holding that a private conference as to procedure should first be held. Resolutions were unanimously adopted to the effect that in view of recent experiences in the building trade the meeting protest against the operations of the jerry builder on the ground that they were dangerous to workmen and detrimental to the community, in so far as dwellings were erected not with the view of the comfort and convenience of occupants, but solely in the interests of the speculator, and urging the town council to have fully-qualified inspectors or architects to supervise all work to which the plans committee gave sanction. The meeting has given rise to an animated correspondence in the local newspapers.

THE Fitzwilliam Museum Syndicate, in their 50th annual report for the year 1898, announce the gift of two pictures from Mr. T. Bumpstead, of Trumpington. One is a painting, on panel, of the school of Holbein, dated 1549, representing a man and his wife; the other is a portrait of an old man, by the sculptor Bernini. Professor W. M. Flinders Petrie has presented a number of specimens of pottery, mace-heads, and smaller objects, found during his excavations on behalf of the Egyptian Research Account in 1898. An engraving of the interior of the Leyden University Library by Woudanus and a collection of 48 engraved portraits of Cambridge celebrities have been presented by J. Willis Clark, M.A., Registrar. The principal purchases have been: A MS. of Aristotle's "Analytics" of the 14th century, written in Italy, with illuminated initials. A copy of the German version of Sir John Mandeville's Travels, printed at Basel, *cir.* 1480, with numerous hand-coloured woodcuts. A series of photographic reproductions of pictures in the Prado Gallery at Madrid, and of pictures by Rembrandt in the galleries of Berlin, Cassel, and Dresden. A set of E. aus'm Weerth's publications of Monuments of Early Rhenish art. Two water-colour drawings by T. M. Rooke—viz., a view of Troy (Aube) and one of Beaugency (Loir-et-Cher). A volume of miscellaneous engravings by (and after) Martin van Heemskerck, the elder Brueghel, and other artists of the 16th and early 17th centuries.

In the case of John Edward Tate, of Huddersfield, architect and surveyor, a discharge from bankruptcy has been conditionally granted.

A lecture on the Upper Stour Valley Sewerage Scheme—its arrangement, service, and cost—was given in the Trinity Hall, Old Hill, on Wednesday week, by Mr. W. Fiddian, one of the engineers to the Upper Stour Valley Main Sewerage Board. Mr. Fiddian pointed out that the cost of carrying out the scheme was £124,976, and the area of the district drained 17½ square miles, the length of sewers, carriers, and house connections 250 miles, and the sewers delivered daily 1½ million gallons.

The existing lunatic asylum, jointly owned by the counties of Leicester and Rutland, being inadequate for modern requirements, the joint committees of the two county councils have agreed to purchase an estate in the parishes of Narborough and Enderby, for the erection thereon of a new asylum. It is proposed that the asylum shall be planned for 800 patients, but that for the present the proposed new asylum shall provide for the accommodation of 650 pauper patients only, with administrative departments adapted to the larger number, leaving two blocks for the remaining 150 to be hereafter erected.

Owing to the Easter festival there was a great falling off in the number of sales held in the Tokenhouse-yard Mart during last week, and the returns show a decided drop. The properties disposed of consisted chiefly of metropolitan and suburban investments, which together produced a total of £29,761. The residential and training estate, Moulton Paddocks, Newmarket, the property of the late Mr. Alexander Baird, comprising a mansion and 757 acres, was sold for over £40,000.

#### MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—St. Paul's Ecclesiological Society. Visit to the Dutch Church, Austin Friars, E.C. 3 p.m. —EDINBURGH ARCHITECTURAL ASSOCIATION. Visit to Woodhouselee Mansion. Meet at Rutland-street. 2 p.m.

MONDAY.—Royal Institute of British Architects. Paper on the "Application of Colour to Interior Ornament in Relief." 8 p.m. —BRISTOL SOCIETY OF ARCHITECTS. "Iron and Bronze Work," by Herbert Singer, of Frome. 8 p.m.

TUESDAY.—Builders' Clerks' Benevolent Institution. Annual Dinner, King's Hall, Holborn. 6 for 6.30 p.m. Institution of Civil Engineers. Discussion on "Alloys of Iron and Nickel"; and paper entitled "Buenos Aires Harbour Works," by James Murray Dobson, M. Inst. C.E. 8 p.m.

WEDNESDAY.—Society of Arts. "Telephones," by John Gavey, Assistant Engineer-in-Chief and Electrician to the General Post Office. 8 p.m.

FRIDAY.—Architectural Association. "Modelling as Applied to Architecture," by F. W. Pomeroy. 7.30 p.m. The Glasgow Architectural Craftsmen's Society. Reading of Prize Essay.

SATURDAY.—Architectural Association. Visit to Fishmongers' Hall, London Bridge. 3 p.m.

#### THE ARCHITECTURAL ASSOCIATION.

APRIL 14th.—ORDINARY MEETING, No. 9, Conduit-street, W. 7.30 p.m. Mr. F. W. POMEROY on "MODELLING AS APPLIED TO ARCHITECTURE," with Practical Demonstrations.

APRIL 15th.—SPRING VISIT TO FISHMONGERS' HALL, London Bridge, 3 p.m.

E. HOWLEY SIM } Hon. Secs.  
G. B. CARVILL }

#### CHIPS.

The corporation of Ipswich, at a special meeting, have decided to widen College-street, a narrow thoroughfare leading from Stoke Bridge to the Docks, from 20ft. to from 35ft. to 26ft., at a cost of £1,000, and also agreed to several minor street improvements.

The Ostermouth urban district council have raised the salary of their surveyor, Mr. J. S. Bran, formerly town surveyor of Christchurch, Hants, by £50 a year.

The new parish church of St. Aidan, Bradford, Manchester, will be consecrated by the Bishop of Manchester on Sunday. The edifice is constructed of local bricks, with dressings inside and outside of terracotta, and consists of nave and chapel in one span, organ chamber, clergy and choir vestries. The architect is Mr. R. Bassett Preston, of Diocesan Chambers, Manchester. The cost, including site and furniture, has been £6,600, and 528 sittings are provided. Mr. R. Carlyle, of Ardwick, was the builder.

The name appears among Friday's list of adjudications in bankruptcy of Thomas Clarke, of Chancery-lane, W.C., and the Constitutional Club, Northumberland-avenue, W.C., late The Gables, Upper Hamilton-terrace, St. John's Wood, N.W., surveyor.

Mr. A. B. Hicks held an inquest at Lambeth on the 30th ult. on James Young, aged 36 years, a foreman scaffolder in the employment of Mr. Sarff, builder, of West Kensington, and lately residing at 9, Caslon-street, Lambeth. On the previous Friday the deceased, while at work on some buildings in course of erection in the South Lambeth-road, stepped on a putlock which was loose, the uprights having only shortly before been removed, and fell to the ground, a distance of 21ft. He was conveyed to St. Thomas's Hospital, where he died two days later from a fracture of the spine. The jury returned a verdict of "Accidental death."

Mr. H. H. Ward, one of the Local Government Board Inspectors, attended at the Guildhall, Canterbury, on Tuesday week, to hold an inquiry into the application of the town council to borrow a further sum of £13,250 for the purposes of the electric light and dust destructor works.

A large new lodge will shortly be erected at the south entrance to Beaulands Park, Cumberland, for Mr. R. G. Graham, J.P., from plans prepared by Mr. T. Taylor Scott, F.R.I.B.A., architect, Carlisle. It will be in the form of a cross with four gables, and constructed with coursed red stone walling of an ornamental character and green slated roofs.

Messrs. W. G. Sutherland, Ltd., the well-known stained-glass artists, of Manchester, have removed their premises from Mosley-street and St. Peter's Works to self-contained premises at Longford Studios, 16, Oxford-street, Manchester. This step has been rendered necessary in order to get the whole of the staff and artists under one roof. At the new premises the whole of the operations will be conducted under the personal supervision of Mr. W. G. Sutherland. All communications should be forwarded to the above address in future.

London, W.C.—Builders' Materials and Timber to Asylums and Hospitals	Metropolitan Asylums Board	T. Duncombe Mann, Norfolk House, Norfolk-street, Strand, W.C.	27

## Trade News.

## WAGES MOVEMENTS.

**PLASTERERS' LOCK-OUT.**—A conference between the National Association of Master Builders and the National Association of Operative Plasterers took place at the offices of the former, in Bedford-street, Strand, yesterday (Thursday), but the result was not known when we went to press. Each side had appointed 12 representatives, and the points discussed were those set forth in the employers' ultimatum to the union on Feb. 1—viz.: The limitation of apprentices, the practice of "black-listing" certain building firms, the refusal to work with non-unionists, and the refusal of the union to accept the decision of employers as to which workmen shall do certain work. The employers were represented by Messrs. W. Houldsworth (Huddersfield), R. Neill (Manchester), T. F. Rider (London), B. I. Greenwood (London), J. Bowen (Birmingham), W. Symonds (Cardiff), J. Lowry (Newcastle-on-Tyne), W. Nicholson (Leeds), J. Higson (Manchester), W. Blake (Plymouth), John Rule (Sunderland), and G. Nichols (Leicester). The representatives of the Plasterers' Union were its president (Mr. Mark Jones), the general secretary (Mr. M. Deller), and delegates from Cardiff, Birmingham, Bristol, London, Leeds, Liverpool, Manchester, Newcastle-on-Tyne, and Nottingham.

**ASTON-UNDER-LYNE.**—The question of an increase in the wages of operative painters has been settled without resort to a strike. Colonel John Eaton, architect, as arbitrator between the masters and the operatives, has decided in favour of the men's claim for an increase of  $\frac{1}{2}$ d. per hour from July 1. In regard to other points, the arbitrator has fixed the hours from six in the morning to 5.30 at night from the 15th of March to the 15th of October, to come into force from April 1 this year. His decision as to the apprentice rule is also in favour of the men.

**ECCLES.**—An advance of  $\frac{1}{2}$ d. per hour has been granted to the operative painters in the Eccles, Patricroft, Pendlebury, and Swinton districts, to commence this week, increasing the rate to  $8\frac{1}{2}$ d. per hour. A concession of half an hour in the time of starting work has also been made. The painters' application was for 1d. per hour advance, and time and a quarter for the first two hours' overtime.

**GRIMSBY.**—The joiners struck on Saturday for  $\frac{1}{2}$ d. per hour advance.

**LEICESTER.**—The demand of the Leicester bricklayers' labourers for an advance of 1d. per hour not having been acceded to by the Master Builders' Federation, the local members of the union refused to resume work on Wednesday. The men number about 700. By their action the bricklayers are also stopped, so that some 2,000 men are affected. The rate of pay at present for labourers in Leicester is 6d. per hour.

**NEATH, SOUTH WALES.**—The stonemasons and bricklayers of the Neath district struck work on Saturday, the employers having failed to comply with the demand for an increase of wages.

**OLDHAM.**—The painters, numbering fully 200,

came out on strike on Saturday for an advance of  $\frac{1}{2}$ d. an hour, from 8d. to  $8\frac{1}{2}$ d., which the employers have unanimously decided to resist. A lengthened stoppage is not unlikely, as both sides are evidently determined upon their position. Work will be almost totally suspended, as the non-unionist painters in the town are exceedingly few. Similar disputes are pending in other Lancashire towns.

**RADCLIFFE.**—Notice was given to the masters in September last by the painters in the Radcliffe, Whitefield, and Prestwich District of the Amalgamated Society of House-Painters and Decorators for an advance from 8d. to 9d. per hour, which was requested to come into operation on April 1. The final meeting of masters and men was held on Monday at the Boar's Head Hotel, Radcliffe, when an agreement was come to, the men accepting  $8\frac{1}{2}$ d. per hour, and agreeing to work under Manchester rules in place of the Radcliffe District rules, which have been in force for several years.

**SCARBOROUGH.**—The secretary of the Labourers' Union recently wrote to Mr. Moore, a builder at Scarborough, notifying that unless a non-union labourer in his employ was discharged the union men would strike. The letter was referred to the Master Builders' Association, who informed the union that if Mr. Moore's men struck all the union labourers in Scarborough would be locked out. The men struck work on Wednesday, and the lock-out was enforced yesterday.

**SUNDERLAND.**—The notice recently given by the builders' labourers to the masters for an advance of wages has been discussed by the committee of the Northern District Federation, and they have decided that, as the labourers' wages are the highest paid in any provincial town in the kingdom, the notice is unreasonable, and the demand will be resisted.

At the first election of urban district councillors for Ilminster, on March 27, Mr. Alexander Poole, builder and contractor, was returned at the head of the poll. There were 21 candidates for 12 seats.

The Allenton Schools, Derby, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Mr. Lorenzo B. Wheeler, an architect well known in the Southern States of America, died last week at his home in Danbury, Conn. Mr. Wheeler began practice in New York, for a part of the time in partnership with Mr. Hugh Lamb, but removed eight or nine years ago to St. Louis, where he remained until failing health compelled him to give up practice altogether, and return to Connecticut. Among his works in Atlanta are the Kimball House and the Constitution building; and he built at Memphis the Cassitt Library, and a public library at East St. Louis, besides several court-houses in the south.

A stained-glass window, erected in memory of the late Dean Lake, was unveiled in Durham Cathedral last week. The window has been placed in the eastern wall of St. Gregory's Chapel, in the north transept. The chief subject is Our Lord seated in Glory, and below are figures of SS. Benedict, Oswald, Cuthbert, Francis, and Aidan.

## CHIPS.

The new Headland Hotel at Newquay is in course of completion, the roof being now on. It is being built at a cost of £21,000 by Mr. Arthur Carkeek, of Redruth, and the contract for the supply of terracotta has been taken by the Ruabon Coal and Coke Co., for a further sum of £4,054. Mr. Silvanus Trevel, of Truro, is the architect.

Additions are being made to the brewery of Messrs. Bushell, Watkins, and Co. at Westerham. The new premises cover a superficial area of 6,000 sq. ft., and consist of offices and board-room on ground floor, with clearing-room on first-floor, and malt and hop stores above, while the basement will store 2,000 barrels. The walls are of red brick, and the outlay has been £5,000. Mr. Harrison Fagg, of Tonbridge, is the architect, and Mr. Walter Wallis, of Balham, S.W., is the builder.

The will of Mr. Josiah Latimer Clark, F.R.S., M.I.C.I., M.I.E.E., of 31, The Grove, Bolton, and 11, Victoria-street, Westminster, has been proved, the value of the estate being £10,149 15s. The testator bequeaths his machinery, plant, tools, and all his interest in the business of a dock engineer carried on at Grays, Essex, and also his books, plans, letters patent, &c., to his son Lyonel Edwin.

Mr. Vincent Stuckey Lean has bequeathed £50,000 for the improvement and extension of the library and reading-room at the British Museum, and large sums to various charities, colleges, and hospitals.

The Mayor of Blackburn has formally opened the new electric tramways in the borough. The corporation has purchased the whole of the tramways working in Blackburn, but so far only four miles have been electrically equipped.

At a special meeting of the Royal Society of Painter Etchers and Engravers, held on March 9, M. Bolingbroke, R. Bryden, and W. Monk were elected ordinary Fellows.

The authorities of St. Bartholomew's Hospital have decided to carry out in one of the wings of the institution a series of alterations similar to those already completed in another wing. The present deal flooring will be taken up and replaced by teak. The wards will also be warmed by hot water pipes and stoves. These will involve the closing of about 160 beds from the commencement of May until October next, by which time the alterations are to be completed.

Mr. J. Dewhirst, surveyor and sanitary inspector of Guildford, has been appointed to a similar position at Chelmsford.

A free open-air bath, situate adjacent to the Water Committee's pumping station, Green-lane, Liverpool, was publicly opened last week. It is 73ft. long, 45ft. wide, and contains 70,000 gallons of water, the temperature of which can be regulated from 80° Fah. downward as required. There will be a constant flow of clean warm water through the bath at the rate of 5,000 gallons per hour. A small cleansing bath is provided, where children may be cleansed before entering the swimming-bath. The usual dressing-shed and other accommodation is provided. The whole of the work has cost about £1,000.

## "SANITAS" DISTEMPER.

A Washable Sanitary Distemper for Whitening and Disinfecting Walls and Ceilings of Passages, Cellars, Stables, Kennels, Sheds, Farm Buildings, Railway Trucks, Horse Boxes, and for General Use.

### APPRENTICESHIP TO THE BUILDING TRADES.

FROM the evidence elicited by the Special Committee of the Technical Education Board on the question of apprenticeship, it appears that employers do not often readily co-operate to assist in the training of youths for the building trades. So long as the London employer can obtain from the provinces ready-trained artisans for his work, he does not trouble, nor find it remunerative, to take raw youths into his workshops. The payment of large premiums—even sums of £25 or £40—is beyond the means of workmen to give with their sons, and the evidence given on this head by Mr. Henry Holloway and others is instructive. The decline, he said, as to taking apprentices on behalf of the masters was their belief that apprentices did not pay, and the youths often caused trouble and inconvenience. The consequence of the decline was the lowering of the "standard of skilled mechanics, and a difficulty of securing good foremen." There are a few exceptions. Messrs. Holloway take apprentices in all the trades except painters, and these turn out to be the best workmen. Applicants in most of the trades are plentiful, and the premiums charged vary from £5 to £20 or £25. Sometimes the applicants are able to obtain assistance from charitable funds. The firm hold a check on unruly apprentices by having a clause in the indentures "to the effect that if the apprentice gives satisfaction and makes good progress, at the end of the term the sum of £5 will be paid to him as a gift." The wages given are from 5s. to 6s. a week, rising to 18s. or 20s., and the term of apprenticeship is from five to six years. A clause also states that the apprentice is required to attend technical classes under the Science and Art Department; but this expert admitted that these classes could not supersede apprenticeship, and they had no practical bearing upon the ordinary work of the shop. Practical instruction can only be obtained in the workshop.

It is important the apprentice should learn the whole trade, not a part of it; the class looked only at one branch. Referring to the action of the Technical Education Board in granting funds, it was suggested that all charities and trustees of funds for assisting apprentices should require as a condition that the apprentice should attend evening classes. These funds from the guilds, &c., could be administered by a central authority who would act between the employer and apprentice. On the whole, Mr. Holloway's evidence is in favour of apprenticeship, as the only means of acquiring a thorough and practical knowledge of the trades as a whole, and his experience shows that the apprentice turns out the best mechanic, although he does not pay for some time. Very similar evidence was adduced by Mr. Howard Colls, of the well-known firm. While acknowledging the excellent training of polytechnics, he said they could not turn out men as skilled tradesmen. The work the young apprentice wanted engaged all day was a theoretical knowledge of setting-out work. "The best men who could take the lead should be taught drawing and building construction at evening classes." The technical workshop attracted men to classes. Speaking of the restrictions of the trade-unions, Mr. Colls said the paucity of bricklayers was owing partly to the union's objection to

boys working on scaffolds. He attributed the lower standard of work to the decrease of the apprenticeship system; he thought "the best way to teach bricklaying was to let the workmen work in the daytime on the scaffold, and in the evening attend classes where only theoretical instruction fully illustrated was given." It was a mistake, he contended, for polytechnics, to try to turn out finished workmen. The attempt injured the trade, and produced only a fictitious substitute for the real tradesman. He thought, on the other hand, that bricklayer labourers should be admitted to the classes, and the regulation excluding them was the cause of the thin attendance in the trade classes. It was recognised by all employers that theoretical training, however valuable, was not absolutely essential to skilled carpenters and other trades. A builder's foreman said that class-teaching did not make men better workmen; the bricklayers were less intelligent than the carpenters, as a rule, and this was owing to the absence of apprenticeship. Bricklayers could not be got to attend classes; their hands were not fit for drawing exercises and instruments. The evidence of builders' foremen follow a good deal in the same lines: there is a general agreement that apprenticeship is necessary, that those intended for foremen should attend drawing, building, construction, and geometry classes; the instruction given enabled the workman to set out his work. Mr. Rowland Plumb, F.R.I.B.A., pointed to a weak point in the modern system, when he said there was "no great incentive with regard to a young workman acquiring a scientific knowledge of his trade, as he is paid just the same rate of wages as the other men." He strongly advocated apprenticeship as an inducement to men to come to the classes. Mr. Blashill, then architect to the L.C.C., said that there was a larger number of men capable of doing good work, and he was of opinion that the building business ought to be considered as one business, all ranks learning the same as the artisans.

The conclusions to be drawn from the evidence of experts are briefly that high premiums cannot be paid by workmen unless through the City Parochial Charities Acts or Charity Commissioners. These and other charities who have funds ought to provide an entrance to a skilled trade to as many London boys of the working classes as possible. Provincial trade labour is found to be more remunerative by many employers, but is detrimental to London youths. The suggestion is made in the report that if premiums cannot be paid that would meet establishment expenses during the unremunerative years of the term, the boys should be trained in school till, say, 15, until they are skilled enough to induce employers to take them on a reasonable weekly wage. Manual training during this early period is recommended. At the elementary public school the boys should also be instructed in workshop calculations, in geometry, and technical drawing. After leaving the school, further training in workshop practice and technology of the trade might be provided in the day classes of polytechnics. Manual training in woodwork and metal would be developed. The young bricklayer and mason should also be taught the geometry of their trades, and it is thought this training would fit a boy to learn the trade methods of the workshop rapidly, and that he would be worth to his employer 10s. a week without paying a premium. The suggested scheme of higher manual instruction would be worth trying, if it did not go so far as to attempt to produce a fully trained workman.

No doubt the conditions under which the old apprenticeship system existed have passed away, or been much altered. Builders are apt to employ their own plumbers and smiths, as cited by Mr. R. Mitchell, doing away with apprentices; machine labour has

been introduced; restrictions of unions and the better all-round training of country workmen have also led to the same result. Then there is the number of openings for competent men in other situations, as in the leakage to the great world of "clerkdom," all of which causes have been detrimental to a system of skilled artisans following almost in an hereditary line.

### THE TURNER COLLECTION OF PICTURES AT THE GUILDHALL.

THESE priceless examples of Turner include a valuable collection of his drawings, on the whole a much more interesting display than is to be seen at the National Gallery. These drawings contain all that is best of the master; especially we would mention the fine architectural drawings representing York, Oxford, Salisbury, which show how dexterous a draughtsman Turner was, how accurate his perspectives were, as in that noble interior of the Chapter House, Salisbury—a wonderful water-colour drawing dated 1799, and also of the Lady-chapel of the same cathedral. The accuracy of his detail in these interiors is astonishing. One of his first water-colour drawings was a view of the Archbishop's Palace, Lambeth. A very neatly-executed drawing of Westminster, 1790, lent by the trustees of the Whitworth Institute, Manchester, and a view of Clare Hall, Cambridge, of the same year, are examples of Turner's earliest period.

But we may first refer to the oil-paintings in the lower hall of the Guildhall. "Kilgarran Castle on the Twyvey" (1), painted in 1799, is one of the earliest. In this work we find breadth of handling of masses of light and shade, and a subdued colour. Turner delighted in painting these sullen strongholds perched on hills in impregnable positions. Two other views of the same castle (Nos. 3 and 5) are hung rich in colour; in each we see his power as a painter of atmosphere, light bursting through dark clouds, and broad shadows. We can soon trace the influence of foreign travel—his first tour to France and Switzerland in 1802. His view of "Bonneville, Savoy," and "Scene in the Apennines" (11) are full of colour, tenderness, and vigour. "Dunstanborough Castle," "Conway Castle" (6), "Pembroke Castle" (114), "Fishermen on a Lee Shore" (7), are good examples of his first style. His Pembroke Castle is a wonderful example of cloud painting, with a gleam of sunshine penetrating a stormy cloud. There is movement and colour in the last named; we can see the effect of the wind, and the boat trying to push out from the shore. The stormy and threatening sky, and the warm contrast of the beach, are admirably painted. "The Nore" (15) is remarkable as a seascape; clearness, movement, colour, and vigorous technique are expressed. "The Trout Stream" (12), with sunshine bursting through an opening in the sky—a common form of cloud-painting with Turner; "The Wreck of the Minotaur" (14); "The Fifth Plague of Egypt," painted in 1800 for W. Beckford of Fonthill—a large, powerfully-painted subject-picture (9)—are remarkable. Of his second period, dating from 1810, we have pictures like Somer Hill, Newark Abbey, Walton Bridges (17, 18, 19). In these there is a more delicate sense of atmosphere and colour. Soft sunlight tones bathe the hilly green slopes and foliage and lake in the landscape of Somer Hill; the scene from Newark Abbey on the Wye is suffused in a warm glow, and the view of the Thames at Walton is full of sunlight. The view of "Mortlake," painted in 1827, is another charming, brilliant river view from the terrace of a riverside house with a screen of trees; and another example of warm evening sunlight is observed in "Barnes Terrace," painted the same year

6in. pipes, per foot run, not exceeding		s.	d.
average depth of 6ft.	.....	0	0
Ditto. ditto. 9ft.	.....	2	6
Ditto. ditto. 12ft.	.....	3	0
Ditto. ditto. 14ft.	.....	3	6
&c. &c.			
9in. pipes ditto. 6ft.	.....	2	3
Ditto. ditto. 9ft.	.....	2	9
Ditto. ditto. 12ft.	.....	3	3
Ditto. ditto. 15ft.	.....	4	0
12in. pipes ditto. 6ft.	.....	2	9
Ditto. ditto. 9ft.	.....	3	6
Ditto. ditto. 12ft.	.....	4	3
Ditto. ditto. 15ft.	.....	5	0

Providing, laying down, and jointing straight pipes, exclusive of digging:—

4in. pipe, at per foot run	s. d.
6in. ditto.	0 6
9in. ditto.	1 2
12in. ditto.	2 0

For curved and taper pipes one-half extra on above prices.

Extra only for single junctions left in straight run of pipes:—

6in. .... each	s. d.
9in. ....	0 9
12in. ....	1 6
.....	2 6

For double junctions the charge extra on single junctions for 6in. is 4d., for 9in. 8d., &c. These prices are low, as will be seen on reference to our prices given last week, and for small quantities an addition of one-half may be made.

For other materials, the same schedule puts stock bricks, delivered at works, at per 1,000	£ s. d.
No. 2 Burhams	2 15 0
Blue lias lime, per bushel	0 1 0
Ground " "	0 1 3
Dorking " "	0 1 0
Portland cement " "	0 2 0
Sand, per yard	0 4 0

Pit sand delivered in London may be put at 6s. per yard, and Thames sand delivered within two miles of a wharf is sometimes priced at 5s. 6d. per yard, and ballast at 4s. 6d. per yard for the same distance, an addition of 1s. per yard being charged for every additional mile. A barge load of sand can be brought to a river wharf at 2s. 9d. per yard, and pit sand at 3s. to 5s. per yard, to which must be added unloading and carting.

Before pricing items of digging, it is necessary to find out whether the earth is to be carted away, and how far, as this carting away is often considerable, and makes an addition of 2s. 6d. a mile per load. The contractor may do better sometimes to let the carting away at per load to some cartman at per yard cube, measured in the hole.

The presence of sand on the site will often save much carting away, as the sand and ballast can be used for concrete and brickwork, and before pricing items of excavation inquiries ought to be made as to the depth of the sand below the ground level. All above the sand has to be carted away; it may be half or two-thirds of the whole depth excavated. When sand occurs in the trenches and site considerable saving is effected, and the exact quantity of this should be ascertained before pricing, so that an allowance be made. Thus, in trenches say half-full of good sand, one half only of the quantity or of every yard would have to be carted away. The other portion will be a distinct gain. The sand would be valued at, say, 5s. 6d. per yard cube added to the saving of carting (say 2s. 6d. or 8s. per yard) so that there would be a great saving. It is better to provide that a certain sum shall be allowed by the contractor for every yard of sand found on site and used in the building.

Some useful data on excavation were given by Mr. Leaning in his valuable "Notes on Building Prices," published in the BUILDING NEWS, which are worth study by the student of prices. The hardness of the ground, the kind of labour available, depth, distance to deposit, whether basketed, wheeled, or carted, are important factors. Digging and earthwork in London are often sublet to an expert excavator who has his own appliances—such as pumps, cranes, &c.—and who can do the work better and cheaper than the builder, as the men work harder than the common labourer. The ordinary price for digging and carting is 3s. 6d. per yard. Sand, loose earth, rubbish, the cost may be put at 6d. per hour, or 2d. per cubic yard; this is the easiest kind of digging. For ordinary surface digging, the price is put at 4d. per cubic yard; for clay soil, not picked, 9d. per yard cube; for hard clay or gravel requiring picking, 10d. per yard is given; for work

on trenches, 20 per cent. is to be added. Some of these prices are rather low. Other data relating to wheeling and filling are necessary to be remembered, but the figures given in textbooks vary much. One estimate is that a man will wheel 20 yards and deposit in a day 35 cubic yards of earth; another authority says three men will remove 30 cubic yards a distance of 20 yards in a day; the latter is nearer the mark; but all such figures are misleading, and depend on the soil, the kind of run, the wheeler, and other circumstances. A wheelbarrow holds one-tenth of a cubic yard, and a dobbie cart about three-quarters of a yard. Filling and ramming may be put at 6d. per cubic yard, and wheeling and depositing at about 2d.

We may now resume the items. It is necessary to say that for small quantities of drains a percentage may be added. The trade discount off list prices of 4in. and 6in. pipes varies from 10 to 45 per cent.—the tested pipes, such as Doulton's, being the best. We have given a few items; here follow a few others:—

60ft. run 4in. drain-pipe, jointed in cement, with puddled-clay joints, trenches 4ft. deep.

Taking the trench at 2ft. wide and 4ft. deep, we get 8ft. cube at a foot long.

8ft. = 8/27 cube yard, digging, filling, and ramming at, say, 11d.	s. d.
4in. drain-pipe, per ft. run	0 3 1/2
Laying 1 1/2d., cement 1/2d., clay 1/2d.	0 4
Cost per foot	0 9 1/2

In this case we put digging at 5 1/2d., including 20 per cent. for small quantity taken, added to filling and ramming at 5 1/2d. = 11d. per cubic yard. For extra depth put 1/2d. for each foot.

35ft. run 6in. drain, jointed in cement, puddled round with clay, 6ft. deep trenches.

12ft. cube digging at 11d.	s. d.
6in. drain per ft. run	0 5 1/2
Laying 2 1/2d., cement and clay 1/2d.	0 6
	1 2 1/2

No. 6 Doulton's yard gully with cast-iron grating, bedded in cement concrete 18in. by 15in., including digging and connecting to drain.

To estimate this item, we must dissect it into its several parts. There is the digging and wheeling of earth to excavation, say 6ft. cube; concrete, say, deducting void, 2ft. 6in. Then add to this the price of gully-trap, say 6s. 9d., connecting same to drain, cement, profit, &c., say:—

6ft. cube digging and wheeling 8/27 cubic yard at 5 1/2d.	s. d.
Cement-concrete bedding, say 2ft. 6in. cube, at 12s. 6d. per yard	0 1 1/2
Gully-trap, price 6s. 9d.	6 9
Cement 1 1/2d., labour 1/2 hour	0 3 1/2
20 per cent. on digging and concrete for small quantity	0 2 1/2
	8 5 1/2

20ft. run. Strutting and planking to sides of trenches 6ft. deep and 4ft. wide.

Here one side is measured and doubled. The poling boards ("ends," as they are called) can be bought at about £6 12s. per fathom, or about 1/2d. per foot super. To this add cost of waling pieces, 2 1/2d. per foot run, and poles, 1 1/2d. per foot. Or, say:—

240ft. super. 1 1/2in. boarding, delivered at, say, 7s. 6d. per square	£ s. d.
80ft. run, two rows of 9 by 3in. waling, at 2 1/2d. per ft.	0 16 8
50ft. run struts, 3ft. apart, 1 1/2d. per ft.	0 6 2
	2 0 10
Allow 7 1/2 per cent. for one month, in use for interest on capital and depreciation, on above sum, say	0 0 3
Also removing planks and struts, at 2s. 6d. per square	0 2 0
Cartage, say	0 2 6
	0 4 9
Cost per ft. super.	0 0 0 1/2
6ft. deep on half above superficial, per ft. run, say	0 0 4

For a larger quantity of strutting and

planking the price may be rather lower (see item, p. 466). Allow for strutting and planking to basement, 30ft. by 40ft. by 6ft. deep. Allow for this item, by a similar calculation, 1d. per foot superficial.

## THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary meeting of the Royal Institute of British Architects was held on Monday evening, Mr. H. L. Florence, Vice-President, in the chair. Mr. W. EMERSON, Hon. Secretary, announced the decease of Mr. Edmond Egan, of Loughton, Associate.

### THE APPLICATION OF COLOUR TO INTERIOR ORNAMENT IN RELIEF.

Two papers on this subject were read, the one by an architect, the second by a practical decorator. In the first, Mr. H. VAUGHAN LANCHESTER, who illustrated his remarks by some large examples of actual decoration executed by Mr. Fair, observed that the question of form and relief was so frequently of first importance that he should deal with the massing and treatment both of colour and form when applied to interior decoration.

#### MODELLED WORK

as a basis for colour treatment gave a solidity and strength that enabled the painting to be kept in a more delicate key than would otherwise be thought satisfactory. The relief also was helpful in connecting the work with the mouldings and forms around it in a way that no flat-painted work could do, and if the design of the whole interior were studied by architect and sculptor in conjunction, the result should be far beyond the very frequent method by which the architect left a space here labelled "Sculpture," or a panel there marked "Painting." The sculptor or painter naturally asked for as much freedom as possible, while the tendency of the architect's idea was towards formality and symmetry. Of the spaces the architect usually put at the disposal of the decorator,

#### THE FRIEZE

was the most interesting, and offered the greatest variety in its requirements; it might consist of simple repetition of somewhat severely conventional forms, or it might teem with variety when it illustrated the great events connected with a place or a people. The frieze, however, was not always the most suitable form of decoration to adopt, and its comparatively uniform continuity of colour and modelling was not always what was most to be desired. A certain massing of either or both at intervals might, without cutting it up into disconnected panels, give the desirable suggestion of repetition to the frieze, and at the same time suggest a sense of support or connection between other portions of the whole design. This treatment suggested a greater degree of solidity and higher relief in the supporting or dividing portions, though the same end might be attained by giving them more severity of form. An uninterrupted frieze gave length to the surface on which it was placed by the horizontal stratified effect so obtained, and the more the frieze was cut up into sections, the less would the modification in proportion appear.

#### VAULTS AND CEILINGS

gave exceptional opportunities to the sculptor, though he could rarely put into them work having the same human and personal interest that the vertical surface of the wall allowed, as in most cases the decoration had to be of a more structural and conventional character. With a view to suggesting the effects that could best be aimed at in various cases, the author proceeded to consider

#### THE ACTUAL METHODS

of executing the work, and the most suitable colours and materials. The combination of relief with colour was not only valuable where the figure formed the basis of the design, but the sculptor could also deal in an interesting way with decoration based on landscape, architectural and other forms, varying according to the subject, and the dependence placed on the relief and on the colour. If the scheme of decoration were suitable, a delightful effect could be obtained by using colour very sparingly as mere suggestion—in ceilings for instance—where colouring should always be delicate, unless supported by very

strong architectural forms. Interesting effects might be obtained where it was desired to embody existing pictures or sculpture in the decoration, such works giving a note as to treatment and colour.

#### COLOURED PLASTER RELIEF.

Mr. F. LYNN JENKINS, in a second paper, also illustrated by many cartoons and examples of work, commented upon the present almost unhealthy craze for lavishly decorated buildings, remarking that each new hotel, restaurant, or place of amusement had to vie with, and, if possible, go one better in point of extravagant decoration than its predecessor, and the architect must often experience the greatest difficulty in complying with his client's demands; and sometimes at the expense of his own natural good judgment and taste, the necessity had arisen for a decorative material which should, above all, be durable and easily cleaned, varied, and rich in surface and texture, being permanently coloured to any key of brilliancy, and enriched with metals. These properties were embodied in the material known generally as coloured plaster relief work, and should prove almost sufficient reason for its production and use. With regard to the prevalent mode of decorating rooms in private houses, it was becoming more and more apparent how false a notion it was, and how extremely difficult it was to get any satisfactory effect by papering the walls and hanging pictures upon them. The revival of the old method of designing and making such decorations as were required as part and parcel of the scheme of the room was a movement the influence of which was bound to be widespread by reason of its truth of principle, and also because even the unanalytical mind would, he believed, grow to perceive its advantage without knowing why. The use of coloured relief for such purposes would often be found most serviceable. The author then described in detail the

#### MATERIAL AND METHOD OF ITS PRODUCTION,

and the plan adopted during the last three years in the working of reliefs by Mr. Gerald Moira and himself, working in collaboration, examples of their work being exhibited, including some work for the Passmore Edwards Free Library at Shoreditch, under Mr. H. T. Hare. The relief work in question could in no respect be considered according to the usual laws governing bas-reliefs, but should be modelled strictly with a view to the reception of colour. The quality of the colour depended so much on the texture of the surface underneath that it required not a little experience and many experiments to obtain good results. The peculiar properties of the material enabled the painter to get a brilliant transparency of colour on some parts to contrast with the density of others, so that there were practically no limitations to handicap him. This plastic material, not being like terracotta, fired, had the additional merit of giving exact reproduction, even to the impression of a thumb-print in the finished cast, and the objectionable glaze seen in much modern faience was entirely absent. The panels were easily removable from the wall if necessary, without damage to them. When the work was fixed complete in its position, it was carefully reconsidered with relation to its exact surroundings, and alterations could easily be effected if desired. Some special advantage was derived in coloured relief work by the collaboration of painter and sculptor. Each would exercise a wholesome restraint on the other beneficial to the work, while the joint imagination of two minds should instil a greater degree of interest.

Mr. J. M. BRYDON, in proposing a vote of thanks to Messrs. Lanchester and Jenkins, remarked that it had always been a problem with architects who were carrying out internal decorative work in houses, how to deal with colour. There was no difficulty nowadays in getting good reliefs and friezes in plaster; but the question was how to prevent the room getting dirty, and Mr. Lynn Jenkins had shown them how to obtain these decoratively coloured by the collaboration of two minds in the works. This was very well so far as it went; but architects frequently wished to suggest the application of colour to plaster work already executed; but they feared that the delicacy of modelling would be destroyed by the application of paint to the surface. He felt that all sculptured forms applied to architecture ought to be treated conventionally and with a certain reserve, and even severity, both of line and of colour, so that the work should, so

to speak, steady itself. As soon as naturalistic forms were introduced difficulties arose in treatment. From his point of view, some of the spandrels, panels, and friezes exhibited that evening in the round, and also in cartoons, were too restless for the architectural decoration of a room; but allowance should be made for the fact that they were merely sketches to small scale. In ancient buildings a magnificent effect was often obtained by the employment of gold applied to the ornament in relief, and no amount of colour was at all to be compared in effect with gilding. He would suggest that all figures should be conventionalised, that the colours employed should be reduced to very few, and that the backgrounds should be kept of one uniform tone, the result to be aimed at being a stately, broad, and majestic effect. Such a result had not yet been attained in modern work; nor did he think that it had been indicated that evening, although it had been most interesting to learn about the technique of the methods employed.

Mr. HAROLD RATHBONE, of Birkenhead, defended the high glaze adopted on his modern reproduction of Della Robbia ware, as rendering the material more permanent, and incidentally mentioned that he had not made a farthing by the revival, but had, on the contrary, sunk a large capital. He exhibited some specimens of the manufacture, and suggested it could be employed out of doors, in panels, as a contrast to brickwork. Some of the designs for friezes shown by Mr. Jenkins were, he thought, exceedingly clever, but lacking in simplicity and breadth of treatment.

Mr. E. W. MOUNTFORD seconded the vote of thanks, and pointed out that the friezes adversely criticised by Mr. Rathbone were only models to a third in scale of the executed work. He agreed with Mr. Brydon in his remarks as to the need for greater conventionality in the designs shown.

Mr. J. D. CRACE held that the friezes in modern Della Robbia ware shown would be more successful if the backgrounds had been kept uniform in tint. Too much emphasis had been laid that evening on technique; but this was, after all, of secondary importance and interest when compared with the need for definite expression in surface and line. Coloured work in fibrous plaster was not, as Mr. Lynn Jenkins seemed to think, a novelty: it had been known for more than thirty years. It was essential that the forms of coloured decoration should be sufficiently definite to be easily recognised at the distance from the spectator at which the work was intended ultimately to be seen.

The CHAIRMAN, in putting the vote of thanks, said that he should have liked to have seen work of this kind executed without any glaze, with an attempt to give something of the effect of old tapestry in the surfaces. Much of the work exhibited that evening was eminently suited for use in theatres and restaurants, but not in private houses. He saw many past Owen Jones students present, and had hoped that some would have given expression to the voices of architects on decoration; but they appeared to suffer from the shyness common to members of the profession.

Messrs. LANCHESTER and JENKINS briefly replied. The latter explained that it was not necessary to have any glaze in his relief plaster, but that an absolutely flat effect could be obtained. So far as they had been able to judge, after testing it under water, the material Mr. Moira and he were working in was very durable.

#### THE LONDON GOVERNMENT BILL AND THE R.I.B.A.

THE Council of the Royal Institute of British Architects, viewing with some apprehension certain clauses in the London Government Bill which affect the architectural profession, have respectfully drawn the attention of the First Lord of the Treasury to various points set out below, of which they urge earnest consideration. In the first place, they point out that the Royal Institute is the statutory body for the examination of district surveyors, and that the Metropolitan Fellows, all practising architects, number 295, whilst further there are 545 Associates, all engaged in the work of designing and building in London, many of these being principals.

On behalf, therefore, of a responsible and representative body, the Council of the Royal Institute most strongly urge:

1. That architects practising in London on

behalf of their clients the public would have great difficulty in complying with the by-laws made by forty different borough corporations, and that wide differences in the administration of any building laws must ensue where there is not one responsible head as at present.

2. That it is of the utmost importance for the proper carrying out of the Building Act that district surveyors should be independent surveyors, responsible only to a central authority, and not merely officials of a single corporation, and therefore subject to local control. And, further, that the supervision of buildings should continue with them, and not be deputed to building inspectors under the control of a borough surveyor or engineer.

3. That architects, having to submit their drawings for important and public buildings to the district surveyors, strongly object to subject themselves to the direction of anyone who is not a qualified and experienced architect and independent of all local influences.

4. That the administration of the London Building Act, 1894, having worked well for so many years, there is no reason for any alteration. For such a purpose London must be treated as a whole, and therefore the rules applying to the other town corporations, which are quite apart from, and independent of, each other, cannot apply to these London corporations, which are merely parts of a huge Metropolis.

5. That for the above reasons Clause 6 of the Bill be entirely omitted, and the powers under Clause 5 be strictly limited to matters which are local and not general.

6. That architects acting for their clients the public already labour under great difficulties in consequence of the very varied character of the sanitary and other by-laws at present issued and enforced by the local authorities in the London area, and that the London County Council, as the central authority, be empowered to issue to each proposed corporation by-laws as to sanitary and other matters affecting buildings which shall be compulsory throughout the whole London area.

7. That no further splitting up of: he laws affecting buildings in the Metropolis be allowed, but that rather all these be made uniform throughout the whole area affected by the Bill.

#### IMPROVEMENTS AND WORKS IN THE CITY.

THE City engineer (Mr. D. J. Ross), in his annual report to the Corporation, states that negotiations had been continued to acquire the various interests in the premises required for the widening of the southern side of Fleet-street. Several claims had been settled, and one frontage set back to the new line. The remaining claims were ready for settlement. The premises 19 and 20, Fleet-street, nearly opposite St. Dunstan's Church, being about to be rebuilt, a favourable opportunity occurred for widening Fleet-street at its western end, and the London County Council had agreed to contribute £20,000 towards the cost of widening on the south side from the City boundary to Falcon-court, which the corporation had accepted. The improvement at the western end of Cheapside, Newgate-street, and the eastern end of Paternoster-row, had occupied attention, and many interests had been acquired. All remaining claims were under negotiation. Preparations had been made for completing the Basinghall-street improvement, commenced as far back as 1861. The question of making an improvement by opening a passage-way between Draper's Gardens and Copthall Buildings had been before the Court for a considerable time, but, owing to legal difficulties, no progress had been made, and until those difficulties had been removed the matter remained in abeyance. The London County Council had declined to contribute to the widening of London-wall, on the ground that, as the land in Finsbury-circus, &c., had realised a higher price than it would have otherwise fetched owing to the intended widening, the Corporation were not entitled to compensation. With regard to the large area destroyed by the great fire in Cripplegate, when three and a half acres were demolished, the Corporation gave great attention to the question of effecting improvements. Many schemes and estimates for widening the existing thoroughfares and for forming new streets were prepared, but the London County Council had declined to contribute towards any of them. Failing in obtaining any contribution from the London County Council,

A FRENCH RENAISSANCE SIDEBOARD.

the Corporation, considering that any improvement, if carried out, would be of a Metropolitan and not a local nature, did not feel justified in proceeding by themselves. The result had been that the properties on the site had been rebuilt on the old lines of frontage, and no improvement effected. An arrangement had been made for widening Lothbury on the south side between Princes-street and the Old Jewry. The London County Council had agreed to contribute one-third of the cost of making the street 50ft. wide. The Corporation were forming a new street between Fenchurch-street and Crutched Friars 40ft. wide, the owner of the land paying £600 towards the cost, and, on the invitation of the London County Council, were contributing one-half the cost of widening Mansell-street, one of the direct approaches to the Tower Bridge. Claims amounting in the aggregate to about

£503,200 had been negotiated by the Improvements and Finance Committee during the past three years. The amount these claims were settled for was about £390,650, whilst surplus lands and other property to the value of about £96,800 had been disposed of. Beneath the City streets were 2,392 yards of subways. The lengths of gas, water, and hydraulic mains, and telegraph pneumatic tubes, and electric lighting conduits laid in them amounted to nearly ten and a half miles. Electric light and telegraph conduits contained about 440 miles of wires and cables.

## FRENCH RENAISSANCE SIDEBOARD.

THIS bold and richly-elaborated example of marquetry is also strikingly carved. Its date is about 1560, and the Cabinet may now be

seen in the national collection at South Kensington Museum. The table top measures 3ft. from the floor. Two cupboard doors and two drawers occupy the lower body of the piece, while the same order is reversed in the upper portion, the total height being 7ft. 6in. to the apex of the carving from the floor. The mouldings are delicate and refined, with egg-and-tongue enrichments round the panels of the lower pair doors, and the central parts and pilasters are inlaid with foliations which are very good in their drawing.

## IRON CONSTRUCTION IN DRAINAGE WORK.—XI.\*

By T. E. COLEMAN, F.S.I.

[CONCLUDED.]

IT has already been mentioned that iron drainage construction is much more extensively adopted in America than in this country. To some extent it is due to the different local and climatic conditions which obtain, and which also necessitate certain important differences of sanitary practice in the general scheme of domestic drainage work.

In the United States both wrought and cast iron are largely used for drain-pipes; the soil, waste, and antisiphonage pipes being also constructed of wrought iron, cast iron, steel, or brass, according to requirements. All soil and waste pipes are as a rule fixed *inside* the building, the upper ends being carried directly through the roof into the open air, whilst the lower ends are connected to iron drain-pipes in the basement. This procedure is found advisable owing to the great extremes of temperature experienced in that country, for external soil and waste pipes would be liable to be frozen in winter, whilst the summer heat would cause excessive expansion of the pipes and joints. The branch wastes from baths, lavatories, &c. (after being properly trapped under the outlet, and provided with an antisiphonage pipe), are also frequently connected to an adjacent closet soil-pipe. At the same time the whole of the soil, waste, and drain pipes situated within the building are so arranged as to be readily accessible for examination at any time, due consideration being also given to the efficient trapping and ventilation of the system.

English sanitary practice, on the other hand, requires that all soil and waste pipes shall, as far as possible, be fixed on the *outside* of the building. By this means there is a lessened risk of sewer air entering the building through defective joints and pipes, whilst the degree of heat and cold usually experienced is such that no difficulty or inconvenience is caused if the pipes are properly fixed. Entire separation between soil and waste pipes is also insisted upon, and it is further required that all waste-pipes shall, if practicable, discharge in the open air into or over a trapped gully. Complete air disconnection is thus obtained between the waste-pipes and the drainage system.

The broad differences of practice have thus been briefly mentioned; but in both countries it is necessary that the construction of all drainage work shall comply with the by-laws and regulations made by the different local sanitary authorities or city boards of health.

The following summary of the principal provisions in the plumbing and drainage regulations enforced by the "Department of Buildings, City of New York," will serve as a typical illustration of the requirements of American sanitary authorities.

## CITY OF NEW YORK.—SUMMARY OF DRAINAGE REGULATIONS, ETC.—GENERAL CONDITIONS.

Complete plans and sections (drawn to scale) of all drainage and plumbing work to be executed must first be filed and approved by the "Department of Buildings."

Written notice must be given by the plumber when any work is begun, and from time to time when the same is ready for inspection. No part of the work shall be covered until it has been examined, tested, and approved by the inspector.

## MATERIALS AND WORKMANSHIP.

All materials must be of the best quality, free from defects, and the work executed in a thoroughly workmanlike manner.

All cast-iron pipes and fittings must be sound, cylindrical and smooth, free from cracks, sand-holes, &c., and of uniform thickness. The size, weight, and maker's name must be cast on each

\* All rights reserved.

length of pipe, and must weigh not less than the following average weights per foot run:—

## CAST-IRON PIPES.

Diameter.	Weight per ft. run.	Diameter.	Weight per ft. run.
2in. ....	5½lb.	7in. ....	27lb.
3in. ....	9½lb.	8in. ....	33½lb.
4in. ....	13lb.	10in. ....	45lb.
5in. ....	17lb.	12in. ....	54lb.
6in. ....	20lb.		

The joints of all cast-iron pipes to be made gas-tight with picked oakum and fine soft molten pig lead. Each joint to have 12oz. of lead for every inch in diameter of the pipe.

All wrought-iron and steel pipes to be lap-welded and tested by the manufacturer. Each length to be galvanised, and to have the weight per foot run and maker's name stamped upon it.

The joints of all wrought-iron and steel pipes to be made gas-tight, with screwed joints properly made with red-lead. The fittings for waste and soil pipes to be heavy cast iron, recessed, and screwed drainage fittings, with smooth water-ways.

Wrought-iron and steel pipes shall not be less than the following average thickness and weight per lineal foot.

## WROUGHT-IRON AND STEEL PIPES.

Diameter.	Thickness.	Weight per foot run.
1½in. ....	14in. ....	2·68lb.
2in. ....	15in. ....	3·61lb.
2½in. ....	20in. ....	5·74lb.
3in. ....	21in. ....	7·54lb.
3½in. ....	22in. ....	9·00lb.
4in. ....	23in. ....	10·68lb.
4½in. ....	24in. ....	12·34lb.
5in. ....	25in. ....	14·50lb.
6in. ....	28in. ....	18·76lb.
7in. ....	30in. ....	23·27lb.
8in. ....	32in. ....	28·18lb.
9in. ....	34in. ....	33·70lb.
10in. ....	36in. ....	40·06lb.
11in. ....	37in. ....	46·02lb.
12in. ....	37in. ....	48·98lb.

All brass pipes for soil, waste, and vent-pipes must be of thoroughly annealed, seamless, drawn brass tubing of standard iron pipe gauge.

The connections for brass pipes, and also between brass pipes and traps or iron pipes, must not be made with slip joints or couplings. The screwed connections for brass pipe must be of the same size as iron pipe threads for the same size of pipe.

The following average thickness and weight per lineal foot will be required:

## BRASS PIPES.

Diameter.	Thickness.	Weight per foot run.
1½in. ....	14in. ....	2·84lb.
2in. ....	15in. ....	3·82lb.
2½in. ....	20in. ....	6·08lb.
3in. ....	21in. ....	7·92lb.
3½in. ....	22in. ....	9·54lb.
4in. ....	23in. ....	11·29lb.
4½in. ....	24in. ....	13·08lb.
5in. ....	25in. ....	15·37lb.
6in. ....	28in. ....	19·88lb.

Brass ferrules must be best quality, bell-shaped, extra heavy cast brass, not less than 4in. long, and not less than the following weights, viz:—

## CAST-BRASS FERRULES.

Diameter.	Weight.
2½in. ....	1lb. each
3½in. ....	1½lb. "
4½in. ....	2½lb. "

Soldering nipples must be of heavy cast brass, or of drawn brass tubing of standard iron pipe gauge. When cast, they must be not less than the following weights, viz:—

## CAST-BRASS SOLDERING NIPPLES.

Diameter.	Weight.
1½in. ....	8oz. each
2in. ....	14oz. "
2½in. ....	1lb. 6oz. "
3in. ....	2lb. "
4in. ....	3½lb. "

The use of lead pipe is restricted to the short branches of soil, waste, ventilating, or anti-siphonage pipes, bends, traps, roof connections, and flushing pipes.

All lead waste, soil, ventilating, and flushing pipes must be of best quality drawn pipe, weighing not less than the following weights per lineal foot, viz:—

## LEAD PIPES.

Diameter.	Weight per foot run.
1½in. (for flush pipes only) ....	2½lb.
2in. ....	3lb.
2½in. ....	4lb.
3in. ....	6lb.
4in. ....	8lb.
4½in. ....	8lb.

All lead traps and bends must be of the same weights as their corresponding pipe branches.

The plumbing and drainage system of every building must be entirely separate from that of every other building. The sewer connections of

every building must be made directly in front of the building, unless permission is otherwise granted. When a proper foundation, consisting of a natural bed of earth, rock, &c., can be obtained the "house-sewer" can be of earthenware pipe.

*Note.*—The term "house-sewer" is applied to that portion of the main drain or sewer extending from a point 2ft. outside the outer face of the area wall or outer front vault to its connection with the public sewer. The term "house-drain" refers to that portion of the main horizontal drain and its branches inside the walls of the building, and extending to, and connecting with, the "house-sewer."

Where the ground is made or filled in, or where the pipes are less than 3ft. deep, or where there is danger of settlement, the "house-sewer" must be of extra heavy cast-iron pipe with lead caulked joints.

The "house-sewer" and "house-drain" must be not less than 4in. in diameter where water-closets discharge into them. Where rain-water discharges into them, the size of the "house-sewer" up to the rain-water connections must be in accordance with the following table, viz:—

## SIZE OF DRAINS RECEIVING RAIN-WATER.

Diameter.	Fall.	Maximum Drainage Area.
6in. ...	1in. per foot run	5,000ft. super.
	1in. " "	7,500ft. "
7in. ...	1in. " "	6,900ft. "
	1in. " "	10,300ft. "
8in. ...	1in. " "	9,100ft. "
	1in. " "	13,600ft. "
9in. ...	1in. " "	11,600ft. "
	1in. " "	17,400ft. "

The "house-drain" and its branches when underground must be of extra heavy cast iron, and when above ground must be of extra heavy cast iron, or galvanised wrought iron, or steel.

The "house-drain" must properly connect with the "house-sewer" at a point 2ft. outside of the outer front wall or area wall of the building. An arched or other proper opening must be provided for the drain in the wall to prevent damage by settlement.

The house drain and sewer must be run as direct as possible, with a fall of at least 1in. per foot run. All changes in direction to be made with proper fittings, and all connections made with Y branches and 1/4th and 1/8th bends.

If possible the house-drain must be above the cellar floor, and supported by brick piers at intervals of 10ft., or suspended or otherwise supported by heavy iron pipe-hangers, spaced not more than 10ft. apart. The use of pipe-hooks for supporting drains is prohibited.

An iron running trap must be placed on the house-drain near the wall of the house, and on the sewer side of all connections. If placed outside the house or below the cellar floor, it must be made accessible in a brick manhole fitted with an iron or flagstone cover. The house-trap must have two clean-outs with brass screw-cap ferrules caulked in. When fixed outside the house, it must be not less than 3ft. below the surface of the ground.

A fresh-air inlet must be connected with the house-drain just inside of the house-trap, and will be constructed of heavy cast iron where underground. Where possible it will extend to the outer air, and finish with a return bend at least 1ft. above ground, and 15ft. away from any window or furnace cold-air box. When this arrangement is not possible, the fresh-air inlet must open into the side of a box not less than 18in. square placed below the side-walk, at the curb. The bottom of the box must be 18in. below the underside of the fresh-air inlet-pipe. The box may be of cast-iron, or constructed of brick-work or flagstones in cement. It must be covered by a flagstone fitted with movable metal grating, leaded into the stone, having openings equal in area to the area of the fresh-air inlet-pipe.

For drains up to 4in. in diameter, the fresh-air inlet-pipe must be of the same diameter; for 5in. and 6in. drains it must be not less than 4in. in diameter; for 7in. and 8in. drains not less than 6in. in diameter; and for larger drains not less than 8in. in diameter.

All yards, courts, and areas must be drained, and when sewer-connected must have connections not less than 3in. in diameter.

When rain-water pipes are fixed inside buildings they must be constructed of cast-iron, wrought-iron, or steel, with roof connections, made gas and watertight by means of a heavy lead or copper drawn tubing wiped or soldered to a brass ferrule or nipple caulked or screwed

into the pipes. They must be trapped with cast-iron traps, so placed as to prevent freezing. Rainwater-pipes must not be used as soil, waste, or vent-pipes, nor shall soil, waste, or vent-pipes be utilised as rainwater-pipes.

Cellar drains will only be permitted when they can be connected to a trap with a permanent water-seal.

Sub-soil drains should discharge into a sump or receiving tank, the contents being lifted or discharged into the drainage system above the cellar bottom by some approved method. Where directly connected to a sewer, they must be cut off from the rest of the plumbing system by a brass flap-valve on the inlet to the catch-basin, whilst the trap on the drain from the catch-basin must be supplied with water, as required for cellar-drains.

## SOIL AND WASTE PIPES.

All main soil, waste, vent, or antisiphonage pipes must be of iron, steel, or brass. When they receive the discharge from fixtures on any floor above the first, they must be carried full bore to a height of at least 1ft. above the roof coping and well away from all shafts, windows, chimneys, or ventilating openings. When less than 4in. diameter, they must be enlarged to 4in. at a point not less than 12in. below the roof surface by an increaser not less than 9in. long.

No caps, cowls, or bends shall be affixed to the top of such pipes. In tenement-houses and lodging-houses wire baskets must be securely fastened into the opening of each pipe that is in an accessible position.

All pipes issuing from extensions or elsewhere, which would otherwise open within 30ft. of the window of any building, must be extended above the highest roof and well away from and above all windows.

All pipe lines must be supported at the base on brick piers, or by heavy iron hangers from the cellar ceiling beams, and throughout their length by heavy iron hangers, at intervals not exceeding 10ft. The whole of the pipes and traps should, where possible, be exposed to view, and should always be readily accessible for inspection and repairs.

No trap must be placed at the foot of main soil and waste pipes. Soil and waste pipes must not be less than the following sizes, viz:—

## SIZE OF SOIL AND WASTE-PIPES.

Description.	Minimum Diam.
Main soil-pipe .....	4in.
Main waste-pipe .....	2in.
Branch soil-pipe .....	4in.
Branch waste for laundry tubs .....	2in.
Branch waste for kitchen sink .....	2in.
Soil-pipe for w.c.'s on five or more floors ...	5in.
Waste-pipe for sinks on five or more floors ...	3in.

Branch soil and waste pipes must have a fall of at least 1in. per foot run. All traps must be protected from siphonage and back pressure, and the drainage system ventilated by special lines of vent-pipes.

## VENT-PIPES.

All vent-pipe lines and main branches must be of iron, steel, or brass. They must be increased in diameter and extended above the roof as required for waste-pipes. They may be connected with the adjoining soil or waste pipe line well above the highest fixture, but this will not be permitted when there are fixtures on more than six floors. All vent-pipe lines must be connected at the bottom with a soil or waste pipe or drain in such a manner as to prevent the accumulation of rust scale. Branch vent-pipes should be connected as near to the crown of the trap as possible.

Vent-pipes must not be less than the following sizes, viz:—

## SIZE OF VENT-PIPES.

Description.	Minimum Diameter.
Main vents and long branches .....	2in.
For w.c.'s on 3 or more floors .....	3in.
For other fixtures on less than 7 floors .....	2in.
Ditto. ditto. 7 to 8 " .....	3in.
Ditto. ditto. 9 to 15 " .....	4in.
Ditto. ditto. 16 to 21 " .....	5in.
Ditto. 22 floors and upwards .....	6in.
Branch vents for traps up to 2in. diam. ....	1½in.
Ditto. exceeding 2in. diam. ....	2in.

Earthenware traps for water-closets and slop-sinks must be ventilated from the branch soil or waste pipe just below the trap. Earthenware traps must have no vent-horns.

## PLUMBER'S TRAPS.

Every fixture must be trapped as close to the outlet as possible, and all traps must have a water seat of not less than 1½in. The discharge

from any fixture must not pass through more than one trap before reaching the house-drain.

All fixtures, except water-closets and urinals, must have strong metal strainers over the outlets, to prevent obstruction of the waste-pipe. Iron traps to water-closets and other fixtures must be porcelain-lined.

All accessible traps, except water-closet traps, must have brass screw cleaning eyes. The screw caps must be not less than  $\frac{1}{4}$  in. thick; whilst the body of the clean-out ferrule must be equal in weight and thickness to the caulking ferrule for the same size of pipe. Traps must be self-cleaning, and without interior mechanism. No mason's, cesspool, bell, pot, bottle, or D-trap is permitted.

Traps must not be less than the following sizes,  
viz. :—

SIZE OF PLUMBER'S TRAPS.		
Description.	Minimum Diameter.	
Traps for water-closets	.....	4in.
" alop-sinks	.....	2in.
" kitchen sinks	.....	2in.
" wash trays	.....	2in.
" urinals	.....	2in.
" other fixtures	.....	1½in.

Overflow pipes must in all cases be connected on the inlet side of traps.

All earthenware traps must have heavy brass floor-plates soldered to the lead bends, and bolted to the trap flange, and the joint made gas-tight with red or white lead. The use of rubber washers for floor connections is prohibited.

Safe waste-pipes must be of galvanised iron not less than  $\frac{1}{2}$  in. in diameter, and having lead branches of the same size, with strainers soldered thereto. Safe waste-pipes must not be directly connected to any part of the plumbing system, but must discharge over an open ordinarily-used sink or upon the cellar floor, and have brass flap-valves at their lower ends. The branches on vertical safe waste-pipe lines must be made with Y fittings, and carried up to the safe with as much pitch as possible.

FIXTURES.

Water-closets must be set on marble, slate, or tile, and the back and ends of the apartment made waterproof with some similar non-absorbent material. Closets must be set open and free from all inclosing woodwork, and provided with earthenware flushing rim-bowls. Pan, valve, plunger, and other water-closets having an unventilated space, or whose walls are not thoroughly washed at each discharge, will not be permitted.

Water-closets and urinals must be flushed from a separate cistern, the water from which is used for no other purpose. They must never be connected directly with, or flushed from, the water-supply pipes.

Iron water-closet cisterns and automatic urinal cisterns are prohibited. The copper lining of water-closet and urinal cisterns must not be lighter than 10oz. copper. The overflow from cisterns may discharge into the bowls of the closet, but must in no case connect with any part of the drainage system.

The flushing-pipes to water-closets must be not less than 1½ in. diameter, and if of lead, must weigh not less than 2½ lb. per foot run. Urinal flush-pipes must be not less than 1 in. in diam., and where lead is used, must weigh not less than 1 lb. per foot run.

Latrines, trough-closets, and similar appliances can only be used by special permission.

Urinals must be constructed of materials which are impervious and non-corrosive under the action of urine. The floor and walls of the compartment must also be lined with similar materials.

## WATER SUPPLY.

All water-closets and other plumbing fixtures must be provided with an adequate supply of water. When the water pressure is insufficient to supply freely and continuously all fixtures, a house-supply tank must be provided of sufficient size to afford an ample supply of water at all times. The tank must be fixed in an approved manner, and provided with a cover to exclude dust, &c. The overflow-pipe must not be connected to any part of the plumbing system, but must discharge on to the roof where possible.

No service or supply pipes, tanks, flushing stems, or water-supplied fixtures should be placed where they will be exposed to frost. Where so placed they must be properly packed and boxed to prevent freezing.

## TESTING.

The entire plumbing and drainage system within the building must be tested by the plumber, in the presence of a plumbing inspector, under a water or air test, as may be directed. All pipes must remain uncovered in every part until they have successfully passed the test. All openings must be securely closed, as required by the inspector, and the use of wood plugs for this purpose is not permitted.

The water test is applied by closing the lower end of the main house-drain and filling the pipes to the highest opening above the roof with water. Where any portions of the drainage system are separately tested there must be a head of water at least 6 ft. above all parts of the work so tested, and special provision must be made for including all joints and connections in at least one test.

The air test is applied with a force pump and mercury column under 10lb. pressure, equivalent to a height of 20in. of mercury. Spring gauges are not permitted to be used.

When the work is finally completed and the traps of the fittings filled with water, the plumber must make a peppermint or smoke test in the presence of a plumbing inspector, and as may be directed by him. The materials and labour for the tests must be provided by the plumber. Where the peppermint test is used, 2oz. of oil of peppermint must be provided for each line of pipes up to five stories in height, and for every additional five stories in height (or fraction thereof) one additional ounce of peppermint must be provided for each line of pipes.

From the foregoing particulars respecting the plumbing and drainage regulations for New York it will be seen that the supervision exercised by the city authorities is of a very stringent and searching character. Considering the great height of many American buildings, and the fact that the soil, waste, and drain pipes are largely fixed inside the houses, such construction particularly calls for materials and workmanship of the highest class, so that the sanitary efficiency of the whole may, as far as possible, be permanently insured.

BUILDERS' CLERKS' BENEVOLENT  
INSTITUTION.

THE twenty-first anniversary dinner of this deserving charity was held at the King's Hall, Holborn Restaurant, on Tuesday evening. The President, Mr. Alfred F. Randall (Messrs. Randall and Kirk, of Woolwich) occupied the chair, and was supported by over 290 friends and supporters of the institution. The usual loyal and patriotic toasts having been given, that of "The Navy, Army, and Reserve Forces" having been proposed by Mr. Downs and acknowledged by Major Marshall, the President proposed the toast of the evening, "The Builders' Clerks' Benevolent Institution." Prefacing his appeal with a few remarks as to the origin and object of the institution, the President explained that the charity was thirty-three years old, having been commenced in 1866 in a very small way by its founder, the late Mr. Thomas Peto Ward. The object then as now was the granting of pensions or temporary relief to decayed or distressed builders' clerks or their orphans, and for the maintenance and education of their orphans. That aim has been realised, and had been adhered to and carried out in a greater degree perhaps than its founder could have foreseen. In the first year (1868) that relief was given, the amount so expended was £12 15s., whereas last year the amount so distributed was £504, and to this should be added £102 working expenses, making a total spent of £606. The entire amount in relief since 1868 was no less a sum than £17,336, and this spoke volumes as to the necessity and usefulness of such an institution. Last year saw the largest sum paid in temporary relief, many most distressing cases presenting themselves to the committee, who made it an invariable rule to enquire without delay into the cases before them, and to afford relief promptly. He could speak from personal observation on this point, for at the meeting he attended two pressing appeals came before them, and two members of the committee at once volunteered to visit and deal with the cases the next morning. The institution not only offered relief to subscribers, but had given aid to those who had not paid a penny towards its funds, and also to the widows and orphans of non-subscribers. But those clerks who had subscribed were credited with ten votes at any election for each

guinea they had ever given. He was rather surprised to hear that some clerks preferred to subscribe to the Odd Fellows or kindred societies; but he could not see the advantage, for while from those societies they derived benefit only when they were ill, and when dead friends could draw some £10 or £12 to bury them, with that institution pensions and relief were given when a man was past his work, and the committee were empowered to pay as much as £10 for temporary relief. There were at present 21 pensioners, and two children at the Orphan Working School, and there was a vacancy for another duly elected builders' clerks' orphan. In appealing for liberal subscriptions, the president remarked that this was the coming-of-age dinner, while they had 21 pensioners, their office was at 21, New Bridge-street, the committee, with their treasurer and secretary numbered 21, and to any guest who entertained doubts in his mind as to the amount he should give that evening, he would call attention to the suggestive sequence of five twenty ones, which might be translated into shillings with great advantage to the institution. Mr. Costigan, in giving "The Architects and Surveyors," urged the claims of the institution on the profession, and Mr. Benjamin Tabberer, in his reply, said both contractors and surveyors were under a debt of gratitude to builders' clerks for their able service. The remaining toasts were "The Builders," proposed by Mr. W. Turnbull Tonkin, and responded to by Mr. Downs; the "Builders' Merchants," proposed by Mr. Joseph Randall (past president, and father of the chairman), who urged that the institution ought to be more liberally and widely supported by the builders' clerks themselves, of whom not a tithe of the 4,000 in London alone contributed to its funds, an appeal endorsed by Mr. Barrett in his response, and "The President" was given by Mr. Costigan, and acknowledged from the chair. In proposing the health of "The Past Presidents," Mr. Edwin Brooks, treasurer, referred to the great loss the institution had sustained by the death, by accident, of their indefatigable and genial secretary, Mr. H. J. Wheatley. He coupled with the toast the name of Mr. R. C. Foster, of Messrs. Foster and Dicksee, of Rugby, who, in responding, referred to the great assistance he had received during his occupancy of the presidential chair last year from Mr. Wheatley, who always worked very hard on behalf of the institution. At the close of the proceedings, Mr. John Austin, the secretary, read a long list of donations and subscriptions amounting to over £200, headed by £25 from the President.

PARIS: ITS COMING EXHIBITION.

**M**Y last jottings, entitled "International Exhibitions: a Retrospect" (March 24), were simply a stringing together of some personal reminiscences of various international exhibitions; remembrances that had the perhaps questionable merit of extending over the lengthened period of nearly half a century. To-day, we will devote ourselves to present surroundings, more especially as to the way they suggest future success or non-success for next year's much-talked-of exhibition. Up to date, the long-suffering British taxpayer has found a distinct difficulty in learning anything official or definite about the coming show. True, a Royal Commission for the Paris Exhibition exists at St. Stephen's House, Westminster, S.W.; but intending exhibitors, or others interested, are unable to obtain there any really serviceable information. Hence, he being best served who serves himself, it so came about that the writer finds himself upon the site of the actual exhibition whilst penning these lines.

Before leaving England, an application was made for official permission to view the grounds ; but Mr. Herbert Jekyll, the secretary to the Commission, promptly replied, that, with regret, he was "unable to forward a pass to visit the works, as the French authorities are extremely unwilling to grant passes to anyone for this purpose." This blunt refusal to permit an old exhibitor to scan the nakedness of the land looked distinctly ominous. But, nowadays, if one means towards a given end does not succeed, there generally is, and always ought to be, another string to one's bow, and so, armed with an introduction to our Ambassador at Paris from a popular member of Parliament, the voyage across the Channel was made.

Are fogs increasing in area? When a lad, I recollect it was generally supposed they were

confined to London. Nowadays they seem to be everywhere! Naturally, we left Southampton in a thick fog, so dense, indeed, that one could not see half-a-dozen yards ahead. Last summer, coming out of the Indian Ocean and turning northward around Cape Agulhas, we found Table Bay wrapped in a fog as opaque as one expects to find on the Thames in mid-November. And there, too, we had to lie all night ere we could go ashore at Cape Town—all on account of the fog! And so in this, one's most recent experience, after infinite delay, we came into Havre in a fog, reached St. Lazare Station in a fog, and found ourselves at Paris (just six hours' late) enveloped in fog. And, although this may be anticipating—it seems to the unsophisticated eye—the French authorities themselves are pretty much in a fog, too, over this much-vaunted, but at the present time anything but promising-looking, Exhibition for A.D. 1900.

By the way, St. Lazare Station is known to many thousands of one's fellow-countrymen; but how many of those who hurry through its portals one way or the other ever give a thought as to whose honour the terminus is named? Was it S. Lazarus, of Constantinople, that devoted 9th-century ecclesiastical artist and priest who, we are credibly informed, after his hands were cruelly burnt off, was such an enthusiast that he continued to sketch clever pictures for the decoration of churches with his mauled stumps, somewhat after the fashion of the armless prodigy who, years ago, used to sit on City-road Bridge, E.C., and paint portraits with the brush held between his toes? Or, was it S. Lazarus, known as the Friend of our Lord? Probably this latter was the celebrity, for his story is incorporated with early French history—Lazarus, the Jew, it may be remembered, once lived at Marseilles; crossing, to reach there, the fitful Mediterranean, which sea the Italians cynically liken to a beautiful woman, for they say you can never depend upon either! There he ultimately became bishop, and so ascetic a one that he seldom walked abroad without carrying his own coffin with him upon his shoulders. Methinks, had he been here to-day in Paris—foggy as it is—the chances are he would have been a-coughing himself!

But to resume! At the British Embassy, it was announced our Ambassador was laid up with influenza, and Mr. Aston Lee, his right-hand, to whom I also held an introduction, was ill of the same complaint. Through the kindness of the Hon. Maurice Baring (whom I last met as a dear child of eight summers, and is now an Attaché as tall as a Life Guardsman) a letter was procured to Mr. George Spearman, the English official now in charge of Great Britain's interests at the coming Exhibition of 1900.

But here one's troubles only practically commenced! Exhibitors at Chicago will remember grimly the vexatious experiences endured, both before the opening and after the closing of the World's Fair, whenever an official's aid had to be secured. There, red tape tied up everything; and what with the Customs and each individual building being in bond by itself, the Columbian Guards anxious to show off their newly-acquired powers, and the powerlessness of the overwrought and utterly bewildered freight officials, life was hardly worth living. The worst of it all was, in those days—after floundering through acres of mud and experiencing perils galore whilst threading one's way over countless temporary railroad lines, and amidst moving freight-trains steaming and shunting in all directions—the right place found, it was generally a matter of the last straw breaking the camel's back. Yes! Nine times out of ten, the official's office gained, the sanctum would be seen closed, and a paper pinned upon its door reading "Gone to Lunch." With the Chicago officials, in truth, it was generally "gone to lunch"—morning, noon, and night!

If coming events cast their shadows before, things in the above respect at Paris are likely to be as bad next year as Chicago was in 1893! Our British Commission offices are at present situated at 27, Avenue de la Bourdonnais, a street flanking the Paris side of the Champ de Mars, the Avenue de Suffren being on the opposite one. It was in the latter thoroughfare, indeed, almost exactly opposite, that the late Sir Cunliffe Owen's offices stood in 1878. A prompt visit to Mr. Spearman's chambers resulted in the information that the gentleman in question would not be there that particular morning. Between eleven and twelve the next day was suggested by the good-natured but quite irresponsible assistant

in charge, as possibly a likely time to find him. The second visit proved equally unsuccessful; but on calling the third day the precious if not overworked official was run to earth, and being caught, he proved useless. He "knew nothing, and could do nothing!" he said. "But," he assured me, "there are at least 6,000 men at work upon the grounds," although as a matter of fact, with the naked eye I could not see 600. "This," he added, with impressive dignity, as he twisted his wax-ended moustache reflectively, "is going to be the largest thing the world has ever produced." One could not help looking wonderingly for a moment to see whether the man was really serious, and the response came naturally, as one glanced out of the window and viewed the landscape o'er, "Then where is it all going to be?" "Here," he said, somewhat grandiloquently, thinking, perhaps, from my appearance he was addressing a simple Englishman taking his first trip abroad, "in the Champ de Mars opposite, and in the Esplanade des Invalides." "But," was my natural retort, "the Champ de Mars means merely an area of some 3,000ft. by 1,500ft., and the other place measures only 1,500ft. by 800ft. at the outside, less than a third the size of the Champ de Mars even! The World's Fair at Jackson's Park, Chicago, was about two miles long and three quarters of a mile wide. When our American cousins come here they will simply laugh at you." "Well, well," he replied, qualifying himself, "I meant this would be the greatest exhibition Europe has ever seen!" This, no doubt, may prove to be the case; but from present appearances, it bids fair to be a very poor second—anyways as regards size—to Chicago. As to landscape gardening, Paris will have scarcely any room at all to show what she can do. Americans, on the other hand, at Chicago, had ample scope to excel themselves in that beautiful art.

There is nothing imposing about the offices of our British Commission in Paris. They consist of a couple of rooms immediately over Pitt's snug little "Star Bar," on the window of which a notice tells the thirsty world Bass and Co.'s Ale and Stout can be had within on draught. Just above are the Royal Arms, over which our British flag floats fitfully, and he who runs may read the announcement: "Commissariat Royal Britannique pour Exposition de 1900." At the side door are two notices, one reads: "Paris Exhibition 1900, British Commission au 1er Etage," and the other, opposite to it: "Grand et Petit Appartement. Logement à Louer." On the front of this six-storied stone building, incised in the ashlar face, occurs (tombstone fashion): "Bastouil Jne., architect, 1881." It is curious that so many ordinary and most commonplace new residences in Paris bear the names of their architects cut in conspicuous places upon them. Nearly opposite the Star "pub." (or rather "Royal Britannique" headquarters) stands the Eiffel Tower, in the midst of chaos, and looking uglier than ever in its dingy chocolate coat. Patches, a dozen yards square or so have just been coloured, respectively, white, blue, and orange, as samples for the general repainting. The latter tint, it is understood, has been finally adopted.

"What is already done on the Champ de Mars?" some reader may ask. The answer is, "Very little. At the top end of the place, facing the Ecole Militaire, one's old friend the Machinery Hall still stretches its full width (500 yards), and a number of iron girders have been erected parallel with the Avenues de la Bourdonnais and de Suffren. These will presumably carry the two main buildings. That, generally speaking, comprises all accomplished at present. Seen from the dreary height and waste upon the top of which the Palais de la Trocadéro stands (the stonework of the latter already very much the worse for wear), the space below looks practically a desert. Here and there a small group of workmen may be espied engaged in their labours; but any appearance of bustle or energetic labour is conspicuous by its absence.

The Swiss "sideshow," situated just outside the Champ de Mars, at the corner of the Avenues de Suffren and La Motte Picquet (close to the Big Wheel), appears to be the most advanced of anything. It is a labyrinth of skeleton wood-framing, reminding one just now of a back view of that old-time stirring spectacle, "The Siege of Gibraltar," shown nightly at Vauxhall Gardens in the '40's and early '50's, or of—more recently—(seen from the same point of

vantage)—the "Taking of Sebastopol by the Allies" at Belle Vue Gardens, Manchester.

Many may remember the steep fall of land from the Place du Trocadéro down to the Quay Debilly, the embankment that runs along the Seine side? All the small houses that fringed the slope between the latter and Rue Franklin above have been cleared away. The land has been made up to two levels, and thereupon a speculative company are building quite a colony of huge mansions. The site is, undoubtedly, most commanding; but in spite of the soil being of so shifty a character, these lofty stone edifices are going up with scarcely an apology for any foundations underneath them.

The works upon the Esplanade des Invalides are in a more advanced state than are those on the Champ de Mars, and excavations and iron girders are in evidence at every hand. The permanent buildings for the Fine Art Department are on the Paris (proper) side of the Seine, between the Champs Elysées and the river, and nearly opposite the Invalides. Built of very white stone, the piers are now up to the parapets. The French fashion of fixing unworked stone in block, of course, leaves considerably more masonry to do than would be the case with a building so far advanced in point of erection in England. A number of large Composite capitals, however, have been carved on the banker, instead of *in situ*—rather a departure from the usual French way of doing work. The blocks of stone carted on to these works are immense, much larger than anything usually seen in England. Immediately opposite the middle of the Esplanade des Invalides a new iron bridge has been thrown across the river, here 300ft. or thereabouts wide. It consists of a single span, and is considerably wider than is any other bridge at present spanning the Seine. The banks of this river are to be largely utilised for exhibition purposes, especially between the Pont des Invalides and the Pont de l'Alma. Within this area (upon the Quai d'Orsay side) the street of pavilions representing the various Great Powers is to be built. Great Britain will occupy the central place. It is to be hoped the mistake made with Victoria House at Chicago's World's Fair will not be repeated at Paris. At Chicago, the British Pavilion was the only representative house not open to visitors generally. Indeed, it was practically closed to everyone—a humiliation and characteristic example of our fellow-countrymen's exclusiveness, pointed to, unfortunately, by the finger of scorn by all the world. Every Englishman in Chicago, save and except those composing the actual Royal Commission itself, was heartily ashamed of the latter's action in that particular matter.

The underground railroad running by the Seine side will connect the Esplanade des Invalides with the Champ de Mars (a distance of about three-quarters of a mile), and seems to be making fair headway. These two quadrilateral exhibition spaces, inclining inwards on plan, are naturally much nearer each other at the Ecole Militaire and Invalides end than they are by the river. The respective entrances at the latter points are only a quarter of a mile apart, and are directly connected with each other by the Avenue de la Motte Picquet.

And now to summarise all in twenty-one words. Up to the present date, the works connected with the great French Exhibition are, as seen by an outsider, distinctly disappointing.

Rue de l'Arcade.

HARRY HEMS.

#### SELF-KEYED WOOD-BLOCK FLOORS.

MESSRS. B. WARD AND CO., of 15, Great George-street, S.W., are sending out an admirably-arranged specimen-card of their new system of self-keyed wood-floor blocks, which architects and builders will do well to send for. No discs, disc-keys, or wood or metal dowels are necessary with this system, each block being keyed *all round* to the adjoining blocks, in an ingenious and thoroughly effective fashion.

The flooring is manufactured in yellow deal, pitch pine, oak, maple, teak, and jarrah, and the work is laid in special mastic, and its durability guaranteed. A number of suitable designs are illustrated on the specimen-card. Messrs. B. Ward and Co. claim this is the cheapest *keyed* floor in the market.

The rural district council of St. Austell have instructed Mr. Andrew, C.E., to prepare plans for works of sewerage at Mevagissey.

## Building Intelligence.

**FELLING.**—St. Patrick's Church, Felling, near Newcastle-on-Tyne, has been further beautified by the completion of one of the side chapels, and an altar has been erected, and will shortly be dedicated to "The Sacred Heart." The work throughout is executed in polished marble and alabaster, and includes a new pavement and altar-table surmounted by a reredos, and the side walls have been lined with coursed ashlar work of alabaster. The whole work has been specially designed and executed by Messrs. Tully and Sons, Ltd., of Newcastle-upon-Tyne, who also executed the alabaster pulpit erected in the same church some little time ago.

**KENDAL.**—The Roman Catholic schools in Gilligate were opened last week. Accommodation is provided for 500 children, who will be seated in dual desks. One of the classrooms is so arranged that it can be used as a stage for plays, it being raised 3ft. 6in. from the main schoolroom floor. There are separate entrances, cloak-rooms, and lavatories for the boys, girls, and infants. The schools are heated by hot water. The architect is Mr. John Stalker, M.S.A., of Kendal.

**NEWPORT, N.B.**—Last week the students' section of the Dundee Institute of Architecture visited the Vickersford Cemetery, Newport, and inspected the Leng memorial chapel erected there. Mr. T. Martin Cappon, F.R.I.B.A., president of the institute and architect for the chapel, met the students and explained that the plan of the chapel was very similar to the smaller chapels very often attached to cathedrals in France. The plan shows a chapel proper and vestry, with cloister on one side. The style is Decorated Gothic, with a feeling of earlier work, great variety being introduced into the details of the leading features, all the windows, for example, differing in design. The apsidal end of chapel is divided into five bays by massive buttresses. The cloister is of three bays divided by buttresses and surmounted by crocketed gables. The interior, which is finished in Caen stone, with vaulted ceiling, is simpler in treatment. The side walls are divided into four bays by moulded responds, from which spring the vaulted ceiling, the space between window-sills and floor being left plain for the introduction of memorial tablets, brasses, &c. The floor is finished in mosaic, while the doors are of oak with wrought-iron hinges. The carving was executed by Mr. James Bremner, sculptor.

**NOTTINGHAM.**—New premises in Parliament-street to be used as carriage works and horse repository have been opened this week. The site comprises an area of 1,324 square yards, with frontages to Parliament-street and Lincoln-street. The provision on the ground floor is 67 standings and loose boxes, in addition to showroom for carriages and harness and offices, with electric hoist 16ft. by 8ft., to take carriages from this floor to the stores and workshops. The walls are lined with glazed bricks, and the fittings supplied by Messrs. Musgrave and Co. The cost of the alterations has been upwards of £10,000. Messrs. Brewell and Bailey, of Nottingham, were the architects, and Messrs. Dennett and Ingle, of the same city, the contractors.

**PERTH.**—The new Congregational Church was opened on Saturday. It is built of red stone, and is Decorated Gothic in character. The internal dimensions are 51ft. by 44ft., with a slight incline upon the floor. There are circled seats at each side underneath the gallery. Immediately behind the pulpit is erected an organ, built by Messrs. Wadsworth Brothers, of Manchester and Aberdeen. The choir platform, in front of the pulpit, is 6in. higher than the church floor. The gallery is of a horseshoe pattern, with passage running round each side. The woodwork throughout is of yellow pine, stained and varnished. The church is heated with hot-water pipes on the low-pressure system. The building is seated for 650. At the back are the vestry, session-house, 24ft. by 15ft., and over there is a hall seated for 300 people, with platform at one end. The architects were Messrs. Steel and Balfour, Glasgow; while Mr. George Henderson was the clerk of works.

**YATE.**—The parish church of Yate, Somerset, was reopened on Friday after restoration, carried out at a cost of £3,000. The 15th-century tower, left unfinished since the time of Henry VII., has

been completed. The plaster ceilings have been removed, and the oak wagon roofs uncovered and renovated. These roofs are of five or six distinct designs and periods. The porch has been partly taken down and rebuilt, and all the foundations and walls made secure. The contractors for the works are Messrs. Cornish and Gaymer, of North Walsham, who carried out the designs of Mr. W. D. Carte, F.S.A., architect to the Ecclesiastical Commissioners.

### CHIPS.

The column recently erected in the village of Llanarmon to the memory of the late John Parry, anti-tithier and land reformer, was unveiled on Thursday afternoon in last week. The column, which is of red Aberdeen granite, standing 17ft. high, was erected by public subscription.

The Wesleyan Chapel at Burnham Market, Norfolk, was reopened last week after renovation, including reseating in pitch-pine, reflooring, new pulpit, and windows. Mr. Carter, of Cromer, was the architect, and Messrs. Rolling and Southgate, of Rudham, were the builders.

Herr Paul Wallot, the architect of the new Parliament Building in Berlin, which is now being decorated, has resigned his appointment in consequence of the rejection by the Building Committee of a picture executed by Franz Stuck, of Munich, at a price of £1,500. Herr Wallot has been receiving a retaining fee equal to £500 a year for superintending the decorative work in the new building.

Enlargements of Charing Cross Station, estimated to cost £500,000, are contemplated by the South-Eastern Railway Company. Provided Parliamentary powers are obtained, it is proposed to construct on the western side of the station, on land now occupied by properties in Craven-street, two additional main lines, with direct outlets to Craven-street and the Embankment. It is also proposed to lay down two new lines for suburban traffic on the eastern side of the station.

The business at Tokenhouse-yard last week, although confined to two days only, was fairly brisk, a large number of properties of the smaller class being disposed of. There was a good demand for reversions and policies, whilst the only landed property placed upon the market was sold, this comprising a farm at Standon, in Hertfordshire, which realised nearly £17 per acre. Together the returns for the two days amounted to £37,711, which is below the corresponding holiday week of last year. The total sales for March amounted to £581,823, as against £817,000 for the same month of 1898, the difference being due to the short supply.

The Queen has again altered the date for laying the foundation-stone of the new museum buildings at South Kensington, for which Mr. Aston Webb, A.R.A., is the architect. The ceremony is now arranged to take place on Wednesday, May 17th.

On Saturday morning a fire occurred in the Dalmarnock district of Glasgow, whereby damage was done to the amount of £3,500, and about 130 persons will be thrown temporarily out of employment. The outbreak took place in the Springfield Chair Company's works, a three-story brick building, which was destroyed. The machinery, valued at about £1,500, was ruined.

Mr. Alex. R. Stenning, F.S.I., has been appointed J.P. for the county of Sussex.

The new workhouse infirmary, Ford, Devonport, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke-flues, patent Manchester grates, and Shorland's patent exhaust roof ventilators and inlet tubes, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The east room of the Criterion Restaurant, Piccadilly-circus, was reopened on Friday, alterations which have been carried out in that and other parts of the building during the past nine months having been completed. A minstrel's gallery of gilt hammered iron has been constructed across the main vestibule, from which the music of the band can be heard in all the rooms on the ground and first floors. The vestibule itself has been enlarged and made into a lounge, while the east room has been reconstructed, the windows have been lowered to the level of the floor, balconies added, and the walls panelled with silk, alternating with mirrors. The west room has also been extended, remodelled, and decorated. A new entrance has been provided in Jermyn-street.

An accident at Pethick Bros.' granite quarries on Saturday resulted in the death of Mr. Sampson Gill, foreman of gangers, aged 75 years. Whilst a gang of men under his direction was removing a block of granite weighing 60 to 70 tons, the mass slipped, and before Mr. Gill could remove to a place of safety it had crushed him beneath it.

## Engineering Notes.

**BRISTOL.**—Extensive improvements are about to be carried out in the vicinity of the harbour at Bristol, including railway-lines on both sides of the Float and two swing bridges, by which Hotwells and the Ashton Gate district will be connected. Tenders are invited for the combined road and railway swing-bridge, which is to be thrown across the Avon from near Cumberland Basin to Ashton on the south-east side of the river. The bridge will have a carriage road 31ft. wide, with pavements on each side and new approaches from Cumberland-road and Cumberland Basin. From it a new road will be carried across the creek over the riverside portion of Bedminster Park, and will be continued with an easterly curve so as to join Coronation-road, and so connect Hotwells with West Bedminster. Another new road will connect the bridge with Ashton-road. The bridge, which is to be of steel, will be supported on masonry piers with timber extensions, and it will leave an opening of 85ft. when it swings. It will be moved by hydraulic power. There will be upper and lower floors, the public taking the top and the merchandise to and from the docks the bottom. The new approach road from Cumberland-road will cross the Canons' Marsh line by a steel bridge. The second bridge over the Avon will be for foot passengers only, and is now in course of construction. It will cross the river a little above Vauxhall Ferry.

### COMPETITIONS.

**EDINBURGH.**—MIDLOTHIAN COUNTY BUILDINGS. —The Midlothian County Council, who propose to rebuild the County Buildings in Parliament-square, Edinburgh, are inviting architects to submit competitive designs for the new buildings. The published conditions provide that only architects who have been in practice on their own account for not less than two years will be permitted to compete. The council reserve to themselves the ultimate decision as to the selection of an architect from among the competitors. They will, however, appoint "a neutral architect of standing" as assessor, and promise to give the fullest consideration to his advice. If from any cause the buildings are not proceeded with, and no drawings other than the competitive drawings have been prepared, the selected architect will receive a payment of £200 in full of all claims. In respect of the other competitive designs, two premiums will be paid—viz., £100 to the author of the design adjudged to be best by the architectural assessor, and £50 to the author of the design placed second by the architectural assessor. The drawings to be submitted are a plan of each floor, an elevation of each front, and two sections. These are to be to a uniform scale of 8ft. to the inch. In addition to these, competitors may send in drawings showing details of parts and special appliances made to a scale of 2ft. to the inch, and not more than two perspective drawings. Each competitor is to submit with his design a descriptive report and an estimate of the probable cost of the building. The estimates submitted by the competitors will be tested by an ordained surveyor appointed by the council. Any design estimated by him to cost more than £40,000 may be disqualified, and the council will consider the relative cost of the designs as estimated by him in the selection of an architect. Designs distinguished by a motto or device are to be lodged with Mr. A. G. G. Asher, W.S., county clerk, at his office in the County Buildings, Edinburgh, on or before Tuesday the 27th June, 1899, at 5 p.m. It is stipulated that any design will be excluded from the competition (a) if sent in after the hour and date named, (b) if in violation of the conditions, (c) if it do not substantially give the accommodation asked for, or (d) if the author of the design attempt to influence the decision of the council or of the assessor. The architect selected by the council will be employed to carry out the work at the rates of remuneration and under the conditions sanctioned by the Royal Institute of British Architects.

**SALFORD.**—In the competition for three chapels and other buildings at the proposed new cemetery at Agecroft, the town council of Salford have adopted the report of a committee, and have awarded the first premium of £50 to Messrs. Walter R. Sharp and Frederick Foster, of Morson Chambers, 28, Deansgate, Manchester, who have been appointed architects for the work

at the normal commission of 5 per cent. on the outlay, £8,830. The second premium of £30 was awarded to Mr. Henry Lord, John Dalton-street, Manchester, and the third of £20 to Mr. Alfred H. Mills, Temple Chambers, Brazen-nose-street, Manchester. The cemetery will be 45 acres in extent. The Local Government Board having sanctioned the borrowing by the Salford Town Council of the sum of £38,500 for the purchase of the barracks site, the council authorised the committee to advertise for competitive designs for covering the site in question with artisans' dwellings, shops, and a public hall. It was stated that it was intended to erect four, five, and six-roomed houses, the larger ones having baths, to open a recreation ground on the site, to widen Gloucester-street to 12 yards, and to have all new streets at that width, and new passages to be 9ft.

**WIGAN TECHNICAL COLLEGE.**—Out of the eight firms from London, Manchester, Liverpool, Wigan, and Blackburn invited to compete for this technical college, the plans submitted by Messrs. Briggs and Wostenholme, of Blackburn and Liverpool, have been selected, and the first portion of the scheme is to be proceeded with at once, at a cost of about £20,000. The complete scheme is to cost about £30,000. A special feature of the plan is a large lecture-hall to accommodate 700 persons. The structure will be Victorian in style, and is to be faced with pressed bricks and terracotta. The principal entrance is to be in Library-street, the building having frontages to four new streets recently formed in the centre of the town, where a considerable area has been cleared of old buildings to effect town improvements.

#### CHIPS.

Mr. Francis Sharpe, the eldest son of the late Mr. Edmund Sharpe, F.R.I.B.A., the author of "The Seven Periods of Gothic Architecture," died on Monday at Crosslands, Lancaster, aged 53 years.

Broad Oak House, Accrington, is to be rebuilt for Mr. G. M. Macalpine, under the joint direction of Mr. Watson, Bath-street, Glasgow, and Mr. Henry Ross, of Accrington.

The architectural class of the Glasgow School of Art, accompanied by Mr. Lindsay Miller and Mr. H. Campbell, architects, held their annual four days' Easter excursion at Oxford. Under the leadership of Mr. W. J. Anderson and Mr. W. R. Watson, the party made the round of the more important colleges, and, by permission of the Dean, were afforded access to every part of the cathedral buildings and facilities for sketching and measuring.

The death of Mr. James Southcott, formerly the head of the firm of Messrs. Southcott and Co., builders, of Southwood-lane, Highgate, occurred on Saturday at his residence in St. John's-terrace, Hove. Mr. Southcott, who was 77 years of age, was born at South Moulton, Devonshire, and came to London as a young man. About forty years ago he acquired the business of the late Mr. Coxhead, of Highgate, and from that time until his retirement into private life a few years ago was actively engaged in many ways in that suburb. He built many large houses in Hampstead-lane, The Grove, and on Wells Hill, and the Crouch End Board School, Hornsey. On his retirement he was succeeded by his only son, Mr. James Dagon Southcott.

The Ontario Society of Civil Engineers have now a Bill before the Ontario Legislature which is designed to close the ranks of that profession to all but duly-qualified persons. "If this Bill should pass," says our contemporary the *Canadian Architect*, "there will remain no argument for refusing to place the profession of architecture on the same footing."

The town council of Inverness, at their meeting on Monday, accepted the offer of Sir Robert Finlay, M.P., to restore, at his own expense, the old Town Cross, in connection with the Clachnacuddin Stone proposed to be placed at its foot.

On Friday Mr. F. H. Talloch, M.I.C.E., Local Government Board Inspector, held an inquiry in the Bournemouth Council-chamber relative to an application by the town council for sanction to borrow £650 for the provision of machinery for pumping water for use in the public gardens, and £5,000 for technical instruction purposes.

The Local Government Board have sanctioned a loan of £30,229 for eight miles of new tributary sewers at Leicester, being the first of four sections of new sewers to replace old defective ones in the oldest part of the town. The Board have sanctioned the scheme of sewer ventilation by shafts alone, without any grids, as recommended by the borough engineer, Mr. E. George Mawbey, M.I.C.E.

#### PROFESSIONAL AND TRADE SOCIETIES.

**BRISTOL SOCIETY OF ARCHITECTS.**—The monthly meeting of this society was held at the Fine Arts Academy, Clifton, on Monday evening, Mr. W. L. Bernard, F.R.I.B.A., the president, being in the chair. Mr. Edgar Singer, of Frome, read a paper on "Memorial Brasses and Enamels," and the lecture was illustrated by numerous rubbings of fine specimens of German, Flemish, and English brasses; the different varieties of enamels were explained, and specimens of Limoges, cloisonné, &c., exhibited. The voting papers for the election of officers and council for the ensuing session were opened, Mr. W. L. Bernard being again re-elected president. Messrs. Joseph Wood and Frank Willis were elected vice-presidents, and the hon. secretary and treasurer (Mr. H. Dare Bryan) was unanimously re-elected to fill these offices. The members of the council were Messrs. Bond, La Trobe, Oatley, W. S. Paul, Skinner, and J. Foster Wood.

**EDINBURGH ARCHITECTURAL ASSOCIATION.**—A meeting of this Association was held on the 5th inst. in the Royal Institution, Princes-street, Mr. Thomas Ross, president, in the chair. Mr. James Bruce, W.S., referred to the honour recently conferred upon Mr. McGibbon, an ex-president of the Association, by the University of St. Andrews, and moved that they express the sense of their high satisfaction that St. Andrews University had seen fit to confer the degree of LL.D. on Mr. McGibbon. The motion, which was seconded by Mr. Kerr, architect, was cordially agreed to. Mr. Campbell Irons then read a paper on the "Architectural Antiquities of Leith." The origin of Leith was wrapped in mystery. The first reliable mention of the port was in the foundation charter of the Abbey of Holyrood House, granted by David I. in 1128, in which it was stated that the first house built in Leith was erected in the twelfth century. The lecturer proceeded to give descriptions of such old buildings as Leith possessed, or still possesses, and related various anecdotes referring to the owners and occupiers of these.

**EDINBURGH ORDAINED SURVEYORS.**—A meeting of ordained surveyors was held in Dowell's Rooms on Friday night, Mr. P. Lawrence in the chair. The report of the committee appointed at the last general meeting was considered, and a draft constitution of a proposed society of ordained surveyors was submitted. It was stated that the proposed rules had been submitted to and approved by the Lord Provost, Magistrates, and Council, and by the Sheriff of Midlothian and Peebles. On the motion of Mr. R. Keir, seconded by Mr. A. Lawrie, it was resolved to form a society of ordained surveyors on the lines of the proposed rules, and on the motion of Mr. A. K. Smith, seconded by Mr. R. Murray, it was resolved that the first meeting of the society be held on the 20th April, when the rules should be fully approved, and office-bearers elected. The scheme received the unqualified approval and support of all present.

**GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE.**—The students attending the architecture and building construction classes of this college recently visited Motherwell and Hamilton. The party numbered about forty, and Mr. Alexander Cullen, F.R.I.B.A., architect, acted as guide. The Co-operative Buildings, the Victoria Lodging House, now in process of construction, and the recently-opened Technical School in Airbles-street, all designed by Mr. Cullen, were visited. After dinner at the Brandon Hotel, the party walked to the new County Hospital, and afterwards saw a modern mansion, Ross House. At Hamilton Palace the party were shown over the interior. Lastly, three buildings in Hamilton were visited—the old Parish Church, designed by the Brothers Adam; the new Avon-street U.P. Church, by Mr. John B. Wilson, of Glasgow; and the Brandon Chambers, by Mr. Alex. Cullen.

**SANITARY INSPECTORS' ASSOCIATION.**—At a meeting of the association held on Saturday night at Carpenters' Hall, London Wall, E.C., a paper "On the Various Methods up to Date of Sewage Disposal" was read, which had been prepared by Mr. D. Balfour, C.E., of Newcastle-on-Tyne. The varying circumstances of different localities necessitated various methods for treating and disposing of sewage, and the most successful of the modern methods, the newest of which were either chemical or bacteriological, were explained. As a Royal Commission was investigating these

important questions, the lecturer would not offer comparison upon the best known, some of which were successfully working—Dibdin's at Sutton, Colonel Ducat's at Hendon, Mr. Donald Cameron's at Exeter; but the paper concluded with the opinion that as the outcome of the present investigation the objects contemplated by the Rivers Pollution Prevention Acts would soon be fully realised.

#### PARLIAMENTARY NOTES.

**THE ESTIMATES.**—In the House of Commons on Monday, the following votes were passed in Supply: £49,000 for works at Royal palaces and Marlborough House, £119,000 for Royal parks, £36,000 for Houses of Parliament buildings, £54,000 for miscellaneous legal buildings, Great Britain; £30,000 for art and science buildings, Great Britain; £31,000 for Diplomatic and Consular buildings and for the maintenance of certain cemeteries abroad; £348,000 for Customs, Inland Revenue, post office, and post office telegraph buildings in Great Britain, and certain post offices abroad, including furniture, fuel, and sundry miscellaneous services; and £265,000 for sundry public buildings in Great Britain.

#### WATER SUPPLY AND SANITARY MATTERS.

**ALTRINCHAM.**—The district council of Altrincham have accepted the scheme of Messrs. Hinnell and Murphy, C.E., of Manchester and Bolton, for a new outfall-sewer, storm-overflows, and sewage-purification works. The scheme involves an expenditure of £21,000, and provides for sedimentation-tanks and land filtration works for the purification of the sewage of their districts and parts of Bowden and Dunham. The existing system of sewage treatment is by broad irrigation on land, and has been in successful operation for 30 years; but, owing to the large increase of population, it has been necessary to extend the present works as provided for in the scheme mentioned.

A new theatre is being erected in Holloway-road, N., and special consideration is being given to the ventilation, which will be carried out on the Boyle system.

A Local Government Board inquiry was held by Mr. W. O. E. Meade-King, M.I.C.E., at Looe Guildhall on Tuesday, for the purpose of hearing the application of the Looe Urban District Council for sanction to borrow £6,000 for purposes of obtaining a water supply, from plans by Messrs. S. W. Jenkin and J. Thomas.

The executive council of the Glasgow International Exhibition of 1901 decided, on Tuesday, to accept, for the erection of the industrial and machinery sections of the undertaking, the offer of Messrs. Shaw and Son, £68,425 8s. 7d. (being the lowest), for the whole work. This sum was £8,425 in excess of the amount named in the conditions of competition to the architects, and only £10,000 in excess of the actual cost of the similar buildings in the Exhibition of 1888.

In the Chancery Division, on Wednesday, Mr. Justice Stirling gave judgment in the action "Char-nock v. Court and others," a trade-union case arising out of a strike of joiners at Halifax. He found that the defendants, representatives of the union, had broken the law in paying the expenses of men, who had been brought from Ireland to take the place of the strikers, to go to other towns, and granted an injunction restraining them from so acting in the future. But as to the charge of illegal picketing at Halifax, he could not, on the evidence, say that anything beyond what was allowed by law had been done, and on this point the plaintiffs' case failed.

The parish church of Hetton, built in 1831, is now razed to the ground. The work of demolition commenced a month ago under the supervision of Mr. William Sparrow, who is also the contractor for the new building. The new church will be built of stone at a cost of upwards of £4,000. It will comprise a nave, chancel, and morning chapel, with a baptistry at the west-end, and will provide sitting accommodation for 700 worshippers.

At the Westminster Palace Hotel, on Wednesday, a Conference of the Association of Building Societies was held to consider the Small Houses Bill, introduced into the House of Commons by Mr. Chamberlain and the Attorney-General, and which empowers local authorities to advance money to enable persons to acquire the ownership of small houses in which they reside. Mr. Charles Binyon, chairman of the Association, presided, and there was a large attendance of delegates from most of the societies in the kingdom. It was agreed to request Mr. Chamberlain to receive a deputation, and to recommend the various Building and Friendly Societies throughout the country to ask their local members to oppose the second reading of the Bill.

CENTRAL LONDON ASYLUM AT HENDON.—THE NEW WAR OFFICE, WHITEHALL.—PROPOSED CONSTABULARY OFFICES AND COURTS FOR THE BOROUGH OF WARRINGTON.—DERBYSHIRE INFIRMARY CONVALESCENT HOME.—COTTAGES AT PORT SUNLIGHT.

## Our Illustrations.

## THE CENTRAL LONDON SICK ASYLUM AT HENDON.

THIS building, the design for which was selected in a limited competition, is being erected at Hendon, a short distance from the main Edgware-road. Near the entrance gates on the right-hand side is the porter's lodge, and from here the road ascends to the higher ground on which the main buildings stand. These at present give accommodation for about 275 patients, but the whole of the administrative department has been designed, built, and fitted for an extension, if necessary, for nearly double that number. The main corridor with which all the wards and other buildings are connected, runs east and west. In the main central front of this, on the south side, is the official block, and behind this, on the north side, is placed the administrative. On either side of this block corridors lead north to the laundry, boilers, and workshops; beyond these, detached from the main buildings, being the mortuary, &c. On either side of the administrative, on the north side of the main corridor, are two two-story pavilions, and a store for patients' clothes. To the west of the administrative, and on the south side of the main corridor, is the nurses' home, a very important feature in the design, being attached to the main buildings by means of a covered way although distinct from it. This building contains rooms for nurses, probationers, matron, servants, &c., and forms a complete establishment for the female staff of the institution. To the east of this block are two one-story blocks for infectious cases and the receiving ward, and again on the other side of the official block is another receiving-ward, the operation block, and a large one-story block for children, and beyond this, but further south, is the doctor's house, detached from the main buildings. The steward's house has been placed at the back, commanding the stores department. The buildings are faced with red brick, relieved with white Suffolk brick bands, and Portland stone dressings, the roofs being covered with green slates. The main corridors are lined to a height of 4ft. 6in. with glazed brick with moulded capping, with Keene's cement above. Messrs. J. and H. Patteson's mosaic pavement is used for the floors, and the stairs and landings are all of granolithic and fireproof. The wards are finished in plaster, with a dado of Keene's cement, all angles being rounded. The floors are of fireproof construction, and finished with pitch-pine polished, and the whole of the joiners' work throughout is of pitch-pine varnished. In the administrative block, laundry block, &c., the floors are of granolithic, and in some cases wood block; and the rooms in mortuary, laundry, kitchens, &c., are lined to dado height with glazed brick. The

ventilation of the wards is on the latest and most approved lines, and the atmosphere of any ward can be changed and purified in a few minutes. The heating of the buildings is by hot water on the low-pressure system with radiators, the wards also having ventilating stoves. The buildings are to be lighted by electricity. Bed-lifts for patients are provided to all floors, and also lifts for coal service and other purposes. The main contract for the buildings is being carried out by Messrs. H. Willcock and Co., Darlington-street, Wolverhampton, from the designs and under the superintendence of the architects, Messrs. Giles, Gough, and Trollope, 28, Craven-street, Charing Cross, W.C., Mr. W. J. Creed being the superintending clerk of the works.

## THE NEW WAR OFFICE.

THE accompanying double-page plate furnishes a larger scale elevation of Mr. William Young's design now before Parliament for the New War Office in Whitehall. Last week we gave a general elevation to a smaller scale, showing how the façade will group with the Banqueting Hall by Inigo Jones. The plan and perspective view appeared in our pages for March 31. We shall publish other geometrical drawings of this great undertaking, and also some further illustrations of Mr. Brydon's buildings, to be built in Great George-street, extending from Parliament-street to the Park.

## CONSTABULARY OFFICES AND POLICE COURTS, WARRINGTON: SELECTED DESIGN.

THE design here illustrated was selected in open competition, the assessor being Mr. R. J. Bennett, F.R.I.B.A., of Manchester. The site is open on three sides, and is at present occupied by buildings formerly used as barracks, the armory having been converted into a technical school. The competitors were desired to retain this latter building if it would not interfere with a satisfactory arrangement of the new buildings. The author of this design, however, considered it absolutely essential that the site should be entirely cleared, and the plans will show how the ground is to be utilised. The accommodation comprises police-station with 20 cells, quarters for 13 resident constables, houses for inspector and sergeant, detective department and watch-committee room, police-court, coroner's court, and magistrate's, solicitors', witnesses' rooms, &c. It will be seen that the plan is largely influenced by the position of the cells, which occupy so much of the site. They are in a central position, and entirely inclosed from outside view, and are well arranged for access from the police-station entrance, through the charge-room, which affords perfect supervision over them. The police-court is immediately over the cells, so that direct communication is obtained between the latter and prisoners' dock. The parade-room affords means of communication between the cells and sergeant's house for the supply of food to prisoners under cover, and the single constables' quarters are also accessible from parade-room. The coroner's court is placed to the front overlooking Wilson Patten-street, and the public staircase is midway between the two courts. The benches of the two courts, together with the magistrates' coroners', and magistrate's clerks' rooms are all on the same level, being about 3ft. above the general level of first floor, and are reached from the principal entrance in Wilson Patten-street, as well as from the public corridor. The magistrates' staircase affords a speedy and direct means of communication between the coroner's court and mortuary. The cells and single constables' quarters are arranged with a view to future extension without interfering in any way with the working of the building generally. It is to be a brick building with terracotta dressings, the estimated cost being about £17,000. It is intended to make a commencement in the beginning of May. The architect is Mr. R. Burns Dick, of Northumberland-street, Newcastle-on-Tyne.

## HOLBROOK CONVALESCENT HOME.

THIS building, pleasantly situated on the top of the Derbyshire hills, with a south aspect, is built in local rock-faced stone with drafted angles and with slate roofs. Accommodation is provided for 14 men and 14 women, with dining-room, kitchen, washhouse, and matron's apartments. The buildings and about two acres of land are given by Mr. G. H. Strutt, in memory of his wife. The home is being erected by Messrs. Ford and Co., of Derby, from plans prepared by the

architects, Messrs. Hunter and Woodhouse, Belper, at a cost of over £5,000.

## A GROUP OF THREE COTTAGES FOR WORKMEN, PORT SUNLIGHT.

THESE cottage plans are self-explanatory, and the group forms part of the model village which Messrs. Lever Bros., Limited, are building in Cheshire, adjoining their great works, for their employees. We have already given several drawings since last January of a variety of these dwellings, which are very diverse in picturesque arrangement. This is the first block of three which we have shown. The upper part in the centre is in oak half-timbered framing and rough-cast. Local stone is sparingly used, and thin shaped Ruabon red bricks are employed for the walling; and tiles from the same makers, Messrs. Edwards and Co., are used for the roof and tile-hanging. Mr. Maurice B. Adams, F.R.I.B.A., is the architect of the cottages illustrated.

## CHIPS.

We regret to hear that Professor Henry Adams, M.Inst.C.E., M.S.A., has sustained a heavy bereavement by the death of his wife. Mrs. Adams, who was in her 48th year, died on Friday at their residence, The Cedars, Brockley Hill Park, Forest Hill.

A new Bible Christian chapel is being erected on the Swallowfield Estate, Wellington, Somerset, at a cost of about £2,200. The building, when completed, will seat 350 persons. Mr. F. W. Roberts, of Taunton, prepared the plans, and the chapel is being erected by Mr. Follett, of Wellington.

At Cromer a proposal to extend the gasworks by acquiring adjoining ground has been so strongly opposed by neighbouring landowners that the directors of the gas company have decided to remove the works to a site to the west of the town, adjoining the Midland and Great Northern Railway. Under the agreement with the landowners the company will have a site of over four acres in exchange for its site of three-quarters of an acre, and will be paid a sum of £2,000 towards the cost of removal. The contract for the construction of the new works, in accordance with plans and specifications prepared by the company's engineer, Mr. Percy Griffith, Assoc.M.Inst.C.E., has just been let to Messrs. R. Dempster and Sons, Limited, of Elland, and is to be completed by the end of the present year.

The east window of Kirkstall Church, Leeds, has been filled with stained glass in three lights, representing two Saints in Glory, St. Stephen and St. Paul, and a reredos has also been erected on which are figures of the Twelve Apostles. The sanctuary has at the same time been decorated with a fresco representing the death of St. Stephen. The whole of the work has been designed by Mr. G. Ostrehan, of Sunbury-on-Thames.

Stained glass has been inserted into the east window of Holy Trinity Church, Batley Carr. The window is designed to portray the three Persons of the Trinity. Archangels and angels, bearing shields inscribed with the emblems of the Passion, fill up the chief forms in the tracery of the window. Messrs. Powell Brothers, of Park-square, Leeds, are the artists.

The Norwich Board of Guardians have referred to a committee the consideration of the desirability of providing more adequate accommodation in the workhouse infirmary. It is suggested that the building should be reconstructed at an estimated cost of £25,000.

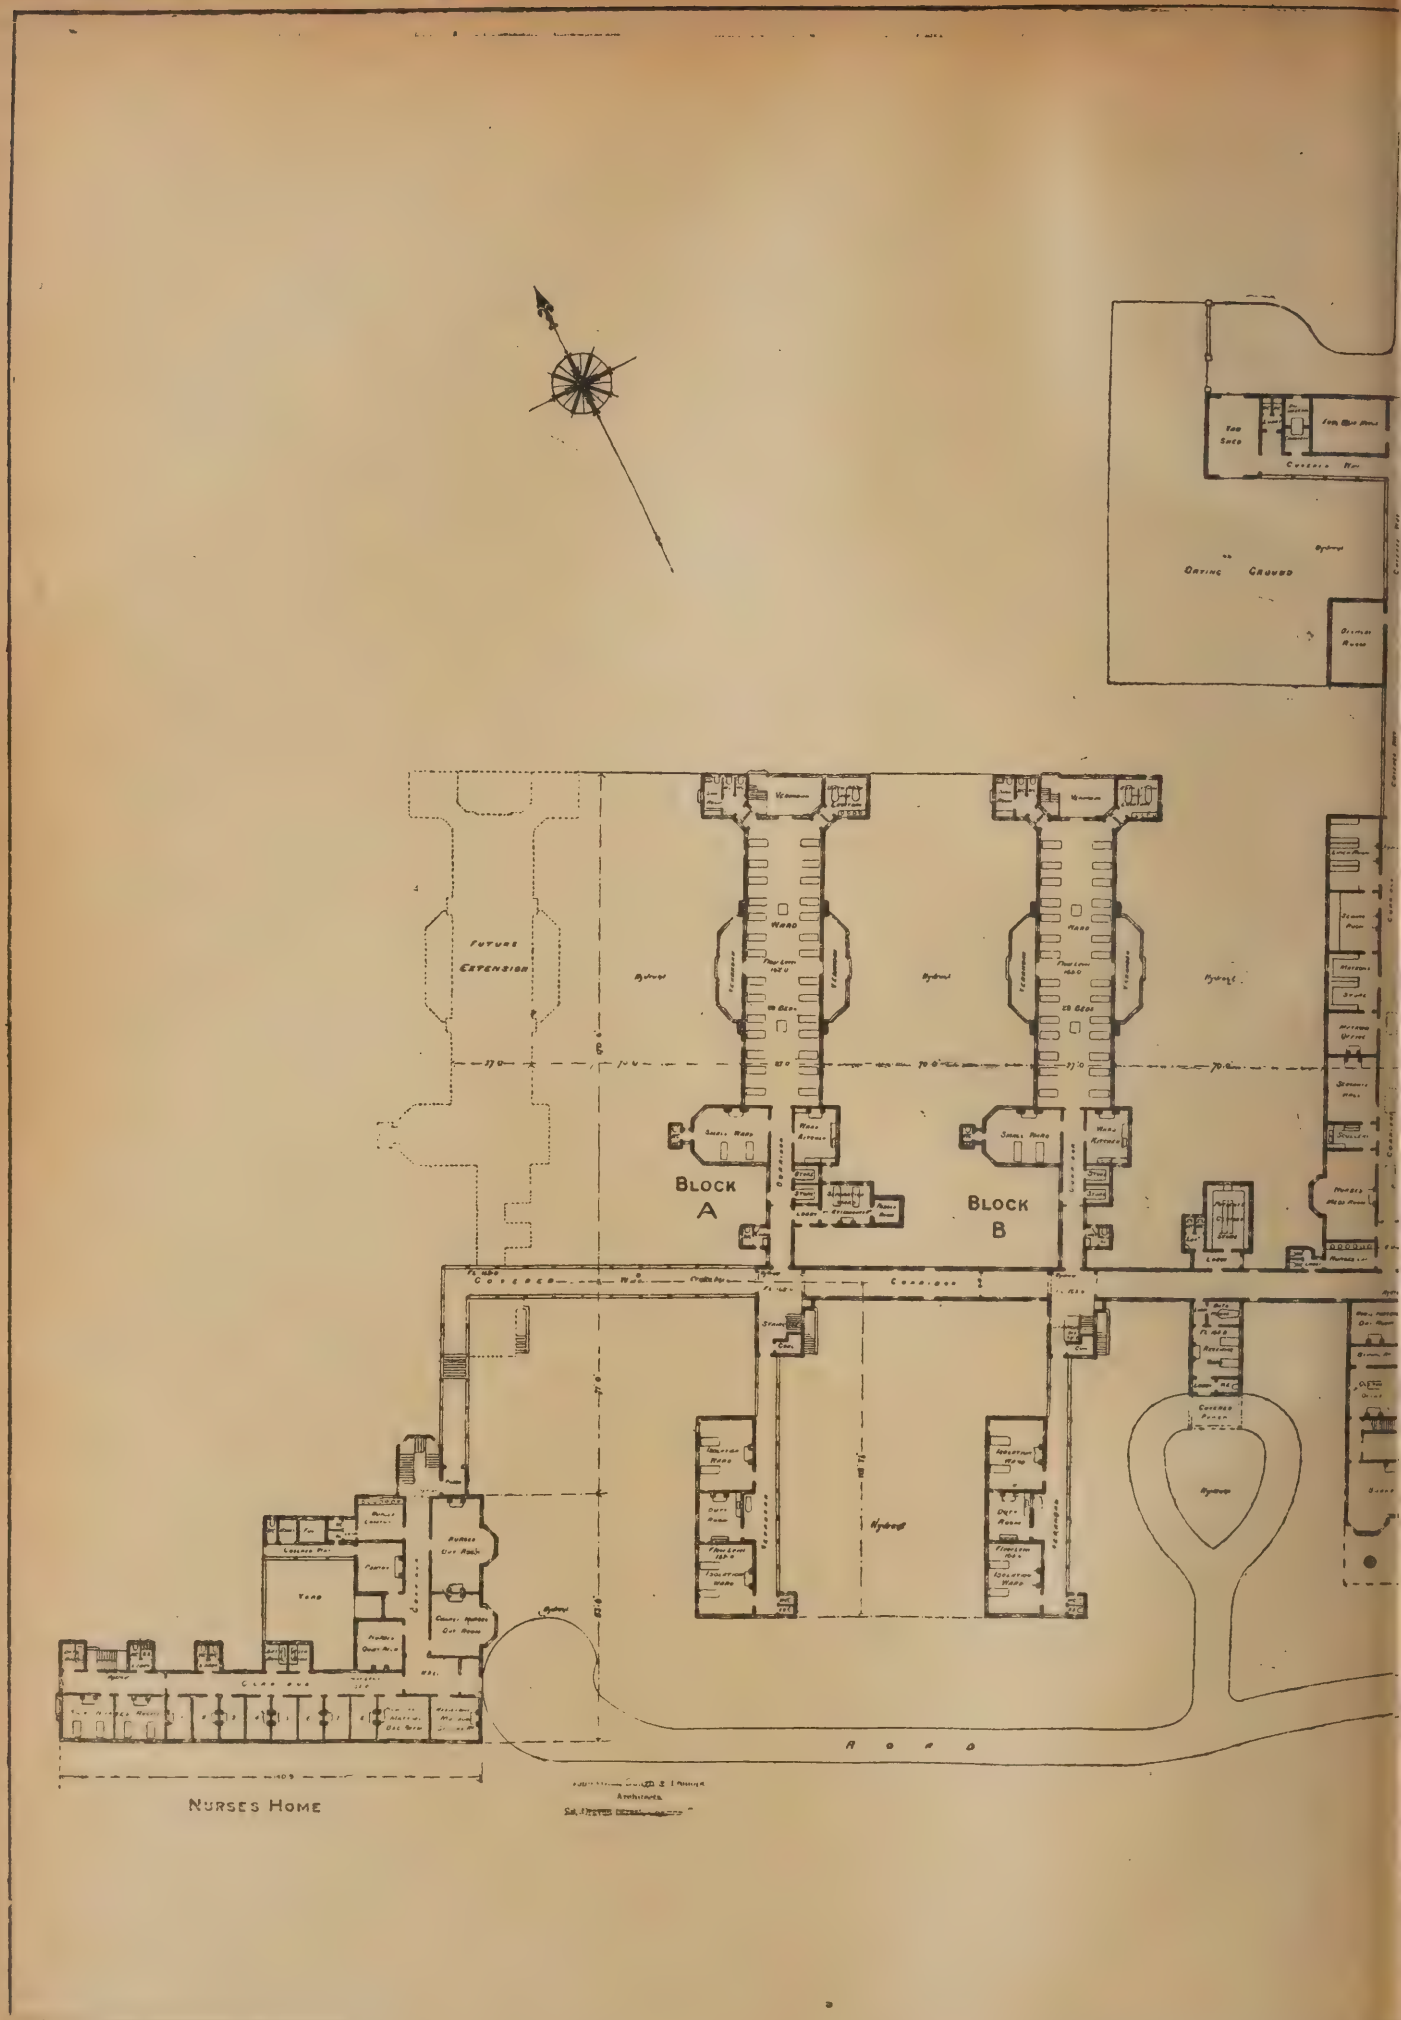

Mr. Coningsby Disraeli, M.P., is having Hughenden Manor considerably enlarged by the addition of a new wing, which will involve an expenditure of about £7,000. The Manor, which was erected by the Dormers, and extended by the elder John Norris about a century ago, is Tudor in style.

At Kew Gardens, on Good Friday, a new wing which has been added to the Temperance House was thrown open to the public. The wing completes the building. The architects, Messrs. Mackenzie and Moncur, of Edinburgh, have followed the plans of the original building, but alterations have been made in the internal structure, and the ventilation is carried out on improved principles.

The rural district councils of Chester-le-Street and Houghton-le-Spring have adopted plans by Messrs. D. Balfour and Sons, of Newcastle, for a steel overhead footbridge of 150ft. span, to be thrown across the River Wear from Coxgreen to Washington Staiths.

Mr. C. D. Taite, the electrical engineer to the Southport Corporation, has estimated that £55,000 will be required for the necessary extensions to the electricity estate during the next two years. The principal items in this outlay are rendered necessary by the provision of electric tramway plant and buildings.

HENDON ASYLUM.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 832, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## NOTICE.

Bound copies of Vol. LXXV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXI., XXXII., XXXIII., XXXIV., XXXIX., XL., XLIV., XLVI., XLIX., LI., LIII., LIV., LV., LIX., LX., LXI., LXII., LXIV., LXV., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., and LXXV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 8dols. 90c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 90c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

RECEIVED.—W. L.—H. F.—C. G. and Co.—N. B. C.—O. L. (Liverpool).—M.—L. N. G.

"BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Dodo," "Quadrant."

## Correspondence.

## THE NEXT PRESIDENT OF THE INSTITUTE.

To the Editor of the BUILDING NEWS.

SIR,—Can your readers be so sure that your correspondent, Mr. William Woodward, is justified in his conclusions? It would be an advantage to give the members a chance of voting for their president. The Council contrive everything, leaving only the payment of subscriptions to the general body. Let us have three names and no canvass, allowing each candidate to stand on his own reputation. At present everything is cut and dried beforehand, with the result that nobody takes the slightest interest in what is done, outside the members who always attend, and always make a point of speaking, no matter what the subject. Mr. William Emerson has been hon. sec. for a long time, but he is almost entirely unknown to the profession. Mr. Henry Louis Florence worked for years in the Architectural Association, served as President just 20 years ago, and 30 years ago he took the Soane Medallion with a fine set of drawings, and he since figured in the ranks of the Volunteers among the Artists. He is therefore more likely to be popular. These surely are but minor considerations, and if the Institute is to emerge from the shadow which some of us feel so keenly, we must have a man at the head of affairs whose works leave no doubt whatever that the R.I.B.A. is presided over by an architect of unqualified reputation and ability. I remember the shame

which I for one among many shared when Sir Horace Jones, the chosen of the then Council, was elected in opposition to George Edmund Street. I do not compare either of the present candidates with the late City Architect, of course; but if there is a man more qualified than anyone to take the office, with a view to the prosperity of the Royal Institute of British Architects, it surely is Mr. Aston Webb, A.R.A., who has vast undertakings in hand of architectural consequence. He is a business man, and knows the profession thoroughly. I only hope he will allow himself to be nominated.—I am, &c.,

A FRIEND OF ALL THREE.

SIR,—I am not surprised to see the letter printed in the BUILDING NEWS of April 7 on this subject, as I happen to have been informed of the wire-pulling which has been going on, and also to know something of the lithographed letters which have been recently circulated among the Conduit-street cosy coterie reputed to be managing matters under Royal patronage, nominally for the architectural profession, more particularly in the interest of the Institute Council. What puzzles me, however, is the question which people are asking as to why Mr. William Woodward should thus busy himself in advocating Mr. Florence's claims to the presidential chair. Not that I have the least objection to our esteemed vice-chairman, for whose personality I yield to none in admiration; indeed, in this respect, Mr. Florence would undoubtedly fittingly follow Professor Aitchison, whose *couleur de rose* no one ever ventured to question. Money is much, gentlemanly bearing is more, but practical business-like conduct surpasses both of these qualities. Why should we shirk a contested election, and why should the Council always have its own way? Surely the introduction of a little spirit among the rank and file would tend to impart a more real interest in what is going on, serving to broaden the narrow limits which too long have dominated the mutual admiration of the Dinner Club, near Hanover-square. The object of this note, however, is not to attempt any undeserved disparagement or excite any invidious comparisons; but, in my humble opinion, Vice-President Grüning has a prior claim upon our suffrages, and, more than that, I believe he has many supporters who consider his claims far higher than those of either Mr. Wm. Emerson or Mr. Florence.—I am, &c.,

AN OLD LONDON CITY MEMBER.

SIR,—I do not agree with Mr. Woodward, whose letter in your issue of last Friday I have just seen. It seems a pity thus to thrust the private affairs of the Royal Institute of British Architects before outsiders, and by intruding in this manner your correspondent only renders the task of thwarting foregone conclusions all the more difficult. By rendering the position impossible for a candidate of eminence and disinterested character, Mr. Woodward injures the cause which he professes to aim at furthering.—I am, &c.,

F.R.I.B.A.

SIR,—Why have any architect as president? Years ago we fell back on a layman—Mr. Beresford Hope, while Earl de Grey was the first occupant of the chair. Why not elect Lord Grimthorpe or Mr. Harry Hems? If neither of them will serve, let us have a penny-in-the-slot machine.—I am, &c.,

THE YOUNG OBADIAH.

## ARCHITECTS AND LOCAL AUTHORITIES.

SIR,—In your last issue but one, giving the account of the discussion on "The Experience of Architects in their Relation to Local Authorities," at the Society of Architects, it would appear from your report of Mr. Ellis Marsland's remarks, that persons wishing to build outside the Metropolitan area must necessarily await the sanction of the local authority before commencing. I do not think this is so. Sec. 158 Public Health Act, 1875, imposes a duty on local authorities to approve or disapprove of plans, &c., within a month, but does not appear to require the person to delay operations till that time, any more than in the Metropolis, and, indeed, the latter part of first paragraph of the section anticipates commencement before sanction, provided the by-laws are complied with, and I believe this point has already been settled in the courts. That being so, there should not be the misapprehension among architects that appears now to exist.—I am, &c.,

A. H. WORSLEY.

## Intercommunication.

## QUESTIONS.

[12224.]—Cape Colony.—Information is requested regarding the names and uses of the principal timbers in use for building purposes in Cape Colony. Also the uses and description of the various building materials. Kindly mention any guide-books or other sources from which further information may be obtained, and oblige.—D. S. M.

[12225.]—Sunshine Calculator.—I understand there is a movable calendar to be had, by which one can calculate the amount of sunshine (in hours) the various elevations of a building should receive during the several months of the year. I should be obliged, if any reader knows of such a thing, if he will inform me.—T. R. P.

[12226.]—Removing Paint.—What will be the best way of getting paint off about 900 square yards of church seats? They are going to be stained, so it will not do to burn them off.—NOVICE.

[12227.]—French Concrete Piles.—Where can I get a book, or any information, on the French system of concrete piles, or will some reader of the BUILDING NEWS give details?—H. DOWLING.

## LEGAL INTELLIGENCE.

A PORTSMOUTH ARBITRATION.—Sir John Whitaker Ellis, who was appointed to act as arbitrator in a dispute between the Portsmouth Corporation and the owner of some land at Southsea, has given his award. On the municipal body taking over from a burial board a cemetery at Southsea, an agreement by the latter body to purchase land for the enlargement of the cemetery was repudiated by the corporation on the ground that the consent of the Home Secretary had not been obtained. Mr. Justice Byrne held that the contract was invalid, but this decision was reversed by the Court of Appeal. The price to have been paid for the land was £6,170, and the arbitrator has awarded the vendor £2,970 as damages for breach of contract, together with interest and costs.

IN RE G. FORESTER, OF CHESTER.—At the Law Association-rooms, Cook-street, Liverpool, on the 7th inst., a meeting was held of the creditors of Mr. George Forester, builder and contractor, of Boughton, Chester. The statement of assets showed total liabilities of £3,603, of which £1,728 was owing to trade creditors, and £1,875 to relatives and others, being cash advanced. The total assets were estimated at £1,085, leaving a deficiency of £2,520. There were several uncompleted contracts, including one for the building of a post-office at Douglas for the Government. The debtor was questioned as to how he accounted for so large a deficiency in eighteen months or two years' trading. He stated that it was due to pressure of creditors, and also to the fact that his stock, &c., which, when he purchased the business, was valued at £1,200 was now put down at only £500, though there had been no diminution. It was decided to wind up the estate in bankruptcy.

RE J. L. P. SANDERSON.—A first meeting of creditors was held on Saturday, before Mr. C. A. Pope, Assistant Receiver. The debtor was described as of Marble Arch Mansions, Oxford-street, brick manufacturer, carrying on business at the Ashstead Brickworks, and formerly as a tea dealer, under the style of J. Sanderson and Co. A statement of affairs was lodged, showing total liabilities £32,500, of which £19,190 are unsecured, and assets estimated at £2,293. No proposal was submitted on the debtor's behalf. An order of adjudication had already been made, and the matter was left in the hands of the Official Receiver as trustee.

WORKMEN'S COMPENSATION ACT.—At the Southwark County-court, on Tuesday, before Judge Addison, Q.C., William Robert Brown, a bricklayer's labourer, sued Mr. H. W. Brown, a builder and contractor, of Albert-road, Dalston, to recover £200, under the Workmen's Compensation Act, for injuries sustained. Plaintiff's counsel said that on Nov. 15 last his client, who was at work for the defendant, was ordered by a foreman to place a board in front of a steam exhaust pipe. After he had done so plaintiff was about to descend from the roof when he became enveloped in steam, with the result that he stepped through an unguarded skylight. He fell a distance of 24ft., and injured both legs in such a manner that one would probably have to be amputated. It was contended that the accident happened as the result of a negligent order by the foreman. His Honour gave judgment for the plaintiff for £100 and costs.

BRADFORD CORPORATION ARBITRATION.—Mr. B. Jackson, C.E., of Halifax, sat as umpire at Bradford on Monday, along with Mr. Charles Gott, C.E., as arbitrator for the Bradford Corporation, and Mr. Sam Jackson, C.E., for Mrs. Lofthouse, in arbitration proceedings regarding the value of some cottage property situate at the junction of Olley-road and Tennyson-place, required by the Bradford Corporation for street improvements. Mr. J. J. Wright appeared for the claimant, and Mr. W. Waugh for the corporation. Mr. Wright's valuation was £1,360; Mr. Waugh's was £376.

## Our Office Table.

THE correspondence which has recently appeared in the daily journals with reference to the decoration of St. Paul's has resulted in the forwarding of a temperately worded protest to the Dean and Chapter. The memorial, which is signed by Earls Stanhope, Egerton, and Windsor, Lords Leconfield and Newton, Sir E. J. Poynter, Mr. Samuel Howe, and Mr. F. Cavendish Bentinck, M.P. (significantly enough, no architect's name appears in the list), reads as follows: "The decorations now proceeding under the dome of St. Paul's Cathedral having given rise to much criticism, we trust that the following appeal will meet with your favourable consideration. Although the members of the Royal Academy, the members of the Royal Institute of British Architects, and other recognised authorities have hitherto remained silent, there are strong grounds for believing that they, in common with many others, fear that—in the words of the late Dean Milman—'the solemnity and the harmonious simplicity of the edifice' may be disturbed under the present scheme. While recognising a general desire to enrich the interior of the building, we would venture to submit to the Dean and Chapter that the opinion of experts appointed by the above-named bodies should be taken as to whether the stencilling in red paint of the principal mouldings and cornices under the dome and the black lettering on the frieze are a form of decoration likely to impair the chief architectural features of the structure as originally conceived and carried out by Sir Christopher Wren."

DEAN GREGORY has promptly replied to the memorialists, stating that their appeal shall have the fullest consideration. "It is," he adds, "satisfactory to find that such distinguished and wealthy men take an interest in St. Paul's—an interest, however, which none of them evinced when we have been collecting funds for raising St. Paul's from the discreditable condition in which it was allowed to remain for a long period of years, and which was a disgrace to the Metropolis."

THE Liverpool Corporation have turned a deaf ear to the plans received by the Bishop of Liverpool, the Historic Society of Lancashire and Cheshire, and others, that the picturesque tower and spire of St. George's Church and building now in course of demolition should be retained, and by 43 votes to 25 rejected the motion of Councillor W. E. Willink, A.R.I.B.A., the President of the Liverpool Architectural Society, to refer the matter back to the committee. The fate of the tower, an unusually good example of work for 1820, was sealed on the ground that the space it occupies is required for widening the thoroughfare on which it stands, and which is now only 4ft. in width.

THE annual report of Sir Edward J. Poynter, P.R.A., in his capacity as director of the National Gallery and the Tate Gallery, furnishes information concerning the five pictures purchased during last year, and eighteen paintings received as bequests and donations, in addition to five that were handed over by the Council of the Royal Academy under the terms of the Chantrey bequest. The purchases consist of three specimens of the skill of Ambrogio de Predis, Hogarth's portrait of Mrs. Salter, and a painting by J. B. Simeon Chardin; whilst among the gifts and bequests are Mr. G. F. Watts's portrait of himself; the portrait of Mr. Gladstone, painted by the late Sir John Millais, and presented to the nation by Sir Charles Tennant, and another work by the same artist, "The Order of Release," given by Sir Henry Tate. Three bronzes were presented during the year, one being a bust of Sir Henry Tate, by Mr. Thomas Brock, presented by a body of subscribers, and fittingly placed in the gallery for which the nation is indebted to Sir Henry's munificence.

THE Dartford Rural District Council believe that the stringency of their building regulations hampers builders in the erection of cottages in many villages where there is an urgent need for more accommodation for families of the labouring classes. It was stated that, under the local by-laws and the pressure of ever-increasing rates, cottages could not be built in their district to let at less than 7s. a week, which was more than

farm-labourers could afford, the inevitable result being that much overcrowding existed. It was agreed by the council at their last meeting to apply to the Local Government Board for permission to rescind the by-laws, in order that a local builder may erect some detached wooden dwellings in the village of Eynesford, it being stated that these were expected to cost £150 a piece, and would be let at 3s. 6d. per week, while the insurance companies only made an extra charge in premiums of 2s. 6d. per cent. for wooden as against brick buildings. It was also unanimously resolved to ask permission to waive the necessity for carrying party-walls of cottages above the roof level.

THE Vicar of Stratford-on-Avon appeals for another £1,000 to defray the balance due on the restoration of the historic church of Holy Trinity, which is now open in its renovated condition. The work done has, he explains, included the entire remodelling of the organ, at a cost of £840; the introduction of new heating apparatus, and the relaying of the floor after filling in the old vaults, at a cost of £1,600; and the substitution for the old and uncomfortable pews of carved oak benches in the aisles and chairs in the nave, at a cost of £576. Including architect's charges and sundry smaller improvements, the total outlay has been £3,450, and the subscriptions received have only amounted to £1,831. The work has been carried out under the superintendence of Mr. G. F. Bodley, A.R.A.

MR. EDMUND S. TAYLOR writes from 19, Old-street, E.C., asking if nothing can be done to save that most interesting relic of the past, the Roman villa at Darenth, from being wantonly destroyed. "I am," he says, "continually receiving letters from those who have recently visited the villa, describing the vandalism which is now taking place there. The stream of visitors having slackened last year, I understood the ruins were to be covered in again, and the land once more devoted to agriculture. Although sad to think that in this enlightened country there should be no society or department of the State willing to step in and prevent this from taking place, still such action, at any rate, would, to a certain extent, have preserved the ruins for the delight and instruction of another generation who might care to bring them to light again. But instead of having been covered in, they are left unattended and at the mercy of anyone who likes to kick to pieces all that was so carefully and reverentially unearthed but a few years since."

IN an article on the finishing of yellow pine, the *U.S. National Builder* deprecates the use of linseed-oil as a filler, as it causes the wood to grow darker continually, and suggests that if it is desired to retain the natural colour of pine, the wood should be first given a coat of white shellac, sandpapered lightly when dry with fine sandpaper, followed by two or three coats of the desired varnish or finish, allowing each coat ample time to dry before applying another. The first coats should be rubbed slightly with hair-cloth or curled hair—just enough to destroy the high gloss—and the last coat may either be flowed on, and allowed to remain as a bright varnish finish, or rubbed, as may be desired. If a smooth, dead finish is wanted, rub the last coat, when hard, with pulverised pumicestone and water, using for rubbing a piece of thick felt made for the purpose. For an egg-shell gloss, rub the last coat, when hard, with pulverised pumicestone and oil. For a polish, rub the last coat first with pulverised pumicestone and water, and then with pulverised rottenstone and water, and a still higher finish can be obtained by giving a further rubbing with furniture polish, used with a little pulverised rottenstone, applied with a piece of soft felt or flannel. Pine, being a close-grained wood, does not need any filling; but it should always receive a first coat of shellac, as above directed.

ONE of the most interesting features at the approaching Building Exhibition will be the *Quarry* collection of building stones and bricks. At least, a thousand specimens of building stone will be gathered together, and as such well-known firms as the Bath Stone Firms, Ltd., Messrs. John Freeman, Sons, and Co., Ltd., of Penryn, and others are contributing largely, there can be no doubt of the value of the exhibit to the architect and builder. We hope the collection may find a permanent home somewhere after the close of the exhibition.

## MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Perth Architectural Association. Visit to Free Middle Church, Tay Street.  
MONDAY.—Society of Arts. "Leather Manufacture," Cantor Lecture No. 1, by Prof. Henry R. Procter, F.I.C. 8 p.m.  
TUESDAY.—Society of Arts. "Inlaying," by Stephen Webb. 8 p.m.  
Institution of Civil Engineers. "Buenos Aires Harbour Works," by James Murray Dobson, M.Inst.C.E. 8 p.m.  
WEDNESDAY.—Society of Arts. "London's Water Supply," by Walter Hunter, M.Inst.C.E. 8 p.m.  
THURSDAY.—Institution of Civil Engineers. "Magnetism," by Prof. J. A. Ewing, M.A., B.Sc., F.R.S. 8 p.m.  
FRIDAY.—Royal Institution. "Earth Currents and Electric Traction," by Prof. A. W. Rücker, F.R.S. 9 p.m.  
Glasgow Architectural Craftsmen's Society. Annual Business Meeting. 8 p.m.

## Trade News.

### WAGES MOVEMENTS.

THE PLASTERERS' DISPUTE.—Since the abortive conference between the master builders and operative plasterers, held last Thursday, when the negotiations were broken off on account of the withdrawal by the men of the assurance previously given on the question of coercion, there has been no change in the situation, and the lock-out continues. The master plasterers decided at a meeting held at Bradford to form a national association of their own, independently of the master builders, and Mr. J. W. Sugden, of Bradford, was elected the first president.

ARBRATH.—A mass meeting of the joiners on strike at Arbroath was held on Monday, when it was intimated that the masters had agreed to grant the advance of wages asked for by the men—from 7½d. to 8d. per hour—but had declined to sign the by-laws which had been in operation last year. The men agreed unanimously to remain on strike until the by-laws are signed by the masters.

EDINBURGH.—A large meeting of the joiners' section of the Edinburgh Builders' Association was held on Monday in the Building Trades' Exchange, Shandwick-place, to consider the demand of the operatives for an increase of ½d. per hour on their wages, and several alterations of the working by-laws. The meeting unanimously felt that the demand for a rise of wages was uncalled for, and that the state of trade did not warrant an advance; but that, in order to avoid friction between employers and the workmen, it agreed to refer the matter to arbitration on condition that the men continue at work until the arbiter gives his decision.

LEICESTER.—The demand of the bricklayers' labourers for an increase of wages from 6d. to 6½d. per hour having been refused, 750 of them have struck work, and to these must be added 60 navvies and general labourers. The stoppage of these men has brought out the bricklayers also, so that 1,500 men are now idle.

OLDHAM.—A largely attended meeting of the Oldham members of the National Amalgamated Society of Operative House Painters and Decorators was held on Tuesday night in the Unity Hall, the business for consideration being an offer by the masters to concede an advance of ½d. an hour, from 8d. to 8½d., from 1st July next. In the course of the afternoon, however, the masters had held a further meeting, and made an amended offer to concede the advance immediately, shop to be reopened next morning. The painters, who have been on strike, to the number of over 200, since April 1, unanimously agreed to accept the amended offer, satisfaction being expressed at the result.

PERTH.—The Perth glaziers came out on strike on Monday for an increase of wages. The men demand an increase of ½d. per hour on the present rate of wages, the current rate being 6½d.

WIGAN.—Mr. Alfred A. Hudson, barrister-at-law, has been appointed umpire by the Board of Trade to settle the disputes between the Carpenters' and Joiners' and the Slaters' and Tilers' Societies, and the Wigan Master Builders' Association.

Mr. Fred. J. Wood, county surveyor of East Sussex, has been appointed to the office of surveyor to the Committee of Visitors to the Hayward's Heath Asylum. He is also acting as surveyor to the committee appointed for the purpose of erecting a new asylum at Hellingly, Sussex.

The Fulham Vestry have under consideration a report by a committee recommending that the salaries of various officials be increased, including that of Mr. C. Botterill, the surveyor, where it is proposed to raise the amount from £325 to £400, rising to a maximum of £550.

## LIST OF COMPETITIONS OPEN.

Fleetwood—Board Schools, West-street (600 places) .....	10gs. (merged) .....	J. H. Kean, Clerk to Board, Fleetwood .....	April 18
Arbroath—Infectious Diseases Hospital (35 beds) .....	£20, £15, £10 .....	W. K. Macdonald, Clerk, Arbroath, Forfarshire .....	" 24

## CHIPS.

A large clock has been erected in the parish church of Loughford, near Stafford, which chimes the quarters, strikes the hours, and has two dials facing west and south. It is fitted with all modern improvements, and is guaranteed to keep accurate time. Messrs. John Smith and Sons, Midland Clock Works, Derby, have carried out the work. The same firm are making a large chiming clock for Swansea parish church.

The Queen has intimated her intention of erecting a lych-gate at Dovercourt parish churchyard to the memory of the many gallant soldiers of her country buried there at the beginning of this century, and immediately following the Walcheren Expedition. It will be remembered that the German Emperor recently offered to fill one of the windows with stained-glass in memory of members of the German Legion buried in the churchyard.

At the vestry meeting for St. Mary's, Truro (a parochial church, now the south aisle of Mr. J. L. Pearson's cathedral), it was announced that an iron screen had been placed between the cathedral aisle and the parish church at a cost of £140, and an anonymous offer of £100 towards a reredos for the parish church according to a design by Mr. Frank L. Pearson, estimated to cost £300 in execution, was accepted.

The Church of the Virgin Mary, Elvetham, has been fitted with the latest improved small-tube hot-water heating apparatus and tubular exhaust ventilators by John King, Limited, engineers, Liverpool, employing their well-known special economical coil-heater.

The annual report of the medical officer of health for Ipswich states that the growth of the town continues to make satisfactory progress, and more than keeps pace with the increase in the population. The number of new dwellings added to the town during 1898 amounts to 360, against 321 built in the previous year. The bulk of the new houses erected are of the small villa or cottage type, but Dr. Elliston reports that there is a great dearth of residences from £45 to £75, owing to which many private families intending to settle in the town are prevented from coming.

The Lord Mayor of Leeds opened, on Friday, a sale of work in St. George's Schools, Clarendon-road, in aid of the fund for the restoration of the church of that parish. The scheme will involve an expenditure of nearly £6,000, towards which £3,700 is in hand.

Plymouth Corporation has rejected, by 40 votes to 11, the recommendation of the water committee to award Mr. Sandeman, the water engineer, an honorarium of seven hundred guineas in recognition of his services at Burrator. Mr. Sandeman was elected six years ago at a salary of £250 per annum, to rise by yearly instalments of £25 until £350 was attained. His salary is now £400, and he has already received grants of 300 guineas and 100 guineas respectively; but the committee had promised a further grant on the completion of the Burrator reservoir, which has been constructed by corporation workmen without a contractor, at a cost of £183,000.

The admirers of the late Rev. Dr. Moulton, of the Leys School, Cambridge, having furnished the requisite funds, Mr. Adams Acton has been intrusted with a commission for a marble bust of the late Head Master and ex-President of the Conference, to be placed in Wesley's Chapel, City-road, E.C. The memorial is to be unveiled by Sir Henry Fowler at the reopening of the chapel on the second Tuesday in June.

The English church built by the Colonial and Continental Church Society, at Lucerne, to commemorate the Queen's Diamond Jubilee, is completed, and will be consecrated by the Bishop of London to-day (Friday).

Architects, surveyors, and builders using stationery, tracing paper, &c., will do well to send to Mr. Frederick Corse, Bedford Row House, Theobald's-road, W.C., for his "Handy Book at a Glance," which can be had gratis, and gives the sizes, prices, and qualities of all office measures.

At the Belfry Schoolroom, Overstrand, Lieut.-Colonel C. Smith, R.E., an inspector of the Local Government Board, held an inquiry on Wednesday week into the application of the rural district council of Erpingham for sanction to borrow £300 for works on sea defence, to be carried out from plans by Mr. A. E. Gray, C.E., of Norwich, and Mr. A. F. Scott, the surveyor to the rural district council.

At the last meeting of the Darwen Town Council, yesterday, it was decided that Belgrave-square, which has been an eyesore in the centre of the town for many years, should be laid out at a cost of £1,500.

The new clubhouse just erected at Upper Clifton, Bangor, County Down, for the Royal Ulster Yacht Club, of which the Marquis of Dufferin and Ava is the commodore, was formerly opened on Wednesday. It has been erected from designs by Mr. Vincent Craig.

## THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXVI.—No. 2311.

FRIDAY, APRIL 21, 1899.

## UNITY OR DIVISION OF AUTHORITY.

THE London Government Bill, with its proposal to create forty boroughs having their own separate jurisdictions, has caused a little flutter amongst the district surveyors of the Metropolis, and especially amongst that august body in Conduit-street to whom is intrusted the statutory authority of examining candidates for the office of surveyor. Many of these gentlemen have been suddenly awakened to the fact that the contemplated legislation will seriously affect their status and functions. They are now responsible only to a central authority; their qualifications and experience are of a high order, and entitle them to direct and supervise buildings of architectural pretensions, and they are experts in the requirements of the London Building Act. These qualifications enable them to take an independent position, and to administer the Act without prejudice, fear, or favour. Independent alike of local influences and vestry bias, they exercise a salutary control over building owners in the Metropolis. These undoubted advantages will be somewhat threatened if the Bill before Parliament becomes law in its present form. The general tendency of the measure will be to decentralise the powers now vested in the London County Council. The borough council will henceforth become an authority, and the district surveyor's position and powers will be curtailed. From a general survey of the provisions of the Bill as it affects building legislation, there seems some room for misgiving. Thus, under the second part of Schedule II., the borough councils will have the chief power in exercising authority in cases of offence under the Building Act. The Council will have the power to convict persons under section 170; the Council, in short, must obtain the conviction before it can be exercised. Under this exercise of authority we can fully appreciate the second point urged by the Council of the Institute, that "it is of the utmost importance for the proper carrying out of the Building Act that district surveyors should be independent surveyors responsible only to a central authority, and not merely officials of a single corporation, and therefore subject to local control." We all know the effect of local influence and prejudice exercised by borough corporations, and the same consequences are to be feared in the newly-formed councils, of which there will be forty. These bodies will possess in time an independence of their own, though scarcely so objectionable as the vestries. Being larger, they will possess wider sympathies no doubt; but, on the other hand, their powers will be greater for good or evil. According to one clause, No. 6 of the Bill, there will be rivalry in the exercise of powers between the London County Council and the borough councils. It is provided that the Committee of the Privy Council is to make a Provisional Order determining which of the powers under the London Building Act, or any amending Act, are to be exercised by the London County Council and borough councils respectively and the conditions under which they are to be exercised. The order also may embody such modifications of the London Building Act as may be thought expedient. The object of this clause is to transfer powers—to give to the borough council an opportunity to alter or revise the Building Act as they think best for their own interests. Every council, we may be sure, will avail themselves of this power as far as

they can, and in some respects the modifications made will be of service. The fear is, however, expressed that the unity of the Act will be whittled away, and that each borough will have its own regulations. We do not share this view; the central authority will prevent any needless alteration of the regulations, the London County Council will still exercise all that is essential for sound construction, the borough council being permitted only to make such provisions as may be necessary to protect existing local interests. The object of the clause is made clear in the last words, "and such provisions for the protection of existing interests as may appear expedient in giving effect to the determination." The district surveyor naturally resents any interference with his functions. The idea of building inspectors under the control of borough surveyors is more than he can stand. And from what class are these inspectors to be taken? No doubt the district surveyors will in most cases become the borough surveyors, and will want subordinates to act under them.

The chief question is how the new Bill will affect building in the Metropolis. Several points have been raised. It is asserted that architects practising in London will have much difficulty in complying with the by-laws of forty different corporations; that architects of important public buildings "object to subject themselves to the direction of anyone who is not a qualified and experienced architect, and independent of local influences." These are strong reasons. The architect would have to be posted up in the requirements of numerous borough councils, with no central authority to back him, and to submit his plans to officials who have a very imperfect knowledge of architectural requirements. These objections may be exaggerated; but the architect would rather deal with the district surveyor, amenable only to a central authority, and thoroughly qualified to consider his design on its individual merits, than with a divided authority largely influenced by local views and prejudices. Whether there is a sufficient cohesion to unite the various councils under the new scheme is not quite assured. The theory of the Bill is in itself good: it is to avoid the present friction between vestries and the Building Act, and to treat London as a whole, yet preserving to each district its local character. But the borough corporations must be regarded as parts of a huge Metropolis, not independent bodies, and so long as this can be secured by proper legislature and administrative machinery there is little to which objection can be taken.

The last points raised by the appeal refer to the great difficulty experienced by the very varied character of sanitary and other by-laws at present enforced within the London area, and it is hoped "that the London County Council will issue to each proposed corporation by-laws as to sanitary and other matters affecting buildings which shall be compulsory throughout the whole London area." We may mention here the London County Council have been engaged in drawing up a series of such by-laws relating to the construction of drains, soil, and waste-pipes that shall apply to the entire county of London. Every architect and builder knows how vexatious the alterations and requirements are imposed by the vestries, who have the chief control over drainage. In many cases what is required under one vestry is repudiated by another. Then as to the legal enforcement of some of these regulations, there is much doubt and perplexity. As to the splitting up of by-laws relating to buildings in the Metropolis objection is taken, and rightly. Any attempt in this direction would be fatal to any scheme of unification which should be the chief aim of the proposed legislation. Any alteration as to building regulations

would be a mistake. The clauses which most affect building are those we have referred to—5 and 6. So long as these clauses are restricted in their operation to the simple transference of powers, that none of the essential regulations of the London Building Act be independently altered by the councils, and that powers transferred should be limited to local matters only, there need not be much alarm. The Bill is mainly one dealing with administrative powers, in which there is room for amendment. Everyone who has had experience of building operations in London knows that there is room for improvement in the administration of the Act. Before the consolidation of the various enactments relating to streets and buildings in the present Building Act, there was much complexity and confusion. Much still remains to render the law as it stands easy of comprehension and application. There are several Amendment Acts: there is the Metropolis Management Amendment Act, which refers to roads, sewers, and drains; there is the Public Health (London) Act, 1891, referring to nuisances, regulation of closets, underground rooms, water provision, also various by-laws under the last Act, all of which have to be consulted by the architect if he hopes to keep clear of trouble. The vestries, too, exercise conflicting authority in matters of drainage and foundations. Many vestries and district boards have rules and by-laws of their own, which often cause much delay and friction. We have lately heard a good deal about the anomalies of the existing system of administering the law. Not long ago, at the Surveyors' Institution, a paper was read on "The London Building Act and the Official Supervision of Buildings," and the author pointed to the anomaly of having two surveyors—one responsible to the Council and the other serving the local authority, and both going over the same ground (?); and he proposed that the two officers should be rolled into one responsible to the local authority, as the borough surveyor is now. In short, the proposal was the transfer to the local authorities of the Metropolis of duties now discharged by the district surveyors. Administrative economy would, it was claimed, result from this transference. The Metropolitan vestries approved of the transfer. The present Bill is really based on these proposals, and is an endeavour to remedy the defects of the present overlapping. The district surveyor exercises no supervision outside the statutes which appoint him, and this is one of the admitted weaknesses of the present administration. The main thing is to simplify and expedite the administrative machinery. One of the chief instruments to accomplish this is supervision. The district surveyors are the most competent men to intrust with this work. We can hardly imagine the parish surveyor undertaking the supervision of important architectural buildings, or buildings in a dangerous condition. Perfect independence is necessary in carrying out these duties with any satisfaction, and for this purpose the surveyor with a central authority at his back has the advantage.

## ESTIMATES.—IV.

## CONCRETE—BRICKWORK.

IN estimating bills of quantities, items for hoarding for buildings in town often appear. The kinds of hoarding are so numerous that it is difficult sometimes to ascertain without a section or sketch what is intended. Prices for hoarding are often guesses in consequence, and the only way is for the estimator to take out the quantities of the rough boarding, posts, rails, struts, and other items, and obtain the amount of cube feet of material and labour. Speculative contractors put down 10s. to 12s. per square

for the boarding, and for footway, with post and rail fence, 1s. 6d. to 2s. per foot run. We have shown how the value of concrete may be arrived at. Many builders assume that there is a lot of rubbish that can be used in the aggregate, and they price low accordingly. A layer of 12in. deep of concrete would be equal to one-third of the price of a cubic yard, and a 6in. layer would be one-sixth of the value of a cubic yard; add to these the price for levelling per cubic yard. A 6in. layer under paving would require twice as much labour in levelling as a layer of 12in.—i.e., per cube foot.

32 yards cube. Concrete composed of ground lime; Thames ballast 1 to 6, including wheeling, and filling in to foundations.

This may be put at 11s. 0d., including wheeling.

	£	s.	d.
Taking 1 yard of lime at 14s. ....	0	14	0
Yards of Thames ballast at 7s. 6d. ....	2	5	6
Divide by 7 1/2	19	6	
Add labour .....	0	8	4
	0	1	6
Profit 10 per cent. ....	0	9	10
	0	0	10
	£	10	8

Or, say, 11s. per yard.

If the same item includes Portland cement, 5 parts of ballast and 1 of sharp sand, add, say 2s.

The cost of a yard of Portland cement concrete, 1 of cement to 5 Thames ballast, may be found as follows:—

	£	s.	d.
5 yards of ballast at 7s. 6d. ....	1	17	6
21 bushels of cement, at 35s. per ton ...	1	16	9
Allow for voids in ballast and cement, say 30 per cent., say .....	0	10	9
Divide by 6 1/4	5	0	
	0	14	1
Add labour, &c. ....	0	1	7
	0	15	8

These prices are for materials brought to site. Add for wheeling and filling barrows.

50 yards super. Surface for paving, levelled and rammed, with 6in. layer of lime concrete, levelled and grouted with lime.

	£	s.	d.
1 yard super. of lime and ballast concrete (one-sixth yard) .....	0	1	10
Labour, levelling and ramming .....	0	0	3
Surface grouted with lime .....	0	0	4
Labour .....	0	0	2
	0	2	7
10 per cent. profit .....	0	0	3
	0	2	10

22 yards super. 6in. lime concrete under paving. If the concrete is of rough core and ground has lime levelled for paving, we may put 1s. 7d. per yard super. for this item; or the 6in. thickness may be regarded as the sixth of a cubic yard taken at, say, 9s. or 10s. per yard; and take one-sixth of this amount, say 1s. 6d. added to labour, spreading, say, 2d., making 1s. 8d. per yard in all.

15 yards super. Concrete ground lime and pit ballast gauged 6 to 1 under paving 4in. thick, including levelling and ramming.

Price this at 1s. 8d. per yard; if with Portland cement and ballast, add 4d.

#### BRICKWORK.

There is an appreciable difference in the estimates given by authorities of the elements that go to make up a rod of brickwork which depends on the size of brick or their number to a rod. Laxton estimates to a rod of brickwork 4,352 stocks, 1 cubic yard of lime, 3 1/2 yards of sand. Gwilt gives the number of stocks at 4,500, 1 1/2 hundred of lime (27c.ft. to the hundred), 2 loads of sand. Others estimate the number of bricks at 4,250 or even less. It is obvious these various estimates are owing to the size of bricks and degree of closeness of the joints. For ordinary purposes we may take the number of stocks as about 4,250 to 4,350.

A rule for ascertaining the price of brickwork with 15 per cent. profit, given by Laxton, is: "Multiply the prime cost of brick delivered by five, which will give the value per rod, to which add the price of labour and mortar." Thus, if brick cost £2 per thousand, then £2 x 5 = £10, to which add, say, £5 10s.

for labour and mortar, making £15 10s. per rod.

230 rods 20ft. reduced brickwork in mortar.

Considerable variation in the price of bricks exists, and, of course, much will depend on the quantity required, the cost of carriage, &c. Suppose the bricks to cost 40s. per thousand delivered, and the quantity of bricks at 4,250 to the rod. Suppose also the cost of grey lime to be 13s. 6d. per yard, and 3yd. of sand and wheeling at 7s. :—

	£	s.	d.
4,250 bricks delivered at 40s. ....	8	10	0
1 1/2 yd. grey lime, per rod .....	0	16	10
3 yds. sand and wheeling, at 7s. ....	1	1	0
Labour, including rough arches .....	4	5	0
	14	12	10
10 per cent. profit .....	1	9	3
Per rod .....	16	2	1

If there are stone dressings or timber to any large extent, these should be deducted from the brickwork. Scaffolding is generally put at about 4s. or 5s. per rod.

35 rods reduced brickwork in mortar in best gault bricks.

If the bricks are 50s. per thousand delivered, the sum may be as follows:—

	£	s.	d.
Bricks delivered at 50s. per 1,000 .....	10	12	6
1 1/2 yd. grey lime, per rod .....	0	16	0
3 yds. sand and wheeling .....	1	1	0
Labour and profit, per rod .....	5	0	0
	17	9	6

Laxton prices Kentish gault bricks at prime cost delivered at £18 8s. per rod.

Leaning gives an analysis of a rod of brickwork with one of ground has lime to two of sand, allowing for one-third waste, and having 3in. mortar joints, as follows:—

	£	s.	d.
3,900 bricks at 34s. per 1,000 .....	6	12	7
75c.ft. of sand at 6s. per yard .....	0	16	8
37 1/2 c.ft. of lime, 26s. ton average	1	5	0
30 bushels = 8d. cube foot .....	0	1	0
Water .....	0	1	0
Labour building .....	2	15	0
Labour mixing mortar, 7 1/2 yds. at 3s. 4 1/2d. ....	0	9	3 1/2
	12	0	0 1/2

The following prices may be adopted in a suburban district where bricks can be delivered at 37s. 6d. per thousand. To the wharf charge, say, 30s., must be added unloading, carting and, stocking within the distance required, if two miles, say, 7s. 6d. For domestic work, where there are numerous flues, voids, and timber, 4,000 bricks may be

taken roughly from courses to the foot. The item is—

42 rods reduced brickwork in mortar—

	£	s.	d.
4,000 stocks, at 37s. 6d. per 1,000.....	7	10	0
1½ yard greystone lime, at 13s. 6d....	1	0	6
3 yards sand, and wheeling, say 7s. ....	1	1	0
Labour, including rough arches.....	3	2	6
	12	14	0
Profit, 10 per cent. ....	1	5	0
	£13	19	5

Say, £14 per rod. The above may be taken as a competition price. It is rather low, 15 per cent. profit would not be too much for a good class of domestic brickwork.

To make an accurate estimate of a rod of brickwork, it is necessary to find the proportion of bricks to mortar or the number of bricks required. The thickness of the mortar joints, size of bricks, voids, &c., have to be determined to arrive at this result. Mr. Leaning, in his able "Notes on Prices," makes such a calculation. He takes a 1 1/2 brick wall, with the usual sized bricks, 8 1/2 in. by 4 1/2 in. by 2 1/2 in., with 1/2 in. mortar joints, four courses of which, with the joints, making 12in. He calculates the cubic contents of beds, transverse joints, and longitudinal joints. These make 54c.ft. of mortar. If we deduct this quantity from 306ft. cube (in one rod) we get 252ft. cube of brick, and this divided by 8.52, the cube contents of a brick, gives 4,259 bricks as the quantity necessary for a rod with 1/2 in. joints. By a similar calculation, it is found for a two-brick wall that 4,276 bricks are required to a rod. Large bricks make a considerable reduction, and, roughly, 3,000 may be taken. Waste in cutting and breakage is also to be taken into account, and five per cent. will be sufficient to cover these. Taking an average, the number of bricks for dwelling-house work may be put at 4,250 bricks per rod, after deducting for voids like smoke-flues.

Other allowances, such as the shrinking of lime and sand to one-third the bulk, are made, and the several elements in a rod of brickwork with 1/2 in. mortar-joints may be stated as follows:—

	£	s.	d.
4,250 bricks at, say, 40s. per 1,000 .....	8	10	0
54c.ft. of sand, at 7s. per yard .....	0	14	0
27c.ft. of lime, allowing 2 to 1 at 12s. per yard .....	0	12	0
Labour building .....	3	0	0
Mixing mortar, 2 cubic yards 3s. 4 1/2d., and water .....	0	7	9
Cost per rod .....	13	3	9

If there are 3,900 bricks per rod with 3/4 in. joints and 75c.ft. of sand, and 37 1/2 c.ft. of lime, and the other items as above, the cost will come to a trifle less. We now estimate the following item:—

26 rods of brickwork in cement, one of cement to three of sand:—

	£	s.	d.
4,250 bricks at 40s. per 1,000 .....	8	10	0
54c.ft. (2c. yards) of sand at 7s. per yard	0	14	0
18c.ft. of Portland cement, at 1s. 6d. ....	1	7	0
Labour, building .....	3	15	0
Mixing 2 cubic yards at 3s. 4 1/2d. ....	0	6	9
	14	12	9

These sums are without profit; they would also bear 15 per cent. for work in small quantities.

130ft. super. Extra brickwork in cement:—

This item is intended to give the extra value of cement to be substituted for ordinary mortar. We have to find out the quantity of cement required, and deduct the cost of lime in this quantity of feet reduced brickwork.

If a rod of brickwork requires 36 bushels of Portland cement, and the same of sand at 1 to 1, let us take, say, 20 bushels of cement for this quantity—

	£	s.	d.
20 bushels of cement at, say, 2s. ....	2	0	0
Deduct 2 yards lime at 13s. ....	1	6	0
	0	14	0
Extra labour .....	0	12	0
	1	6	0
Profit 10 per cent. ....	0	2	6
	1	8	6

Or, say, 2 1/2d. per foot.

The easiest way to obtain the "cost of extra only in cement" is to deduct the price of a rod of brickwork in mortar from a rod in cement. If we take, as before—

A rod of brickwork in cement at .....	£ s. d.
Deduct price of rod in mortar.....	14 12 9
	13 3 9
	1 9 6

We may allow for ordinary work in cement both sides fair, 1s. per foot reduced.

82ft. super. half-brick walls built in cement:

Add this to the price of brickwork in mortar.

If the cost of a rod of reduced brickwork in mortar is .....	£ s. d.
Add for cement extra, say .....	15 0 0
	2 10 0
	17 10 0

This is the rate of about 5d. per foot super., half-brick. Laxton puts for extra labour to half-brick walls in cement 1½d. per foot super.

65ft. super. Extra for brickwork worked fair both sides:—

The cost for working both sides fair is about 5s. per rod. Therefore, put this item down at about ¼d. per foot super. extra labour.

96yds. super. Joints struck fair:—

This is a superior kind of jointing, and may be put down at about ¼d. per yard.

32ft. super. Rough cutting to gables, &c.:—

This is worth about 1d. to 2d. per foot.

This item may refer to many kinds of cutting, and can only be priced correctly by knowing what it applies to. The waste is sometimes considerable, and has to be taken into account in calculating the number of bricks required. In cutting bricks for closers there is waste, especially in buildings with a large number of openings. Then there are birdsmouth, splayed jambs, skewed backs, and all kinds of rakes. For the cutting to rake of gable at an angle, there would be several bricks cut to waste in every superficial foot of 1½ brick walling. The cost per foot for cutting and waste to a gable of ordinary pitch would be about ¾d., or, say, 1d. per super. foot.

12ft. super fair cuttings to rakes:—

Put this item at 2½d. or 3d. It will depend largely on the waste and the kind of cutting.

36ft. run. Labour rough cuttings to 4in. plays:—

Price this item at 2d. to 3d. per foot for good work.

62ft. super. Half-brick trimmer arches in cement and concrete filling to haunches:—

This item may be priced at from 5d. to 6d. per foot. We may add, say, ½d. or ¾d. to the price of half-brick cement wall for extra labour in the curved arch. If we put the price per foot reduced of a brick wall in cement, both sides worked fair at 12d., then this divided by 3, the value of half-brick arch, equals 4d.; and add to this the concrete levelled up to haunches about ¾d., we shall have 4½d., say 5d., per foot.

22ft. super. Rough cutting to ramps in brickwork:—

This item may be put at about 1½d. per foot for labour.

15ft. run. Rough-cut bird's-mouth:—  
Say, 2d. per foot.

To correctly estimate the labour of cutting, it is necessary to ascertain the time it takes a bricklayer to do a similar piece of work, or how much he can do in a day or hour. The use of constants in fixing the value of labour is to be encouraged.

14ft. run. 4in. indent, cut, and pargetted:—  
This may be done at 4d. per foot run.

350ft super. Facing in best Malms:—

This may be priced at 4½d. per foot.

## THE ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Association was held on Friday evening, the President, Mr. G. H. Fellowes Prynne, F.R.I.B.A., in the chair. Various donations to the library having been announced by Mr. E. Howley Sim, Hon. Sec., and acknowledged with thanks, the President called attention to the fact that Mr. A. W. Weedon, R.I., would recommence his Water-Colour Class on Saturday (to-morrow), the 22nd inst. Specimens of the work executed last session by students in the class were hung on the screen, and he strongly recommended all members who could afford the time to join this session, as they would find it most enjoyable and helpful employment.

### THE HOUSE LIST

of nominations for Officers and Council to serve in the ensuing session, 1899-1900, was read by Mr. Sim. The announcement that Mr. G. H. Fellowes Prynne had been nominated to serve for a second term of a year as President was greeted with a hearty round of cheering, and the names of the proposed vice-presidents, Mr. E. Howley Sim and Mr. Henry T. Hare were also cordially received.

### CARVING AND MODELLING AS APPLIED TO ARCHITECTURE.

A paper on this subject, illustrated by some eight-and-forty lantern slides, was read by Mr. F. W. POMEROY. The author remarked that the subject of sculpture in its relationships to architecture had been so exhaustively treated by many distinguished authors, that he felt it would be presumptuous on his part to attempt to treat upon it were it not for the reflection that sometimes a practical and homely view treated briefly served to refresh the minds of the advanced, and to start a new train of thought in the younger students. He would at the commencement express his indebtedness to a recent paper by Professor E. A. Gardner, who had given much time and thought to the Early Greek carvings and the methods then in use, and whose opinions agreed in the main with that of the lecturer's sculptor friends, and with the conclusions he himself had arrived at. The history of art in all ages and climates had been one of

### EVOLUTION RATHER THAN CREATION.

Its rise usually followed the formation of a settled government, and its decline rather resulted from the crushing effects of conquest or from the more natural internal decay following its greatest development. When a nation settled down into cities the handicrafts developed into arts, and from the ranks of the many artisans stepped forth the few artists. They had the builders, stonecutters, and carpenters, whose artistic development was architecture, sculpture, and painting. Architecture was the tree, the parent stem from which sprung sculpture, and through that nearly all the other arts. There was little doubt that the intention of the primitive artist was to imitate his living models as nearly as possible, and the development of ornament could be traced, if they permitted, from the aboriginal to the Assyrian and Greek art.

### CONVENTIONALISM: ITS VALUE AND PLACE.

The great merit of the early sculptors of the two nations just named was that they appreciated the difficulties of attempting to reproduce in granite or marble literal copies of floral or human forms, and they limited their efforts accordingly. Natural forms, to be admissible in their application to architecture, must be decorative—they must, in fact, be conventionally treated. "Conventionality" was subject to various interpretations; but he was referring to a convention that was the natural result of artistic feeling, where the artist had selected from the infinite variety of nature such forms as he felt himself capable of dealing with. This characteristic distinguished the first promise of artistic style from the crude attempts of the barbarian. The monumental simplicity of Egyptian carvings was a good example of the conventional in sculpture, and showed also the natural development of the sculptor's resources. Working in porphyry, basalt, and granite, severe simplicity was inevitable, and although infinite time and trouble were expended in carrying the work to a pitch of perfection, no attempt was shown to do more than the natural material allowed. The less obstinate and more even-textured marble encouraged the Greek sculptor to greater subtlety of execution; but he never permitted his technical

skill to carry him beyond the true sculptural limits. The invariable rule of the Greek carver was to work from a normal front plane, and cut inwards, and consequently this plane was never exceeded by projecting proportions. Mr. Pomeroiy elucidated this point by exhibiting photographs of the colossal group of two lions from the Gate of the Citadel at Mycenae; he pointed out that the masonic form was distinctly retained in these figures, the outline of the animals being cut in square, while little or no surface-carving had been attempted. The whole was a superb archaic work, and one which could not be surpassed in composition and dramatic force. It was

### EASIER TO TRACE IN AN UNFINISHED WORK

the methods employed in a craft than by examination of a completed object, and for this reason the lecturer drew attention to a clay model he had made, and also to two drawings on the black-board, both illustrating a well-known unfinished statue which lay for centuries just below the quarries at Naxos, until it was removed quite recently to the National Museum at Athens. This statue would have been, if complete, a typical example of the first period of Greek sculpture; it represented the Archaic Apollo type, and was a nude male figure, standing up stiffly, with one leg advanced, but with both arms pinned down to the sides. The lower part of the legs and the feet had been lost. He wished to point out how an Early Greek artist set to work when he intended to make a statue of this type. The first noticeable point was the extreme flatness of the surface at the front, back, and sides so far as the original outline was left. This was most evident in the back. Taken vertically, there was a marked curve, but a rule laid horizontally against the back of the figure at any height would, as the lecturer demonstrated on the clay model, touch every point in the whole breadth from shoulder to shoulder or side to side. In front they saw about the same thing. At the sides there was a similar flat surface of the breadth of the arm; but the outline of the arm itself had been cut in parallel to the back and front plates from the side and parallel to the side planes from the front, so that almost rectangular pieces had been cut out. In order to explain the result, Mr. Pomeroiy showed that he had cut through his clay model horizontally at three points, demonstrating from the torii thus formed that the section was contained by lines parallel to the back and front of the statue and others at right angles to these parallel to the sides. In fact, at most parts of the body the section presented, as could be seen by a glance at the divided model, a rectangular parallelogram, with a smaller rectangle attached at each side for arms. The corners, of course, were not left quite sharp, but they were not sufficiently worked off to disclose the rectangular shape. Now, when one considered the freeness of outlines taken vertically—that was to say, viewed from the front or side—and compared this with the two sets of straight lines at right angles to one taken in horizontal section, that was viewed from above or below, the conclusion was obvious. The outlines of the figures from the front or side must have been drawn freely; the horizontal section at any front was dependent for its outline on two parallel systems of lines at right angles to one another. In other words,

### THE PROCESS ADOPTED

was precisely that followed by a beginner in sculpture now or at any time when he set to work on a rectangular block of marble, and to hew a statue out of it. He first drew an outline in full face and in profile on the front and sides of the block. He then carried these outlines straight through, working from the front parallel to the sides, and from the sides parallel to the original front plane. When that process had been completed, the statue from front to side had the required outline, but in the horizontal section it was perfectly rectangular. When the arms and legs had been similarly outlined and cut in to the required depth, and the face had been a little shaped, the result was a statue in precisely the condition in which they saw that from Naxos, as represented before them by model and photographs. There could thus be hardly a doubt as to the process by which this unfinished statue had been produced, and an examination of a few well-known typical archaic figures would convince that the same rules of production could be applied generally to all works of early structure. Many archaic statues, it would be seen, were square in horizontal section; this was not, however, uni-

versally the case, but was especially characteristic of works of the Ionic and Island schools, and also in the female studies found in the Acropolis at Athens, which, for other reasons, he regarded as the Ionic type Atticised. On the other hand, they noticed a round, horizontal section, especially at the height of the waist, in the Hero of Samos now in the Louvre, and in the early Apollo figures from Boeotia and those from Orchomenos and from the Temple of Apollo at Ptoos. The squareness of shape so apparent in the unfinished statue was also to be observed, with the corners a little more rounded off, in a large number of finished statues, especially in those of the Ionic type to which the Naxian figure evidently belonged, so that they might infer that all were executed by the same process which they could trace in the uncompleted figure. A

SECOND EXAMPLE OF AN UNFINISHED STATUE belonged to a very different period. It was one of a group which came from Rheneia, most of which seemed to be of 4th-century work. The figure under notice probably belonged to Greek sculpture of the finest period of execution, and so might teach them something as to

THE METHODS OF THE ARTISTS of that period in carving out of a block of marble. In the first place, they noticed three small drill-holes over the brow, just in the middle of the statue, horizontally made in a piece of marble evidently left for the purpose, and intended to be worked off when the statue was finished. At the base were two corresponding drill-holes, one in a square hole let in between the feet, and another outside the left foot. These holes must, as any sculptor would see, have served for the adjustment of rod or line, fixed vertically down the front plane of the block along the middle of the figure to act as a guide to the sculptor. That it was so employed was quite clear from a line which Mr. Pomeroy pointed out on the photograph, down the body just behind where a rod thus fixed would have been placed, and which line did not correspond to the curve of the muscles, but actually bounded two easily distinguished different periods in the execution of the work, which could be readily divided into half a dozen stages of development. In the first stage, the rough rectangular block of marble was still left at the back across the whole breadth of the statue up to the shoulders, and was also left at the rear of the head and back to act as a support. In the second stage, the marble, from the feet to the middle of the shin, had been roughly worked off in large chips by the use of the chisel or punch and the hammer, the form of the limbs being only very roughly discernible. In a third stage, the portion of the figure from the middle of the shin up to the junction of the body and legs, the work was similar, but was carried deeper, the instrument here used being a smaller and sharper punch. A fourth stage began above the upper part of the process just described, and here the marble was being worked off by a series of irregular round holes about half to three-quarters of an inch in depth, and an inch or so in diameter at the top. These were scooped out with some rounded instrument, probably a round-nosed chisel or gouge; the work was certainly not that of a drill, which would have executed it with more accuracy and less labour. These round holes were gouged out as a convenient method of removing the bulk of the layer that was hard to be taken off; the sculptor was now approaching his final surface, and therefore was anxious to see more clearly what he was doing as he went on, and to be quite sure what depth his next process would attain. The fifth stage was visible upon the middle of the body and the left half of the front of the abdomen, where it was divided from stage four by the vertical line already noticed down the front of the statue. The whole surface was worked about half an inch deeper than stage three with the same punch, but sharper and more carefully used. The sixth stage was that most nearly approaching completion, covering the upper part of the chest and arms, the neck, head, and drapery. In the folds of the drapery the running drill was used; the rest of the surface was worked over in all directions by a fine claw chisel. The cut was still quite a free one, there being no signs of any appliance to guide the hand or eye of the sculptor except the vertical rod down the front of the block. Of the existence of a finished clay or plaster model from which points were taken by a mechanical process to help in its exact reproduction there was

#### NOT THE SLIGHTEST INDICATION

—a fact of great importance. There was no doubt that in Roman times, and possibly earlier, the use of "punctelli," or points, from a finished model or "proplasma," was employed just as it is in modern times; but it was not universal or even common in good Greek times. Whether a clay model was used at all by Greek sculptors was a different question. Arcesilaus, who was at Rome in the first century B.C., sold his *proplasmata* at high prices, and Pasiteles, who flourished at the same period, spoke of *plastici* as *matres statuariae*. He thought it was more than probable that Greek artists of the best period might have derived help in designing by the use of statues in clay. In fact, he had no doubt about the use of clay models by the Greeks. Phidias could not have made by his own hands a small part of the Parthenon sculptures; doubtless he made models, and employed a number of craftsmen to carry out the work in marble under his supervision. Mr. Pomeroy then passed on to his second subject: the

#### DEVELOPMENT OF MODELLING IN CLAY.

This art was common and customary from the earliest times, and the hardening by drying, baking, and burning led to its use for a variety of useful purposes. The process of working in clay could be considered among the Greeks, as among all other nations, under three heads—first, sun-dried clay; secondly, baked clay, but without a glaze, or terracotta; and thirdly, baked clay, with the addition of a glaze, or porcelain. Sun-dried clay was employed by the Greeks for internal decoration. The use of terracotta among the Greeks was very extensive. It supplied the most important parts, both of public and private buildings, such as bricks, roof-tiles, drains, columns, and other architectural members, the statues of deities for the temples and reduced copies of them, as well as votive figures. Clay was also used for wine-vats, pitchers, and cups, and many other domestic purposes. The desire of rendering terracotta less porous and of producing vessels capable of retaining liquids gave rise to the colouring of its surface with vitreous enamel or glaze. Ancient terracottas in figure work were distinguished from modern ones by their greater lightness and softness. The art of working in clay was of great antiquity, and was claimed both by the Corinthians and the Samians; but it was obvious that it preceded working in bronze or marble. Having referred at length to the tereatic figures, in which metals and clays, and even gold and ivory, were employed for different parts of the figure, the lecturer described the small terracotta figures made as ornaments and household gods by inferior artists, and in a rapid sketch alluded to the distinct treatment of various materials from Egyptian days through the Greeks and Romans; the Gothic and the Renaissance periods, up to the future time, urging that any treatment that brought out the full features of the material and craft must be the right one to adopt.

#### MODELLING IN CLAY OR SOFT WAX

was a system of building up by adding pieces of the material until the surface desired was arrived at. It might be worked with boxwood or ivory tools and shaped wire, but the fingers and thumb were the modeller's tools *par excellence*. The French artists had carried modelling to a very high pitch, amounting, in his judgment, to the loss from this work of the monumental dignity and repose so essential to all architectural work. There was indeed, he felt, in modern French work, notwithstanding its undeniable technical skill, a lack of the true sculptural feeling, and a restlessness which was much to be deprecated. Although we owed much of our training in modelling to French teaching, it behoved our sculptors to avoid falling into the trap set by working in a very facile material. Modelling might be used in architecture for a great variety of purposes—for preparing details of ornament, models for portions or the whole of a building—by which means a general idea of the general effect of light and shade could be definitely arrived at. The author here gave, with the aid of an assistant, a practical and most interesting demonstration of both carving and modelling on prepared clay surfaces raised upon a blackboard. In

#### SUMMING UP HIS CONCLUSIONS,

Mr. Pomeroy pointed out that the real carver naturally worked in a manner which was blocky and geometric, cutting from his front plane down-

wards. The modeller, on the other hand, worked from the back plane outwards, building up his design with finger and thumb piece by piece. The introduction of the pointing machine had caused sculptors to frequently practise altogether in the clay, and thereby lose sight of the true glyptic laws, although he would concede that the advantages secured by the use of this instrument were increased in a busy and impatient age. He urged that a close and careful study of nature by means of drawing was the best means of arriving at a full and proper understanding and appreciation of the great works of the past, and of providing real and living works in the future. The lantern-slides shown on the screen ranged through the whole land of ancient and modern sculpture, including Assyrian bas-reliefs, metopes, and portions of the Pan-Athenaic frieze at the Parthenon; Roman portraiture done by Greek sculptors, Mexican monuments and Indian carvings, works of the Italian Renaissance, including examples of Donatello, Ghiberti, Michel Angelo, Cellini, and Della Robbia; 16th French bas-reliefs by Jean Goujon, and English plaster from the 17th century to the present time, the series being brought to a fitting climax with Alfred Stevens's group of Truth and Falsehood from the Wellington Monument.

Mr. T. STIRLING LEE, in proposing a vote of thanks to the lecturer, endorsed his remarks as to the value an architect could derive from having a small scale model made of his proposed buildings and decorations. He would emphasise the point also that a sculptor was a carver, and not a modeller. In determining the depth of the plan of relief to be adopted, the sculptor needed to know the exact contour of the markings by which a panel or frieze would be inclosed, and the brighter the sunlight the deeper might be the carving; while, on the other hand, if the work were in shadow, the relief must be slighter.

Mr. W. H. SETH-SMITH seconded the motion, remarking that the employment of models was a great aid to the architect. There needed to be perfect sympathy between the designer and carver. In the employment of terracotta for building purposes great restraint had to be exercised by the architect.

The motion was supported by Mr. W. MILLAR, of Fulham-road, Mr. GANDY (who defended terracotta as a facing material), Mr. A. H. HART, Mr. E. HOWLEY SIM, Mr. T. BROAD, and the PRESIDENT; and the vote of thanks, having been passed by acclamation, was acknowledged by Mr. POMEROY.

#### PARIS JOTTINGS AND RECOLLECTIONS. —III.

MY somewhat vague remembrances of the Great Exhibition of 1851, recorded in your issue for the 24th ultimo, have brought to hand several communications in which sundry recollections by others of that altogether unique gathering of the arts and crafts have been recalled. One reminds us that when the late William Morris, at the age of 17 years, visited it, he sat himself down upon the first seat he came to and steadily refused to go over the building, declining to see anything more wonderful in this wonder of the world than that it was "wonderfully ugly"! It is not all of us can afford to live without learning what others can do, and it is more than probable that Mr. Morris, in mature life, sincerely regretted the opportunities he thus lost, by stubbornness, during the somewhat prematurely "cock-sure" age of seventeen summers. A sturdy old veteran is John Webb Singer, of Frome, who has permanently forged himself an everlasting name upon the scroll of 19th-century art-workers, and who, in spite of his four-score years, is to-day as spry as are many youngsters of one-fourth his age. He writes: "My age affords me better opportunities for remembering the 1851 Great Exhibition than does that of most men. I paid it many visits from Frome; the first time (a few days after its opening) I took one of my children, a dot of six summers. The crowd was so intense I carried it everywhere on my shoulders, that the youngster might the better see what was to be seen. The only recollection left upon the then juvenile brain to-day, I find, are some silver owls, ornaments for a side table. My own mind seemed absorbed in wonder and admiration for Hardman's Mediaeval Court. I had only just begun—in those days—to work in metal, and had little idea then that I should live to see myself and sons with some couple of dozen forges for ironwork, a permanent

staff of something like two hundred craftsmen, and more prize medals than I can for the moment name. My next visit to the Great Exhibition of 1851 was mainly to assist my rector in taking up the entire adult population of our Somersetshire home. He took care of the women; the men were in my charge. We had two days there, and, as hardly any of them had ever been to London before, their experiences were as varied as curious. I remember one morning landing one-half of my party from a penny steamer at Old Hungerford Bridge—we had just previously paid a visit to the Tower—the other half followed by the next boat, the one I came by being too full to take the lot. We naturally wanted to wait on the pontoon for the arrival of the remainder; but this intention of ours the pier-master resented violently, and ultimately he rudely ordered us off the landing-stage. Looking at him sternly in the face, I said: "You see these men; they will do whatever I tell them. If you say another word in that offensive style I shall order you to be thrown into the Thames!" Never in this world was a bully brought quicker to learn good behaviour. He perfectly "crawled" to me!

Mr. Singer's interesting reminiscences and reference to Hungerford Bridge reminds me of my early schooldays, when Hungerford Market, its music-hall, and its penny ice shop were in full fling. That was during the time of the Crimean War (1854-6). It was the original Gatti (who afterwards died amazingly rich) who opened the first, and then only, penny ice-cream shop in London. His place was in the market on the right side going down from the Strand to the river. All that was then has passed away now; but the bridge, "a thing of beauty, and a joy for ever," still does good work at Clifton. It was so low down when it spanned the Thames, that its grace and beauty never fully displayed themselves. To-day, in its present elevated position across the Avon, in Bristol's exquisitely beautiful suburb, and amidst the loveliest surroundings conceivable, it stands the most beautiful bridge I know in the world. Clifton's Transatlantic namesake across the river in front of Niagara, joining, as by a thread, the United States with the Dominion of Canada, is, in my opinion, "not a patch" in comparison to it.

Time flies so quickly that one can hardly realise it is twenty-three years ago, that one hot day in June, I struggled up the steps at Montmartre, here on the heights over Paris (those last stairs that break the camel's back), intent upon being present at the laying of the chief stone of the proposed great church of the Sacred Heart. Much work had already been done to the site prior to the religious ceremony, which, helped largely by a bright fine day, and the loveliest of clear skies overhead, was of a most imposing and impressive character. Fully two years later, I again scaled the steep ascent of Mont Martre. The following notes, made upon the spot on that occasion, duly recorded in the *Building News* (October 18, 1878), may, perhaps, be reproduced with interest. They run:—"Built by the Jesuits upon the summit of Montmartre, the church's position is a most commanding one, and the view of Paris and of the surrounding country superb. The work does not at present make much show, for although started fully three years ago, the crypt is only partially built. The style chosen is Romanesque, and the architect is M. Amédée, of Paris. The builders are M. Riffaud and Co., also of Paris, well-known contractors, who erected the Russian Church in Faubourg St. Honoré, and are now rebuilding the Hotel de Ville. The altitude of the church of the Sacred Heart is exactly 267ft, I am told, above the level of Paris." (One would think the elevation is very much higher?) "The length of the church will be 367ft., its width 200ft., and its height from floor to the ridge 100ft. The Campanile will be 207ft. high. It is computed it will take from ten to fifteen years longer to build this church. The architect has already supplied upwards of 2,000 detail drawings, and the size of every individual stone is given thereupon. For the pits alone (i.e., the foundations under the floor-line of the crypt) 150 detail drawings averaging 2ft. 1in. by 1ft. 9in. have been supplied. These foundations go down 11ft. beneath the crypt. . . . Although Sunday work in Paris is the general thing, no one is allowed to work on this church on that day. The Jesuit employers impose a fine of 500 francs upon the contractors for every infringement of this rule. . . . Most stonework in France is merely

bedded before fixing, then put in place, and moulded where it stands. The Church of the Sacred Heart, however, has all its stones fully masoned before delivery on the works in the quarries at Château Landon, near Fontainebleau. It is a hard material, quite unlike the general run of stone used in Paris. It is 'tooled' over the face, and so left finished. The crypt, scarcely half-up, will consist of 22 courses, averaging 1ft. 6in. high. Its roof will be of vaulted stone, and so will that of the church itself."

From the day the above lines were written until a week ago, although often in Paris during the interval, I have never once repeated my visit to the church. During those 21 years the works have continued to progress very slowly. The main portion of the fabric, however, may now be said to be practically finished. The central dome, surrounded by a bird-cage-like labyrinth of dirty and time-stained, but strongly-compiled, scaffolding, has exactly half its courses fixed. The rather ugly bell-tower at the south-east corner is not yet commenced. Otherwise, with these exceptions, the actual fabric of the church may be said to be built. An air of poverty and stagnation prevails, however, about the whole atmosphere. The clerk of works' office, and that of the general foreman of works (whose kindly attention and interest on my last visit is still remembered so pleasantly), are both shut up, forlorn-looking and forsaken. There does not appear to be a staff of more than a dozen workmen, all put together, engaged upon the whole edifice. The approaches to the imposing and superbly-situated west end, and to the south and north entrances, consist of flights of wooden steps, painted stone-colour, precisely as were the steps, in somewhat similar positions, at the Capitol at Albany (the most expensive State House in the world), itself the capital city of New York State, when last I saw them. Whilst the carved work generally (that small portion already executed) is strictly in character with the architectural features of the edifice, the large gargoyles, of which there are many, are too Gothic in conception, and do not look quite in place upon such a building.

Talking of gargoyles, I never visit Paris without thinking those upon the exterior of the Cathedral of Notre Dame are amongst the most effectively carved in all Christendom. There is rather a funny story connected with their creation. The *Architect*, in its issue for May 9, 1874, gave a double-page illustration of quite a number of these particular grotesques, and in the letterpress accompanying the drawings in question referred to the wonderful power and artistic skill displayed by the Mediæval carver, who had fashioned gargoyles of a spirited character scarcely within the ability of the modern craftsman to conceive or create. This, of course, was all very well in its way, but an unexplained sequel followed. A week or two later my old friend, Thomas Bromfield (poor old "Brommy" died about ten years ago), wrote to the publication in question, stating that so far from the gargoyles illustrated being ancient or "Early French" work, he had, under the direction of the late M. Viollet-le-Duc, architect for the cathedral's renovation, modelled and carved the whole series himself!

Stories of this kind are not exceptional. Exeter Cathedral's interior was restored by the late Sir G. Gilbert Scott, R.A. (A.D. 1870-77). One afternoon not long after the latter date, a stranger within its gates—evidently a travelling architectural student, was intent sketching the cresting that surmounts the canopy of one of the superb Early 15th-century altar tombs in Exon's Cathedral. "I shouldn't draw that if I were you—it's not worth it!" was my passing casual remark. "And pray what may you know about it?" was the somewhat cynical rejoinder. "Well," I retorted, "simply that I carved it myself less than twelve months ago!" As a matter of fact, the canopy in question (within the memory of that generally supposed reliable citizen, the oldest inhabitant) never possessed a terminal cresting at all until the late Sir Gilbert designed one. As soon as this was carved it was decorated, in unison with the old work immediately below, by Messrs. Clayton and Bell, so now it is quite impossible to tell the old from actual new work.

Although the exterior of Exeter's Cathedral looks old, and grey, and time-worn, of all the 70 pinnacles that bristle about its roofs there is not one of them to-day more than 30 years old. I recollect that three years earlier (in 1866) every

pinnacle—then all built of Beer stone—stood out of plumb. They—every man Jack of them—leaned over, more or less, towards the sun. Since then, by degrees, every one has been renewed in harder stone, and, to-day, all stand perpendicular.

The Exeter Cathedral pinnacles are by no means the only instance of stone being affected by the sun. The church of St. Peter, at Ermington, a village in South Devon, has a tall 15th-century western spire of stone. It leans considerably. The village story goes that many years ago, in the middle ages, a local maiden—a virgin—was married, and as she left the porch, after the ceremony, the steeple bowed in reverence at so unwonted an incident! It has kept so ever since. Needless to add, there are no spires with such a record in Paris!

The interior of the church of the Sacred Heart, it must be confessed, is disappointing. The whole is distinctly cold; its walls and groined roofs are of the same kind of stone as forms the exterior, but little relieved, here and there, by slight polished (Belgium) marble columns;—these latter constitute the minor shafts supporting unimportant arcades. Further, the outlines of all the windows, seen from the inside, are fully as ugly as are those of Lord Grimthorpe's "Five Sisters," and "10 half-crown, 18 shilling, and 9 sixpenny" windows in the transepts of St. Alban's Abbey. The vaulting over the choir is unhappy, in that it suggests the roof of a railway tunnel, or what one might assume the latter to be like could it be seen! The nave is painfully short—as much so as is the late Mr. W. Burges' nave at St. Finbar's new cathedral at Cork; and the nave of Hereford Cathedral has been, ever since its western bays fell down, exactly 113 years ago last Easter Monday.

\* In the four large concave spandrels that go to form the springers to the roof beneath the great central dome are carved in high relief in the solid vaulting as many colossal angels, each with its wings outstretched. Although the sentiment of these overshadowing celestial beings is at once artistic and religious, as a matter of fact these immense figures distinctly dwarf the surroundings. It has ever been so! The palace at Versailles has little of the charm of our own Hampton Court about it, and for why? The huge statues that adorn (!) the approach, on either side, to the former, seem to kill all behind. So too, again, at Cologne Cathedral. The great sculptured figures upon the piers of the nave arcades deceive the eye to such an extent that it is almost impossible to realise that from the line of floor to the under one of key of vaulting is a distance of 160ft. Yet, on the other hand, circumstances of necessity alter cases. The immense statue of Liberty, by M. Bartholdi, in New York Harbour is 213ft. high, and not a bit too big for its surroundings. Indeed, the query sometimes suggests itself as to whether it is large enough. It is the easiest thing in the world to miss seeing it when approaching New York in an Atlantic steamer from England. I speak, of course, in fine weather. It is my experience that, nowadays, New York Harbour is almost as much given up to fog as is our own Thames, and, as often as not, when hailing Sandy Hook, you can see nothing.

Again, in the grand high altar screen at Winchester cathedral, the quite recent addition of the crucified Christ upon the central cross is another instance of inadvertently overlooking scale, and the unfortunate results of such an omission. The western façade of this 15th-century example of Caen stonework consists, in the main, of a series of niches, in which are over a score of life-sized statues and nearly double that number smaller ones. These are niches clustered around a great central cross measuring, speaking roughly, about 18ft. by 10ft. The original idea of Cardinal Beauford undoubtedly was that as the worshipper approached the shrine, the figure of the emblem of salvation, the crucified Christ, should be the one great feature first seen, and that the occupants of the half a hundred and more niches should be accessories, altogether secondary in the general composition. As a matter of fact, a central figure, about the same size as those in the adjacent niches, now hangs suspended; but, being practically nude, it looks smaller. Hence it is positively less commanding than are the draped ones of the Blessed Virgin and St. John the Divine which stand on the north and south sides respectively. Thus much of the spirit of religious sentiment is lost in the grouping,

whereas a large statue, its clue taken from the dimensions of the existing old cross itself, would have given a majestic dignity and realisation to the whole, an impression, once seen, perhaps, never forgotten.

Truro Cathedral enjoys a questionable reputation for having the names of donors placed upon so many of its special gifts; but in this respect it is not in the running with the church of the Sacred Heart at Paris. The latter, may be, is not quite so bad as things, in this particular way, are at Chicago. I remember once going into a church in the latter city, where all along the plinth of the altar in large letters was writ something like the following:—"John Smith, pork-canner, gave this in memory of his wife, Sarah Smith, 1892." Almost everywhere in the "Basilique du Sacré-Cœur de Montmartre" are inscribed stones bearing the names of their respective donors; these names are legion. Happily they are not cut in, but merely painted in 1½ in. red letters; many are already fading, and probably all will be erased by the stern hand of Time during the next 20 or 30 years.

The present fittings in the new church are, of necessity, *pro tem*. Yet, even as such, they are painfully plain. The many altars are nearly all alike, and, like the seats and other furniture, are of varnished deal or pitch-pine. All is in the regulation school-board style—just the same sort of thing as one sees in the Board-School fitting-shop in the Strand, W.C.

In the chapels on the north side are one or two large and exceedingly fine marble statues, fixed (for the time being, of course) upon wooden pedestals.

The crypt is massive, but not impressive; the outlines of its windows, intensified, as they are, by the internal gloom, are, each and every one, disappointing. Where the hard, white light pouring in has, however, been softened by stained glass, as in the window at the west end of the north aisle, the artistic effect is decidedly pleasant. The floors are laid with a composition stone—false jointed apparently ("the dim, religious light" renders it difficult to be quite sure on this point)—in 2 ft. squares. This floor and other surroundings go far to help the idea that, instead of a crypt, one is in underground vaults beneath a railway station.

And now, in bringing this triplet of lazily-written papers to a close, the thought suggests itself, Where is the typically dressed Parisian *ouvrier* of a quarter of a century ago? The wearer of the blue blouse, the baggy canvas overall trousers, black alpaca cap, and wooden sabots? Once seen at every hand and corner, he is now a *rara avis* in the streets of Paris. Lack-a-day! this is indeed an age of advancement. Is it not a fact that all stations and conditions of men seem to aim at getting more like their "betters"—more or less—more than less!—every year? The very—

Cobbler who sits at our gate,  
Now pensively points his hog's bristle,  
Though the very same cobbler of late,  
O'er his work used to sing and to whistle!

Such, then, is the "March of Intellect," and with a vengeance!

And now, with a self-imposed task concluded, we gladly bid adieu to this wretched Parisian climate, and his back, with genuine satisfaction, to the blue and sunny skies of England's fairest county—Devon!

However so humble,  
There's no place like home.

Rue de l'Arcade, Paris. HARRY HEMS.

P.S.—For "the piers are up to the parapets," in the last article (p. 506, col. 3, line 24), read "the walls are now up," &c.

#### THE DRUIDS' ELECT.

FOLLOWING the pleasant custom of recent years, the annual *soirée* of the Architectural Association, to be held at St. George's Hall, Langham-place, W., this (Friday) evening, takes the form of a topical musical burlesque entitled "The Druids' Elect: an Episode of the Ancient Britons," written for the occasion by Messrs. G. B. Carvill (one of the hon. secretaries of the Association) and Gervase Bailey, the music being composed by Mr. Leonard Butler.

A preliminary performance, to which members of the Association and ladies were invited, was given in the same hall on Wednesday evening.

The story is somewhat different in character from that told at these entertainments during

recent years, the scene being laid in Britain *circa* 55 A.D., and the plot turning on the rivalries of two architects representing respectively Art and the Reform of the Profession, for a seat on a council, and the machinations of a wily old impostor who poses as Archdruid, and for a bribe from the Reformer decrees that the daughter of the representative of Art shall be sacrificed to the gods. The love of a young lieutenant for the daughter, and the revenge of the well-connected and elderly woman to whom the youth is already engaged, form elements in the development of the play, which is less richly besprinkled with topical allusions than has been usual in these A.A. burlesques. No attempt is made either in the make-up, gestures, or mannerisms of the leading characters to caricature well-known living architects—a feature which, if it detracts from the piquancy of the performance, is an improvement in taste and propriety on some of the earlier plays.

The principal characters are Lucius de Rougepot, né Griennius, the Archdruid, taken by Mr. Herbert Passmore, who is made up as a vulgar adventurer of commonplace type; Ashlar and Rubble, Ancient Britons, candidates for the Council, represented by Mr. Alfred Stalman and Mr. G. B. Carvill respectively; Owen Rent, First Druid, Mr. Frank Carvill; Rodesius, General in Command of the Roman Chartered Company's Forces, Mr. F. D. Clapham; Superfinus, a Roman Lieutenant, taken by Mr. S. Constanduros, whose handsome appearance and baritone voice well qualify him to undertake the part of the lover and hero of the play; Penialinus, a war correspondent, Architopius and Toplinus, young architectural students, all impressed into the Roman army of occupation, Messrs. Gervase Bailey, Frank Foster, and J. Hayes Wilson; Letitia, a Roman lady of uncertain age betrothed to Superfinus, Mrs. Alfred Stalman, who certainly did not look to carry the mature years her part demanded; five British maidens, the Misses Ada Yerbury, K. Rimell, Blanche Selig, Dolly Jennings, and Ethel Atkins; and Blodwen, Ashlar's daughter, Miss Sophie Tyler. Other eight ladies and a dozen gentlemen appear in subordinate parts in the chorus of Druids, Romans, and British maidens. Mr. G. B. Carvill is the stage manager.

The curtain rises on a scene representing sunrise in a forest, and after an opening chorus, "Oh, Light and Life," by Druids and girls, the men withdraw, and it is gleaned from the damsels' conversation that formerly the reigning Archdruid doomed once a year a maiden as a victim to the deities; but that all this has been changed since the arrival of Lucius de Rougepot, the new Archdruid and prophet, who has decreed that human sacrifices should cease—until the gods shall ask their own again. Rougepot had, it seemed, opportunely come into the forest bestriding a crocodile, and playing his lyre as an accompaniment to the chant "Wearing of the Grin," just when the old Archdruid died, and was at his own suggestion elected as successor. Just then Blodwen, the daughter of a leading architect, one Ashlar, comes in and says she has had a terrible dream, which, although it ended happily, has filled her with dread. A girl's suggestion that "The Morning Star," of which she sings in a tuneless lay, may be a lover hardly allays her fears. The Druids re-enter in procession chanting "We carry on the Priestcraft." There is, it appears, to be an election upon some council, a vacancy having occurred through the death of the lamented Stucco, and two well-known and most respected architects, Ashlar and Rubble, are said to be hard at work canvassing. Both the candidates come forward and protest against being supposed to do anything to influence the electors. Ashlar produces the *Antediluvian Advertiser and Neolithic News*, a professional journal of the period—incribed, by the way, upon a bearskin—containing an article on the respective merits of the candidates, in which the writer ingeniously sits upon the fence; but both he and Rubble, after scanning the leader, find that pressing engagements preclude them from reading it aloud. The Druids' discussion on election prospects and promises is interrupted by the entry of the Archdruid Rougepot, who imparts much more sensational news—viz., that an exploring party of the all-conquering Romans have landed under their general, Rodesius, and propose to introduce to Britain all the blessings of civilisation. While the archdruid is singing a song, "Limited," explaining the nature and objects of "The Roman Chartered

Company of Great Britain, Limited," his audience slip out behind his back until he is left alone. Soliloquising, he decides not to reveal his identity to the Romans, as it would spoil an otherwise passable plot; and besides—he reflects—he is very comfortable where he is. Ashlar coming in to consult him about his chances at the election, the wily one says he had a vision the previous night, when he was visited by fifty kings—sovereigns—from the East. Ashlar declines to give a bribe; but when a like suggestion is made to Rubble, the bait being now raised to eighty sovereigns, he promptly hands over the bags of money, the Archdruid explaining that, although he cannot influence the election, he may be able to induce one of the candidates to retire from the candidature—if, for instance, Ashlar's daughter, Blodwen, were demanded as a sacrifice to the gods. The Roman general and a small detachment of his army here enter, and state that they have come to stay until after the election. Rodesius endorses the Archdruid's decree that the successful candidate shall give his greatest treasure, which Ashlar at once interprets as his daughter. Meanwhile Blodwen is indulging in a mild flirtation with Lieutenant Superfinus, who is engaged to Letitia, the middle-aged daughter of the Roman Emperor's cousin, and who, it appears, has instigated the proposed sacrifice from jealousy of the pretty daughter of the architect.

In the second act, a chorus of girls, after singing a "May Day" song, rebel against the system of sacrifice, and discuss the expediency of emigrating to a land where females' rights will be respected, where indeed women will reign, and bragging, cowardly man will only be allowed to live in slavery. Rubble and Rougepot also discuss the situation, which they agree has become serious, and they end by singing a duet, "We are sadly in need of resource." Blodwen mourns her fate, and Ashlar, in a stormy interview with Superfinus, says he would sacrifice a hundred daughters, did he possess them, to Art, to Duty, and to Heaven. While the young Lieutenant is puzzling over the problem, his betrothed, Letitia, appears upon the scene, and laughs to scorn his entreaty that she will get the emperor to interpose and stop the sacrifice. Rougepot is in the act of offering his heart and hand to the mortified Letitia, when a procession of Druids and Romans enter to the strains of the old chant, "We carry on the Priestcraft," and, prompted by Ashlar, Rodesius lays the foundation-stone of a temple. He afterwards explains that at Rome last year they founded an institute for the promotion of elementary knowledge among architects—a committee was formed, an Act passed making it compulsory to graduate, exams. were held, fees taken—but no students were passed. Rougepot dismisses the assembly till next evening, when the sacrifice is to take place. In the mean time Superfinus persuades Blodwen to fly with him, and to bring her father with her, but this proves unnecessary. Rodesius, in a well-turned parody of Marc Antony's oration, denounces de Rougepot, and his briber, Rubble, and extols the virtue of Ashlar. The Archdruid reveals himself as the long-lost Griennius, Letitia's earliest love, who disappeared after raising the wind with a new diving machine, and Superfinus, thus set free from an embarrassing engagement, intercedes with the populace for the life of the old impostor. Thus a happy issue is provided for all, and the curtain falls on a gratified assembly.

On Wednesday evening—the ladies' night—the body of St. George's Hall was packed with an appreciative and indeed enthusiastic audience, most of the songs being encored, and every pun and salient point received with applause. And after the fall of the curtain, in response to loud and repeated calls, the joint authors—Messrs. Carvill and Bailey—appeared before the footlights and bowed their acknowledgments. The play went off smoothly, and without a hitch, all the performers being letter perfect in their parts, and the burlesque must be pronounced the most successful yet given under the auspices of the Association.

The Local Government Board have given their consent to the extension of the boundaries of the borough of Harrogate. The new boundaries are to include Starbeck and the populous portions of Pannal, and also Bilton.

The death is announced of Mr. F. Sargent, a painter well known in his day for his pictures of the Houses of Lords and Commons, the Queen's Garden-party, and other similar popular subjects.

GOVERNMENT BUILDINGS FOR THE STATES OF GUERNSEY.  
—GATEWAY OF ST. JOHN'S COLLEGE, CAMBRIDGE.—  
NEW GOVERNMENT OFFICES, PARLIAMENT STREET.—THE  
TERRISS THEATRE.—WESLEYAN METHODIST MISSION-  
HALL, EDINBURGH.—PLAN OF THE PARIS EXHIBITION.

## Our Illustrations.

## GUERNSEY STATES HALL.

The chief difficulty in connection with this design was to produce anything like a symmetrical plan on so irregular a site. The centre of the building is occupied by the Great Hall or Salle d'Attente. On the south side of this hall are two chambers for the deputies, the Hall of Deliberation and the Hall of Election, with their necessary committee-rooms, retiring-rooms, &c. Upon the other side of the hall are the Courts of Justice, with their necessary accompaniments, and the rooms for the Bailiff of Guernsey and the Jurats. Immediately beneath the Halls of Deliberation and Election are offices of the solicitor-general, the attorney-general, and receiver-general. On the same floor are the offices of the Greffier, adjoining which is the Record Office, in which will be stored everything relating to the history of the island, including many magnificent illuminated charters dating back to the 12th century. The whole of the work has been designed with a view to the material to be used—the local grey granite, excepting the upper part of the tower and the inner portions of the large windows on the principal fronts, which will be of Portland stone. The estimated cost is £50,000. The architect is Mr. Ed. W. Mountford, of 17, Buckingham-street, Strand.

PUGIN STUDENTSHIP PRIZE DRAWINGS: GATEWAY,  
ST. JOHN'S COLLEGE, CAMBRIDGE.

The college was founded by Lady Margaret, mother of Henry VII., in the year 1505. The gateway is built of brick with stone dressings. Over the archway is a statue of St. John the Evangelist, and below it the arms and supporters of the foundress; her badge, the rose and portucullis crowned, and the daisy and "herb Margaret" are also displayed on the walls and vaulting.

HENRY RUTHERFORD.

NEW GOVERNMENT OFFICES, PARLIAMENT STREET.

THESE illustrations are in continuation of those we have already given, and sufficiently explain themselves.

TERRISS THEATRE, ROTHERHITHE.

THE above theatre, the subject of our illustration, is now in course of construction in the Lower-road, Rotherhithe. The building is being erected from the plans of Mr. W. G. R. Sprague, the architect of many of the new theatres recently opened in the Metropolis. The elevation to the Lower-road is of stone and brick, and will present a very imposing frontage. The auditorium is about 65ft. by 58ft., the dress circle and gallery being constructed entirely without the usual obstructive columns, thus insuring an unimpeded view of the stage from all parts of the house. The auditorium, front block, and dressing-rooms are constructed of fire-resisting material throughout. The stage is about 70ft. wide by about 32ft. deep, with a height of about 60ft. This

portion is constructed of timber, but is separated from the auditorium and dressing-rooms by double asbestos fire-resisting curtain and iron doors. The internal decorations will be executed in fibrous plaster, and the style adopted will be French Renaissance, artistically decorated in gold and colour, in harmony with the prevailing shades of the draperies and upholstery. It is proposed to light the building by electricity, which will be introduced to form part of the scheme of decoration. Gas will also be provided as reserve in event of the failure of the electric light. The building will be heated by hot water, on the low-pressure system, and an efficient and ample hydrant installation is provided.

WESLEYAN METHODIST MISSION HALL, EARL GREY STREET, EDINBURGH.

BUILDING operations will shortly be commenced with the new halls and other premises for the Edinburgh Mission. A site was recently acquired at the corner of Early Grey-street and Wellington-place, the site being at present occupied by St. John's School and two blocks of comparatively new tenements of shops and dwelling-houses. The whole of this property will be demolished to make room for the new buildings now illustrated. A sum of nearly £20,000 having been paid for the existing buildings and ground, it was imperative that an income should be got to reduce the cost of the scheme, and with this object the street and basement floors were planned as business premises. Ten commodious shops with extensive cellars occupy these floors. The main entrance to the hall will be from Wellington-place by a wide corridor leading into a crush room on the mezzanine floor. A wide staircase leads to the large hall on first floor. This hall is planned to accommodate fully 1,700 persons. At one end is provided a large recess for platform and future organ-chamber, with retiring-rooms adjoining. Wide staircases at each side lead to the street as special exits. On the first floor there is also arranged a small hall seated to accommodate over 300 persons, with platform at one end, and classroom and lavatory accommodation at the other. The whole of the upper floors are arranged for classrooms, stores, and caretaker's house, and special regard has been paid to the entrances and exits from these, as well as from all other parts of the building. The shape of the ceiling of the large hall will be semi-elliptical, a form of roof which materially assists the acoustics. Externally the building has been designed in a free treatment of the French Renaissance, and when completed will add considerably to the architectural amenities of the district. The whole scheme has been designed by, and will be carried out under the supervision of Messrs. Dunn and Findlay, architects, Edinburgh. The total cost of the scheme will be £40,000.

GENERAL PLAN OF THE PARIS EXHIBITION, 1900.

THIS plan will interest intending exhibitors at Paris in 1900. We are indebted for it to Mr. Harry Hems, and it will elucidate his articles in the present and last number.

## COMPETITIONS.

BRADFORD.—The Cartwright Memorial Hall competition is now pending. Mr. Alfred Waterhouse, R.A., is the professional referee. The drawings went in on the 14th inst., and no less than 115 sets of designs have been received.

FORMBY SEWERAGE SCHEME.—The author of the scheme placed first by the assessor is Mr. C. A. Atkinson, C.E., practising as Goodison, Atkinson, and Forde, of Liverpool. The estimated cost is £32,000. The sewage will be purified by bacteria and discharged into the sea without pumping.

HEXHAM.—For the new vagrant wards the board of guardians have adopted the plans submitted by Mr. T. Leslie Anderson, M.S.A., 4, Royal-arcade, Newcastle-on-Tyne, submitted under the nom de plume "Arcadian," and hand the author the premium of £20, subject to the approval of the Local Government Board and to the condition that the approved contractor shall be found who will carry out the work for £2,000.

In the list of adjudications in bankruptcy in Friday's *London Gazette*, the name appears of George Highton, of Klea-avenue, Clapham Common, S.W., late North Side, Clapham Common, S.W., and Badford, architect and surveyor.

## THE BUILDING TRADES EXHIBITION.

THE Building Trades Exhibition at the Royal Agricultural Hall will open on Wednesday next, April 26th, and remain open till Saturday, May 6th.

The Exhibition will be opened at 12 noon on Wednesday by Professor Aitchison, R.A., President of the Royal Institute of British Architects, supported by the Duke of Westminster, K.G., Lord Welby, G.C.B. (Chairman London County Council), Sir Wm. Richmond, R.A., K.C.B., Sir Arthur Blomfield, A.R.A., Sir Arthur Arnold, Sir Alfred Hickman, M.P., Sir Wm. Arrol, M.P., Sir Edwin Galsworthy (Chairman Metropolitan Asylums Board), Sir Alex. Binnie (Engineer L.C.C.), Mr. Robert Vigers (President Surveyors' Institution), Mr. G. H. Fellowes-Prynn (President Architectural Association), Mr. J. W. Swan, F.R.S. (President Institute of Electrical Engineers), Mr. W. H. Preece, C.B., F.R.S. (President Institute of Civil Engineers), Mr. O. Claude Robson, M.Inst.C.E. (President Incorporated Association of Municipal and County Engineers), Mr. Alfred Waterhouse, R.A., Mr. T. Blashill (late Architect L.C.C.), Mr. G. F. Bodley, A.R.A., Mr. Chas. Barry, F.S.A., Mr. T. J. Bailey (Architect L.S.B.), Mr. W. Goscombe John, A.R.A., and the leading architects in London and the provinces.

Arrangements have been made for visits on different days from the following institutions:—The Surveyors' Institution, the Architectural Association, the Society of Architects, the Institute of Builders, the Municipal and County Engineers, and the Sanitary Inspectors' Association.

The General Section will be found in the Great Hall, the Electrical Section in the Minor Hall (adjoining main hall), and the Smoke-Abatement Section in King Edward's Hall, leading from the arcade. The committee of the Coal-Smoke Abatement Society offer a gold, silver, and bronze medal, together with certificates of merit, for the best domestic appliances for abating the smoke nuisance. As a whole, the Exhibition promises to be the best and most comprehensive ever held—even under Mr. Greville Montgomery's able management.

## CHIPS.

Mr. G. W. Willcocks, Local Government Board inspector, held an inquiry at Southgate on the 13th inst. into the application of the urban district council for sanction to borrow £3,275 for the erection of 12 workmen's cottages at Winchmore Hill.

Mr. W. A. Ducat, Local Government Board inspector, held an inquiry at Grimsby last week into an application by the town council for power to borrow £43,500 for purposes of electric lighting, and £1,038 for the formation of a new street connecting Guildford-street and Hilda-street.

Mr. E. H. Whitford, of the borough engineer's staff, Plymouth, was successful at the recent examination for Associate Membership of the Institution of Civil Engineers.

The Hambledon Schools, Henley-on-Thames, are being ventilated by means of Shorland's patent exhaust roof ventilators and special inlet panels, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The heating of St. John's Church, Inverness, having been very unsatisfactory for a long time, it was decided to place the matter in the hands of Messrs. John King, Limited, engineers, Liverpool, who recommended that the old apparatus be entirely removed, and that the church be fitted with their latest hot-water heating apparatus, which has been carried out, with the best results.

The town council of Sheffield at their last meeting discussed at some length the alleged jerry-building existing in some parts of the city. The chairman of the Highways Committee admitted that their department was very much understaffed in the number of building inspectors, and that certain proposals would shortly be brought before the council for increasing the staff. In the course of the discussion it was mentioned that during 1898 plans were approved for 3,650 new houses, as against 1,906 plans submitted in the preceding twelve months.

At a large and representative meeting of the master builders of Gateshead, held on Friday, in Mr. Morris's Hall, Cuthbert's-place, it was unanimously agreed to form an association, to be named "The Gateshead and District Master Builders' Association." The required officers, together with a strong committee, were duly elected. It was unanimously decided to continue to resist the demand made by the labourers for an advance.

## NATURAL VENTILATION.

IN a paper on "Hospital Construction," read by Dr. John W. Hayward before the Liverpool Architectural Society, the author deals with the subject of ventilation in a reasonable and natural manner. The author pleads for the free admission of fresh air without draught into the wards of hospitals, and goes on to speak of the removal of the foul air. Open windows may be relied upon to produce the change of air in summer time, and in winter the fire, when burning, draws off a large volume of air; though often this withdrawal is mainly from below the patient, whilst the foul air above him is not touched. To prevent this the firegrates should be supplied from independent sources, and by flues from the fresh-air chambers direct. In spring and autumn these sources of air replenishment fail: the air is too cold to be admitted by open windows, while the fires are not always wanted. The required abstraction of the foul air is then not possible by either of these means. Dr. Hayward quotes a writer in the "Encyclopædia Britannica," who says: "The foul air should be taken out at the highest part of the ward." These outlets, says the author, "should then be in the wards in or near the ceilings; and the best place for them is by the chimney breast, to lead into flues run up the chimney stack by the side of the smoke flue, as the Government Commissioners point out. There must be a separate flue from each ward; they should lead straight to the outer air, and be capped by a Boyle's abstractor." The author next enumerates the following grave objections to the plan of abstracting the foul air near the floor:—(1) It is opposed to Nature's law of atmospheric pressure, and therefore requires the use of special abstracting power by means of furnaces; (2) by drawing down the foul air it is breathed over again; (3) the fresh air supplied is often forced in overheated or burnt, and so made unhealthy; (4) the long, tortuous flues cannot be kept clean, and will become lurking-places for dust and germs.

Downward ventilation is, therefore, quite unsuitable for hospitals, and should never be used where there is infection. The lower air of the ward, the least impure, is drawn away, and is substituted by the upper breathed and impure stratum. The Government Commissioners also strongly object to the method of low ventilation. The heated air which passes upwards (naturally) should pass away, and they recommend exits should be provided for the spent air near the ceiling.

Referring to the position of fresh-air outlets, Dr. Hayward thinks the best way is that the fresh air be let in through the basement, and allowed to pass up through gratings in the corridor floors along the sides of the whole length of them, and then be let into the wards by special openings through the wall or by the doorway. With regard to the foul-air outlets, the writer says: "The mouths of the flues in the ward ceilings should be provided with valves as a safety against adverse circumstances, and their terminal ends outside should be protected by Boyle's air-pump ventilators, which, as well as the last length of the outlet flue, must have an area equal to only 4 in. square for each single-bed ward, and must reach somewhat higher than the smoke-flues." These are the principles upon which all wards should be ventilated, and Dr. Hayward has shown clearly the advantages of natural ventilation as against the system of downward ventilation which has been advocated by some experts on the Continent and in America and England. Where infectious diseases are treated, the danger of rebreathing the vitiated and warmed air is a very serious objection. Dr. Hayward proceeds to show that by natural ventilation the air can be controlled and regulated in the average of twenty minutes, and it can also be so warmed as not to be felt as a draught. He does this very easily by referring to the laws of atmospheric pressure created by the difference between the outer heavier and the inner warmer and lighter air, which causes a current in a flue of 8 ft. per second, and this speed can be increased by the vacuum produced by Boyle's abstractors. With properly-proportioned inlets and outlets, the atmospheric pressure is sufficient to carry on the necessary change of air with comfort and without draught.

The village parish church of St. Dennis, Cornwall, was reopened on the 6th inst., after restoration from plans by Messrs. Cowell and Cowell, of Plymouth.

## OBITUARY.

The death took place, on Monday week, at Bournemouth, of Mr. D. P. FORDHAM, a member of the firm of architects Messrs. Douglas and Fordham, Abbey-square, Chester. The deceased, who was a draughtsman of exceptional ability, was a native of Essex, and received his professional training in York. On coming to Chester to extend his experience, he was engaged by Mr. John Douglas, was subsequently taken by that gentleman into partnership, and remained a member of that firm until about eighteen months ago, when he was overtaken by a lung affection, which necessitated his removal to a milder climate. He went to Bournemouth, but there succumbed to the disease. He was about 55 years of age, had never married, and his only survivor in the family is a sister. Mr. Fordham never took any part in public affairs, and the only professional local body with which he was connected was the Chester Archaeological Society.

## CHIPS.

Mr. Walter Emden, J.P., L.C.C. (President of the Society of Architects) has been appointed one of the committee in connection with the forthcoming Glasgow Exhibition.

The annual meeting of the Iron and Steel Institute will be held at the Institution of Civil Engineers, Great George-street, Westminster, on Thursday and Friday, the 4th and 5th May. The inaugural address will be delivered on the Thursday by Sir William Roberts Austen, who will also preside at the annual dinner of the institute to be held on the evening of that day at the Hotel Cecil.

St. Marychurch has hitherto had its drainage system laid in curved rather than straight lines. In response to communications from the Local Government Board, and acting under the advice of Mr. R. Hansford Worth, C.E., of Plymouth, the system is to be remodelled on modern principles at an estimated cost of £7,700. To inquire into the merits of the scheme Colonel Hepper, D.S.O., R.E., will sit at the town-hall on Thursday next, the 27th inst.

The urban district council of Nunsaton decided last week to purchase 60 acres of land at Hartshill, at £100 per acre, as a site for new sewage outfall works.

A memorial window to the late Major-General Anderson, C.B., has just been completed in the south aisle of St. Cuthbert's Church, Edinburgh. The window is a large one, situated in the upper tier. Conforming to the general selection of subjects for the series of windows, this window contains illustrations from the life of St. John. The principal group represents John and Mary returning from the Crucifixion. Below is a smaller group of St. John recognising the risen Lord as He appeared to him and St. Peter at the Sea of Tiberias. The accessories of the design are in Renaissance style suiting the church.

A new post-office in Fore-street, Ivybridge, was opened last week. Mr. Gilbert Sincok, of that town, was the architect, and Messrs. Daniel and Yabsley, also of Ivybridge, were the contractors.

Messrs. Beaven and Sons, of 35 and 36, Westgate-street, Gloucester, have opened a London office and showroom at 27, Victoria-street, Westminster, S.W. The various departments of their business are well represented, and in their showrooms will be found a thoroughly representative selection of all kinds of sanitary, &c., appliances, by the best makers, which will give architects and engineers the advantage of seeing the various specialities together and comparing their respective merits and prices. A staff of first-rate workmen will be kept in London.

The vestry of St. Dunstan in the West have authorised the sale of the western portion of the yard adjoining the church, and facing Fleet-street, for the sum of £4,500 to the directors of the Law Life Assurance Society, who will extend their offices over the site.

The tower and spire of the parish church of Steeple Gidding have been inspected by Messrs. Thompson and Co., Peterborough, and found to be in an exceedingly precarious condition. Mr. Heathcote has undertaken to defray the costs for the purely structural repairs, which will render the building safe. A further sum will be required for general restoration.

The congregation of the West Free Church, Broughty Ferry, are about to erect in Church-street, south of the Church, a new hall, 62 ft. by 34 ft., accommodating 400 people. The plans, which were selected in a limited competition, are by Messrs. James MacLaren and Sons, architects, Dundee.

A statue of the Queen, by Mr. W. H. Thornycroft, R.A., erected by the corporation of Durban to commemorate the Diamond Jubilee, was unveiled on Wednesday by Sir Walter Hely-Hutchinson, the Governor of Natal.

## PROFESSIONAL AND TRADE SOCIETIES.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—The report of the Council for the official year 1898-99, to be submitted to the annual general meeting on Monday week, May 1, states that in the course of the year 25 Fellows have been elected, 31 Associates, one Hon. Fellow, one Hon. Associate, and one Hon. Corr. Member. The numbers in each class of subscribing members stand as follows: Fellows, 612; Associates, 1,003; Hon. Associates, 47. The losses by death to the Institute during the past year have comprised seven Fellows, nine Associates, four Hon. Associates, one Hon. Fellow, one Retired Fellow, and one Hon. Corr. Member, special reference being made to the decease of Professor T. Hayter Lewis and of Charles Garnier, a Royal Gold Medallist of the Institute. Preliminary and Intermediate Examinations were held in June and November, 1898, in London, Birmingham, Bristol, Manchester, and York, and Final Examinations in London. Of the candidates for the Preliminary Examination, 92 were exempted and 170 examined, of whom 104 passed, the remaining 66 being relegated to their studies. In the Intermediate Examination, 124 were examined, 85 passed, and 39 were relegated, and in the Final and Special Examinations 63 were examined; of these 31 passed, 32 being relegated. The Arthur Cates prizes, for the best sets of Testimonies of Study (supplemented by certain specified sheets of drawings) submitted by students for admission to the Final Examinations, have been awarded to Mr. Albert Herbert for the June examination, and to Mr. H. Inigo Triggs for the November examination. The Ashpitel prize has not been awarded this year. The sanction of the Privy Council to the alterations in by-laws 9, 15, 30, and 31 was given at the Council Chamber, Whitehall, on the 19th May. The revised schedule of professional charges, entitled "The Professional Practice as to the Charges of Architects," was finally agreed upon and adopted at a special general meeting of the Institute held on the 27th June. Since the issue of the last annual report the Aberdeen Society of Architects has been admitted to alliance with the Royal Institute. The Council have taken public action with regard to the new Vauxhall Bridge and the London Government Bill. The competitions committee have had several meetings, and action has been taken with regard to the following competitions:—International Fisheries Exhibition, Aberdeen; Glasgow International Exhibition; Royal Institution, Liverpool; Tavistock-road, Plymouth; Fire Station, Bradford; Wolverhampton Workhouse; Godalming Municipal Buildings; Swindon Union Workhouse extension; Grammar School House, Doncaster; Wandsworth and Clapham Union. Special committees of the Institute are at present sitting to consider respectively the following subjects: the holding of the Institute Examinations in the Colonies; proposals by the Association of Technical Institutions that certain certificates of the Science and Art Department should exempt from portions of the Preliminary and Intermediate Examinations; the administration of building by-laws in rural districts. At the request of the Court of Common Council of the City of London, the Council have nominated six architects to send in designs for the new Sessions House, Old Bailey. The Council announce that since the 31st December they have been enabled to invest £1,500 in Tasmanian Government 3½ per cent. stock.

Mr. W. Emerson, for many years past hon. secretary, has been nominated by the council of the Royal Institute of British Architects as the President for the ensuing two years.

The board schools for the Californian district, Ipswich, have just been enlarged from plans by Mr. T. W. Cotman, of that town; Mr. A. Gayford, also of Ipswich, was the builder.

The science and art schools at Helston, built at the sole cost of Mr. J. Passmore Edwards, will be opened by the donor on Thursday, May 18.

The town council of Bodmin have decided to apply to the Local Government Board for sanction to borrow £3,000 for public improvements, including cattle market at Westheath, £1,500; Guildhall alteration, £543; public garden on old brewery site, £550; and purchase of freehold of free library, £200.

Professor Banister Fletcher, F.R.I.B.A., lectures this evening at University Buildings, Dublin, on "Sanitary Building Construction."

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## NOTICE.

Bound copies of Vol. LXXV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXI., XXXII., XXXIII., XXXIV., XXXIX., XL., XLIV., XLV., XLIX., LI., LII., LIV., LV., LX., LXI., LXII., LXIV., LXV., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., and LXXV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

RECEIVED.—J. W. R.—W. B.—S. M. and Co.—M. T.—T. A. and Son.—F. C.—L. H. S.—C. J.

## Correspondence.

RESTORATION WESTMINSTER ABBEY  
W. FRONT.

To the Editor of the BUILDING NEWS

SIR,—I was much interested in your recent review of Mr. Micklethwaite's new book on Westminster Abbey (March 24), and you made a casual remark therein which directed my attention to the work of restoration upon which Mr. Micklethwaite is now engaged as surveyor to the fabric for the Dean and Chapter. I therefore have taken an early occasion, on being in Westminster, to see if I could ascertain on what lines this work is being done, and learn wherein Mr. Micklethwaite's methods in practice might be improvements upon the system of repair adopted by Mr. Pearson, and following him presumably by Mr. G. F. Bodley—a system which Mr. Micklethwaite was among the foremost to condemn, more particularly in the work of reinstatement so well carried out in the west front of Peterborough Cathedral by these two well-known architects. Mr. Micklethwaite has not himself hesitated to use the public Press to advocate his views. Against my modest letter to you he therefore will not object, even though I scarcely expect he will favour me with an explanation. But for all that, the fact—which is self-evident to anyone who will take the trouble to look—remains that Mr. Micklethwaite has put up a 19th-century imitation—an historical forgery of the work of a past age—a brand-new buttress closely imitated from the old work. Mr. Micklethwaite is doing exactly what he condemned others for doing. It is true he is now in office, safe from the strife of tongues. I com-

plain of nothing. I accord him all praise for his devotion to the anti-scrape cause; but I can but think he is decidedly inconsistent. We were told of that a stock-brick plain wall to the north transept the Abbey would have been better than the fraud on Gothic work which Mr. Micklethwaite's predecessor erected in florid masonry, for it was said at least the stock-brick wall would have been an honest piece of 19th century architectural capacity. Now look at the pity of it, for see how Mr. Micklethwaite is slipping away from the virtue which so well befitted him when aspiring to greater responsibilities. I was the better able to judge of the real value of his criticisms on Mr. Pearson's work at Peterborough a few years ago, because I personally examined the building most carefully at that time when the work was in hand by the late Mr. Thompson, under Mr. Irvine as clerk of the works. I do not say that Mr. Micklethwaite is doing his present work of restoration badly, or, indeed, that if the Dean and Chapter would only make me their surveyor I would do it differently. What I want to know, as a humble learner of my craft, is how Mr. Micklethwaite's work differs from, and how he has improved upon, what other architects have done as restorers, and on whose work the Society for the Protection of Ancient Buildings have unreservedly passed condemnation? If there is no difference, then Mr. Micklethwaite need take no notice of my inquiry, which he will perhaps fancy is presumptuous. It may be; but it is pertinent, surely.—I am &c.,  
AN ANTIQUARIAN ARCHITECT.

## THE NEXT PRESIDENT OF THE R.I.B.A.

SIR,—The several correspondents who have followed up Mr. Woodward's letter on this subject in your pages have one and all ignored the fact that by the constitution and by-laws the Council is possessed of the unqualified right to nominate a member for the office of President. They may, or may not, make the best choice, but it is very little use talking so glibly about having a contested election. It is perfectly true that seven subscribing members who shall be Fellows may nominate any member; but, save in very extreme cases, that is a right of really little value, chiefly because no one of high standing and undoubted reputation would, under such circumstances, permit himself to be put forward as a candidate for the office. In the present instance, Mr. William Emerson has been nominated for the Presidentship, and the official list setting forth that fact is already in the hands of the members. Few would care to commence any serious endeavour to upset such a choice which has thus been constitutionally made, and, besides, the nominee is a gentleman among gentlemen, and if hardly an architect among architects, he has done, at any rate, far more architectural work than the present occupant of the chair. For my part, I am disposed to agree with your correspondent, "A Friend of all Three," that Mr. Aston Webb ought to have been selected; but then I am not on the Council, and mere "men in the street" are of little consequence at Conduit-street. The worst of it is, they keep in the street, and do not go to the Institute. The members, unfortunately, as a body, take no interest in its proceedings, and very few indeed comparatively record their votes when the annual ballots take place. At the last ordinary meeting, when the very interesting subject of decoration furnished the subject of two papers, the chairman complained that so few architects took part in the proceedings, while only a moiety of members attended. There were, I noticed, 20 Fellows, 18 Associates, and three Hon. Associates present. The council comprises many admirable names, and it would be considered treason to doubt their good faith as a body. This the writers on this subject last week seem to imply, and therein they make a sad mistake. The list of new names proposed for the council includes Sir John Taylor, K.C.B., and Mr. William Young, the architect of the new War Office. Mr. Blashill appears still, I am glad to see, in the list; but one looks in vain for that of the new Superintending Architect to the London County Council. If your correspondents desire to take more than a languid part in the elections, they should come forward, and combine to improve affairs. Grumbling is of little avail. Some of the best grumblers and critics of the Council in the past are now members of that august body, and their zeal for reforms has grown less cogent, while some appear to enjoy

a comatose tranquillity; but for the greater part they manage to keep one eye open. Partakers in paternal governments are not singular in this respect. Be that as it may, only a popularly-elected President can ever hope to infuse disinterested popularity into any society. Rules, Sir, Rules—we must comply with the rules. By all means, and what then?—I am, &c.,  
A COUNTRY MEMBER.

## ARCHITECTS AND LOCAL AUTHORITIES.

SIR,—Referring to Mr. Worsley's letter in the BUILDING NEWS of the 14th inst., he is, I believe, quite correct in his statement of the facts he refers to; but I venture to think it would be inexpedient in practice for architects to anticipate the sanction of plans by local authorities, as Mr. Worsley seems to suggest, however confident the authors of those plans might feel as to compliance with by-laws. I have seen evidence of this more than once. The uncertainty and irregularity obtaining amongst local authorities in the interpretation and enforcing of by-laws, and even by the same authorities on different occasions, is common experience, and it is often impossible to be sure beforehand what will, and what will not, be sanctioned or required. It is this point which seems most urgently to call for attention with a view to bringing building regulations outside the Metropolitan area into some sort of uniformity and reasonableness, and securing fair, equitable, and sensible administration of those regulations, in order that those concerned may know precisely what will be required, and that such requisitions shall not be unreasonable, and, I would add, shall be drawn up and administered by competent persons.

As an architect, and for two years a member of an urban district council, I have seen both sides of this subject, and my experience of how things are done in this important matter has been interesting, but not reassuring. I am convinced that the present condition of things in regard to it is most unsatisfactory, and is frequently a source of much unnecessary anxiety, annoyance, and loss to those concerned in building under such conditions.—I am, &c.,  
April 19. WM. H. ATKIN BERRY.

## SECRET COMMISSIONS.

SIR,—I note your columns of the 7th inst. contain a letter from "Contractor," replying to mine in the Builder of the 25th ult. If "Contractor" had read my letter without prejudice, he would scarcely have fallen into the error of replying without touching on my chief point—viz. trade discounts on sums provided in contract. These discounts, as all we architects know, are most secretly kept from the public; were they not, a remedy would soon be forthcoming, and builders would have to forego such exorbitant discounts which, to my knowledge, range to anything up to 66 per cent.

How to profit by looking to the dishonesty practised by some of my own profession I fail to see. Undoubtedly, if all architects followed in their steps, it would be profitable to builders whose expectations to realise profits on trade discounts are unlimited, for architects who will degrade themselves by accepting bribes from a builder (which, like all other bribes, are given that some secret and underhand favours may be received) are the ones who cannot check and disallow any illegitimate commissions or trade discounts the builder may obtain.

I have no desire to interfere with discounts on all materials, but provisional sums are so much abused by some builders (as instanced in my last letter), that I contend it is time the building owner knows what he is getting for his money. For instance, a house costing £1,000 will have included, say, £60 for grates and mantels. If the builder orders, he gets 22½ per cent.—viz., £13 10s. If the house or an hotel is costing £30,000, the sum allowed for this item alone would be more like £1,500; this at 22½ per cent. would be £337 10s. for builder—a nice sum to pocket for practically doing nothing. If, as I pointed out, a special clause is given in his contract, he can add 100 per cent. if he wishes before tendering, to which he is entitled; but to obtain his contract by ignoring this clause, and risking the architect to be one of those "Contractor" thinks I might profit by, is nothing less than getting the work under false pretences, and throwing out the more upright competitors.

The good of many contractors is limited to the

amount of profits they make by fair means or foul, and architects who are prepared to put themselves to a little further trouble in their clients' interest to expose these exorbitant discounts, so secretly kept, will always be in the bad graces of some builders; but as for the necessity of having continuously to obtain fresh builders, it is quite the reverse. There are too many straightforward contractors who know only too well the advantages of straightforward dealing by all concerned. Another point to look at is, why a builder can speculate to make it pay, and the public can scarcely build to return a reasonable interest. It is not far to seek, when every article bought bears with it an unknown profit for the builder; and as "Contractor" does not seem to be aware, it will perhaps interest him to know that in many cases the public are already employing labour direct, and buying their goods on discount terms, which is proving a financial success; and there is no doubt this system is likely to extend, as the public are enlightened that these exorbitant secret discounts are added on to the goods they have to pay for.

"Contractor's" experience on the assured profits of architects is evidently very limited, which only tends to show up his utter ignorance in the matter, which, in any case, is no argument for illegitimate means of increasing one's profit, be he architect or builder. Again, I say, if an acknowledged uniform 5 or 10 per cent. were allowed, there would not be the same need of such precautions; but when they range to anything up to 66 per cent. (and probably over), it is time that our commercial practice of "secret commissions" or "trade discounts" is put a check to.—I am, &c.,  
AN ARCHITECT.

#### IRON CONSTRUCTION IN DRAINAGE WORK.

SIR,—Surely Mr. Coleman's table of the sizes of drains for receiving rainwater is incorrect, or else I am slightly mixed. It is usual to provide for the removal of half-an-inch of rainfall from slated roofs per hour, and it is found that the quantity that flows from the roof is four and a half gallons per minute for every 1,000 super.ft. Now, a 6in. pipe with a fall of 1 in 61 will discharge 324 gallons per minute, running at a velocity of 270ft. per minute; therefore, a 6in. pipe seems to be capable of removing the water from an area of 72,000 super.ft., instead of only 5,000, as Mr. Coleman states. The 72,000 is the maximum area, however.—I am, &c.,  
Kirkcaldy. J. FORBES SMITH, A.R.I.B.A.

### Intercommunication.

#### QUESTIONS.

[12228].—**Louvre Chimney-Pots.**—These chimney-pots are now deservedly very popular, and have been in use for a number of years in various forms—terracotta, zinc, or galvanised iron. They do not appear to have been patented. It would be interesting to know who designed, and were the first makers of them?—F. MARRIOTT.

[12229].—**Mastic.**—What materials and proportion of same will make a good hard mastic suitable for pointing round windows, and will the same be suitable for pointing-up fire ranges?—J. RHODES.

#### REPLIES.

[12226].—**Removing Paint.**—Solution of soda, solution of quicklime, equal proportions. Dissolve soda first, add lime; apply a few minutes, washing off with hot water. Afterwards wash with vinegar or other acid to neutralise alkali. Wet with naphtha, when soft, rub surface clean.—REGENT'S PARK.

In our notice last week, first column, p. 507, of the improvements in progress at St. Patrick's Church, Felling, the name of the firm of marble workers who are executing the contract was given as "Tully and Son," instead of Messrs. Emley and Sons, Limited, of Newcastle-on-Tyne.

Business at the Auction Mart, Tokenhouse-yard, was pretty brisk last week, the official returns of sales being £138,930.

At March, Cambs, last week, memorial-stones were laid of a new Primitive Methodist chapel and schoolroom, now being erected from plans by Mr. J. Kerridge, architect, at a cost of a little over £1,000.

It has been decided to give the name "Victoria and Albert Museum" to the new building at South Kensington, the foundation-stone of which will be laid by the Queen on the 17th of May.

### Our Office Table.

THE Dean of St. Paul's backhander is apparently provoking a good many pleasant little rejoinders from objectors to the "improvement" of the cathedral. That of Mr. Hess, of the *Critic*, is, perhaps, the most forcible. Says Mr. Hess:—"Artistic questions are not to be decided by the people who can sign the biggest cheques. Nor can I pin my faith on journalistic criticism. As a matter of fact, I have seen Sir W. B. Richmond's decorations, and personally find them detestable. His 'Eve,' for instance, appears to me merely a white squaw. The Mother of Men does not seem to possess even the one borrowed bone attributed to her in the Book of Genesis. I would defy anyone not an expert to name the subjects of the choir windows. Nor can I understand any sane man hacking out great blocks of Wren's stonework to fill their place with slabs of trashily-painted lath. But I may be wrong. I fully recognise that is only human nature, when one artist gets a really great commission, for his brethren to be keenly alive to the melancholy failure of his attempts to execute it."

On Saturday afternoon Dean Gregory met by appointment at the Deanery the committee designated by the council of the Royal Institute of British Architects to wait upon him with reference to the scheme of decoration now being carried out in St. Paul's Cathedral. The Dean stated to the committee, in the course of the discussion, that the stencil ornament which has been applied to certain architectural features of the building is largely experimental. As the scheme stands at present, it is intended that the drum (the lower portion of the dome) shall be treated in the same manner as the upper part—that is to say, with glass mosaics. Sir William B. Richmond, R.A., under whose direction the mosaic work is being done, is now in Spain with Mr. Somers Clarke, the cathedral surveyor.

A SERIES of tests is being carried out each Wednesday at the testing station of the British Fire Prevention Committee near the Regent's Canal. Among the tests in hand are several with floors and partitions of an ordinary description as allowed by the London Building Act, 1894, including solid timber floors, and floors with various aggregates of concrete, all of which are not subject to any patents or the interests of any special firm. A considerable number of patented floors, patented ceilings, &c., are, however, also under investigation. The tests, which are carried out on scientific lines, but with the principal purposes in view, are conducted by representatives of the executive, the council, and the body of members in rotation, and their reports are circulated bi-weekly.

#### MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—St. Paul's Ecclesiological Society. Visits to St. Vedast, Fosterlane, and SS. Anne and Agnes, Gresham-street. 3 p.m.

MONDAY.—Society of Arts. "Leather Manufacture." Cantor Lecture No. 2, by Prof. Henry R. Procter. 8 p.m.

Institution of Civil Engineers. Annual Meeting. 8 p.m.

WEDNESDAY.—Building Trades Exhibition, Agricultural Hall. Opening Ceremony by Prof. Aitchison, R.A., P.R.I.B.A. 12 noon.

Society of Architects. Annual Dinner, Regent's Hall, St. James's Restaurant. 7 for 7.30 p.m.

Society of Arts. "Coal Supplies," by T. Forster Brown. 8 p.m.

THURSDAY.—Society of Architects. Visit to L.N.W.R. Goods Warehouses, Broad-street, E.C. 3 p.m.; paper on "The Round Towers of Ireland: their Origin, Uses, and Construction," by Anthony Scott, M.S.A., St. James's Hall, Piccadilly. 8 p.m.

Society of Arts. "Judicial Reform in Egypt," by Sir John Scott, K.C.M.G. 4.30 p.m.

FRIDAY.—Architectural Association. "Specifications," by F. W. Macey. 7.30 p.m.

#### THE ARCHITECTURAL ASSOCIATION.

APRIL 28th.—ORDINARY MEETING. 9, Conduit-street, W., 7.30 p.m. Mr. F. W. MACEY on "SPECIFICATIONS."

NOMINATION OF OFFICERS for Session 1899-1900.

APRIL 29th.—VISIT to the CHURCH in Charlebury-grove, Ealing, at 3 p.m., and afterwards to St. SAVIOUR'S CHURCH Grove-road, Ealing.

E. HOWLEY SIM } Hon. Secs.  
G. B. CARVILL }

### The Society of Architects.

Founded 1884. Incorporated 1893.

THE SIXTH ORDINARY MEETING of the Society of Architects for the Session 1898-99 will be held at the Rooms of the Society, at St. James's Hall, Piccadilly, W., on THURSDAY, April 27th, 1899, at Eight p.m., when a Paper will be read by ANTHONY SCOTT, Esq., M.S.A., on "THE ROUND TOWERS OF IRELAND: THEIR ORIGIN, USES, AND CONSTRUCTION"; and the SILVER MEDAL of the Society, awarded to W. A. SCOTT, Esq., will be presented.

ELLIS MARSLAND, Hon. Sec.  
C. MCARTHUR BUTLER, Sec.

### Trade News.

#### WAGES MOVEMENTS.

THREATENED LOCK-OUT IN THE BUILDING TRADES.—The standing committee of the Master Builders' Association of Great Britain met at the Midland Railway Hotel, Derby, on Wednesday, to consider what action should be taken in view of the serious disputes in the building trades. Alderman Houldsworth, of Bradford, presided over a large attendance of delegates from all parts of the country. The general position of affairs was discussed for three hours. At the conclusion it was announced that a resolution had been passed to the effect that it was quite impossible to conduct business with the existing restrictions and disputes on trivial matters. A resolution was also adopted that decisive measures be taken to settle the matters in difference on a permanent basis. It was further resolved that, unless the plasterers agreed to resume work on reasonable conditions at once, a general lock-out of all the men in the building trades be ordered. The resolutions were carried unanimously, and it was agreed to submit them to the council of the association at a meeting to be held in Birmingham on Thursday next week, the 27th inst. In the event of the resolution to lock-out being confirmed, a very large body of men will be affected. It is asserted by the masters that during the first three weeks of the lock-out the funds of the National Association of Operative Plasterers were reduced by about 25 per cent., and this in spite of the fact that, in addition to the special levy, the members paid in during this time about £1,000 in ordinary contributions for sick benefit and superannuation purposes. Some of the members of the association, who have been bound to that body by the anticipation of sick or superannuation benefit, are said to have already recognised that any such prospect is rapidly vanishing. They are consequently leaving the organisation.

THE SKILLED LABOUR MARKET.—The memorandum prepared by the Labour Department states that the improvement in the state of employment reported as having taken place in February has been well maintained during March, and there have been rises of wages affecting a large number of workpeople in the coal-mining, iron and steel, and cotton-spinning industries. In the 123 trade unions making returns, with an aggregate membership of 494,394, 12,222 (or 2.5 per cent.) were reported as unemployed at the end of March, compared with 2.6 per cent. a month before, and 3.1 per cent. in the 116 unions, with a membership of 466,701, from which returns were received for March, 1898, when the figures were still affected to some extent by the late engineering dispute. Employment in the building trades has continued good, though the plasterers have been affected by a dispute. The percentage of unemployed union members among carpenters and plumbers at the end of March was 1.6, compared with 1.5 in February; the percentage for March, 1898, was also 1.6. Nearly all branches of the furnishing trades have continued to improve, and employment is now brisk. The percentage of unemployed union members at the end of March was 1.0, compared with 3.0 per cent. in February and 1.3 in March of last year.

EDINBURGH.—Joiners in Edinburgh to the number of over 1,500 have struck work for an increase of wages of 4d. per hour, from 9d., the present rate.

STALYBRIDGE.—The painters' strike at Stalybridge has been settled, and the men have returned to work. They came out because the employers refused to give them 4d. per hour advance, bringing their wages up to 8 1/2d. The masters were agreeable to pay this advance on July 1, the date fixed by Colonel Eaton, acting as arbitrator for the Ashton painters. This arrangement did not suit the men, and they struck work last week-end. As the result of a joint conference, the workmen have voted and accepted the masters' offer to pay 4d. per hour until July and 4d. after that date.

SUNDERLAND.—An important development has taken place in connection with the strike of bricklayers' labourers at Sunderland. The master builders have decided to give two months' notice to labourers of a reduction from 6 1/2d. to 6d. per hour. The men struck for an advance from 6 1/2d. to 7d. per hour.

## LIST OF COMPETITIONS OPEN.

Arbroath-Infectious Diseases Hospital (35 beds)	£20, £15, £10	W. K. Macdonald, Clerk, Arbroath, Forfarshire	April 24
Frome-Science and Art School	£25, £10	Geo. W. Bradbury, Clerk, Public Offices, Frome	" 29
Ramsgate-Concert Hall, &c., Paragon Gardens, West Cliff	£50, £20, £10	T. G. Taylor, Borough Surveyor, Broad-street, Ramsgate	" 30
Dover-Concert Pavilion for Promenade Pier (limit of cost £3,000; seating capacity 800 to 1,000)	£25	Ardlie Marsh, Secretary, Marine Parade, Dover	May 1
Stockton-on-Tees-Market Hall	£25, £15, £10	The Borough Engineer, Stockton-on-Tees	" 1
Arbroath-Public Shambles	£7, £5, and £3	W. P. Macintosh, Clerk to Commissioners, Arbroath	" 16
Leeds-Market Hall and Shops, Kirkgate Market	£150, £100, £50	The City Engineer, Municipal Buildings, Leeds	June 1
Okehampton-Workhouse and Infirmary (9 inmates)	£50, £25	Geo. L. Fulford, Solicitor and Clerk, Union Office, Okehampton	" 1
Salford-Public Hall, Shops, and Model Cottages on Site of Infantry Barracks	£31 (merged), £20, £11	The Borough Engineer, Salford	" 6
Wakefield-Central Premises	£50, £30, and £20	J. W. Haigh, Sec., Industrial Society, Bank-street, Wakefield	" 30
Harrogate-New Kursaal, &c., at Spa Concert Room (limit £20,000; Assessor)	£150, £100, £75	Samuel Stead, Borough Surveyor, Municipal Offices, Harrogate	July 3
St. Thomas-Boys' School (600 places) and Teachers' Residence	St. Thomas the Apostle School Board	J. Champion, Clerk, St. Thomas, near Exeter	"
Fulham, S.W.-Public Baths	150gs., 75gs., 50gs.	Charles Botterill, A.M.I.C.E., Town Hall, Waltham Green, S.W.	"

### ARCHITECTURE AT THE ROYAL ACADEMY.—I.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THE President of the Royal Institute of British Architects, Professor George Aitchison, R.A., is responsible for the hanging of the drawings shown in the Architectural Gallery at the Royal Academy this year, and, although by far the larger number are executed in pen and ink, it is evident that the President's sense of colour has had no little to do with the ingenious arrangement of the works displayed on the walls. Infinite care has been devoted to the contrivance and fitting-in of a mosaic of comparatively small frames, and by these means some 61 drawings in excess of those hung last year have been got into the available space. One end of the gallery is, with one exception, devoted to coloured studies, and the effect, it must be admitted, is, in general terms, very bright and decorative. On a closer inspection, individual works are found to be so wanting in architectural merit as to leave no room for doubt as to their colour having given an excuse for their selection in the exhibition. The black and white exception on this wall to which we have alluded is the new Radcliffe Library, Oxford (No. 1830), by Mr. T. G. Jackson, R.A., in the post of honour. We confess considerable surprise that one who has done work of more than ordinary merit should be content to produce so exceedingly inconsequential a design for this building, while the drawing is careless and poor to a degree. Is "Architecture a Profession or an Art?" Such work as this surely reduces it to the level of a trade. The poor Gothic building adjoining, of 30 years ago seen in the sketch, at any rate, is picturesque in outline. This new Radcliffe Library will not add to the reputation of the new Royal Academician. Mr. Aston Webb, the new Associate, figures in a corresponding place of honour at the other end of the gallery, with some excellent views of the Britannia Royal Naval College, Dartmouth (1671), also delineated in pen and ink. This vast undertaking, seated on the crest of a hill, is approached by a series of terraced roads, very materially enhancing the importance of its long façade, which has been cleverly studied with this idea. Our readers will have an early opportunity of seeing an illustration of this perspective, and we may then take the opportunity of referring to the design again. It is marked by refinement and dignified simplicity, which is enhanced materially in effect by a skilfully conceived sky-line. Another building of the first magnitude is the great pile in terracotta and brick (1853), which Mr. Alfred Waterhouse, R.A., is building at Holborn Bars for the Prudential Assurance Company, making a grand isolated block, which will extend from Brooke-street to Leather-lane, and northwards from Holborn to Greville-street. A large quadrangle will form an essential contrivance in the centre of this island of offices, and a grand tower-like pavilion, forming the middle feature of the principal front, will distinguish the entrance archway, and give a striking prominence to the whole. The author's drawing is handled in a masterly way, rich in colour, and cleverly aided by the adroit distribution of well sketched-in groups of figures. The style adopted, as will be seen from the accompanying lithographic illustration, is in unison with the original pre-

mises at the corner of Brooke-street, erected by the same architect some twenty years ago. Ample fenestration and a well-defined grouping of parts, while permitting every attention to practical requirements, are here treated with dignity and broadness, making a building entirely in accord with a contemporary sense of fitness.

Of church work this year there are comparatively few notable specimens. Among these the foremost place is taken naturally enough by Mr. G. F. Bodley, A.R.A., who sends a water-colour by Mr. Brewer, in his best manner, of St. John's Church, at Cowley, near Oxford, showing a typical English interior with a florid rood-screen and loft over, in true Ecclesiastical form, with a rich crucifix to match; following precedent, it is clear, but with a knowledge and artistic sense always in evidence in Mr. Bodley's designs. A good feature is made in a quiet way of the projecting organ-case over the choir. The roof has a pointed barrel vault in timber, elaborated in colour and divided into bays by stone arches, which span the nave at intervals and mark off the chancel. The building is constructed of a warm-coloured stone, which gives a key for the painted decorations.

Sir Arthur Blomfield, A.R.A., is not represented, neither is Mr. Norman Shaw, R.A., whose continued illness since January, we regret to say, still causes much anxiety, though we have had an assurance from him this week which justifies the cordial expression of our hope that an improvement may be now recorded.

Professor Aitchison's diploma drawing, deposited on his election as an Academician, furnishes an elevation of the Royal Exchange Assurance Office in Pall Mall, S.W. (1608), a building which has been erected some years, and is distinguished by careful detail and many windows, inevitable in a narrow street frontage in London, where much light is an absolute necessity.

Turning now to the work contributed by outsiders, we notice with pleasure Mr. W. D. Caröe's designs for the Archbishop's Palace at Canterbury, now building at the corner of the cloisters for Dr. Temple. The drawings by Mr. Raffles Davison illustrate the group of buildings in capital style, and show how ingeniously the architect has combined the old fabric with his new work of extension and adaptation. The whole groups remarkably well with the Cathedral. The low, large square tower of the Palace in no way attempts any competition with the church. Any such endeavour would, of course, be absurd; but Mr. Caröe, well understanding this, has also realised the fitness of a simple and somewhat depressed outline, acknowledging the surroundings and relative values without allowing the sense of smallness to mar his work. Below the elaborated chapel, in Late Gothic, is an examination hall, and next to this a picturesque study prettily planned. This is the best piece of work yet associated with the name of the present architect to the Ecclesiastical Commissioners. He shows several other designs in the present gathering; but they are relatively of minor importance. Another important exhibit occupying a distinguished position is the New Union Church and Institute at Brighton, to be built on the site of the late Paxton Hood's Chapel in Queen's-square. A greater contrast architecturally to the Canterbury Palace, just described, could not be named, and the difference is almost as great between the present Gothic chapel at Brighton and its intended substitute. Mr. John W. Simpson is the architect, and we congratulate him on his work. The scheme comprises a vast auditorium domed in the centre, and having three shallow transepts or apses. These will be fitted with galleries, the rostrum being located on the flat side of the trefoil plan. Two cupola towers will flank the dome on the side of the building fronting

Queen's-square, the Institute extending beyond up the hill. At the corner of the site, which is V-shaped, will be placed the rooms known as church parlours. Brighton has long been famous for its ecclesiastical buildings, and, at last, when Mr. Simpson has built this great pile in Queen's-square, the Nonconformists will be possessed of a meeting-house of uncommonly fine proportions and excellence of design.

Mr. John Belcher is very strongly represented in the present Academy. His Colchester Town Hall will be a very interesting building. A beautiful model of the belfry-tower stands in the gallery, showing how much he has improved the original design, and, moreover, it exhibits the value of good sculpture in conjunction with good building. A fine detail of the main front of this same Town Hall (1722) deserves close examination, for the detail is, in many ways, very excellent. Among our illustrations to-day is Mr. Belcher's "Main Staircase for the Guildhall, Cambridge" (1869), drawn in pure outline, in which the figure frieze makes a notable feature. We shall refer to some other works by the same contributor later on. Hard by the one just named, strange to relate, is an old competitive design, submitted in 1857, for the new War Office, by Mr. Henry B. Garling. We suppose it was thought somewhat interesting on account of the design by Mr. Wm. Young now being before Parliament; but, whatever its interest may be, we can only realise our thankfulness that this design was not carried out. If this result is admitted, possibly the place accorded on the line at the Academy for this big perspective is justified.

Among the buildings of contemporary interest to be seen in the present gallery is Mr. Mountford's clever design for the new States Hall, Guernsey, won quite recently in competition, and illustrated by us last week. The interior of the "Salle d'Attente" (1728) is boldly shown in a way befitting the handsome scale of Classic work adopted. Externally the perspective is disappointing, and the tower seems open to improvement, the division of its parts at present being too nearly equal.

The New Town Hall, Henley-on-Thames, by Mr. Henry T. Hare, is another boldly conceived work spiritedly designed without smallness or littleness of idea (1763), and next above this municipal building on the line is the Passmore Edwards Public Library at Acton, now in course of erection, by Mr. Maurice B. Adams, in red brick and stone. Messrs. Ernest George and Yeates show three bridges this year, two in timber (1635) and one in stone, the latter at North Myms (1749), all excellent and charmingly drawn by Mr. George, who is one of the few architects who is capable of making an artistic drawing of his own work. Mr. Leonard Stokes does excellent work, and we like the Convent at Colney, which he is building in conjunction with Mr. G. T. Hine, here shown by a good pen drawing (1723). Mr. E. Newton's house at Burley-in-Wharfedale is too near the sky to be seen (1731); but we have no doubt as to its merits. Lack of space prevents our naming many things worthy of note, and among these is Mr. H. Wilson's pastel study of a scheme in which he is associated with Messrs. C. W. Whall and Louis Davis in the elaboration of the Lady Chapel of Holy Trinity Church, Chelsea (1743). It is a cartoon of big size, of dashing ability, florid in idea, and rich in form and colour. The names of Mr. Wilson and Mr. Whall are a guarantee of excellence; but for all that the building can never look like this highly-conventional and very misleading drawing. Mr. H. L. Florence shows the new library and museum, at the Freemasons' Hall, with a domed ceiling (1752) now being built. The water-colour perspective does not do the design justice.

We must now conclude our review for to-

day, and in doing so we draw attention to Mr. Edward S. Prior's delightfully-made model for a stone-built cruciform house (1874), with an inner cloister and court open to the sky. This model is excellent, and the design is most interesting—working out a quaint conceit, but making a house of questionable convenience and uncommon expense. The details of this conception bespeak the touch of a true artist. Another model is a good one by Mr. Charles J. Blomfield of a house at Poulton, Fairford, Gloucestershire (1876)—a building of much greater extent and of quiet and home-like design.

The exhibition contains many poor and inconsequential things—some distinctly poor and uninteresting, and some, too, are old chestnuts. On the whole, however, the collection is a good one.

#### PICTURES AT THE ROYAL ACADEMY.—I.

THE absence of the works of several great painters appears still to leave a gap on the walls of Burlington House. Not only Leighton and Millais, but Albert Moore, Calderon, Marks, and Burgess are conspicuous by their absence, and they all sent subject pictures of note. We look in vain at the great centres of interest in the leading galleries, though these are crowded with canvases, some of them of undoubted ability, and displaying technical resource. On the whole, perhaps, we may say there is less of the purely academic and conventional; painters are beginning to catch the spirit of advanced schools, thanks to the protests so persistently made in other quarters, where the older traditions and methods have been abandoned. If there is less reserve and restraint in many of the works, there is, on the other hand, a proportionate desire to go to Nature direct, or to imitate methods that promise a truer personal interpretation of the facts of nature. Landscapes make a large bid on the public this year. On the other hand, subject and figure compositions are few. Circumstances have also robbed the walls of important works. Mr. Stanhope Forbes' great work, illustrating the Fire of London, has occupied a long time, and has gone to the Royal Exchange, so that we unhappily lose his Academy contributions. So, too, it is unfortunate that Mr. Abbey's important picture of "Katharine of Aragon pleading before Henry VIII." was not finished in time; but two lesser works are exhibited. His chief contribution is in the third gallery, and is entitled "Who is Sylvia?—what is she, that all the swains commend her?" the first lines of a song in scene 2 of Act IV. of "The Two Gentlemen of Verona"—a dramatically conceived picture. The fair Sylvia, in white robe with puffed red sleeves, with her attendants behind—some playing mandolines, is the centre figure, whose personality appears to captivate the disguised man who is leaping against the pedestal of columns to the right. We can only say now that the work is solidly painted, the details show accomplishment, and the colour is powerful.

The Diamond Jubilee has not passed without a pictorial record, and Mr. Gow's large, important picture in Gallery II., crowded with figures, of the scene before the western portico of St. Paul's, where the Archbishops of Canterbury and York gave their benediction to Her Majesty as she halted in her Royal progress, is an interesting reminiscence of an event never, perhaps, likely to be witnessed again. As to its artistic merits, we cannot perhaps say all that we might if Mr. Gow had been left to group and mass the multitude. He had simply to record the event and the diverse groups by aid of the camera; but he has shown much skill in grouping the colours and masses so as to

avoid confusion and distraction. No problem can be more difficult for the painter than that of making a picture of a crowd of persons in uniform and gorgeous apparel, ministers of State, officials, ambassadors, ecclesiastics in their embroidered copes and mitres, the white-robed choir rising in tiers, and the only aim he has is to arrange his masses of colour. In this instance Mr. Gow has been successful. The gorgeous colour, chiefly of scarlet, the caparisoned bays of the Queen's carriage, the trappings and the scarlet-clad postillions form a line of strong and brilliant colour along the lower tier of steps of the cathedral. Above this rise in tiers the great crowd of bishops, clergy, and State officials, and the choir in their white robes. John Charlton's picture of the event in Gallery IV., "God Save the Queen," shows a more rapid perspective of the portico and its crowd of spectators. The view faces north, there is a large space devoted to the cavalry and uniforms of the Indian officers in the space before the portico, but the picture is less satisfactory as a whole. The chief interest is centred in the uniforms of the cavalry occupying the area in front of the portico and the houses thronged by spectators on the north side. In Gallery X. the same scene is painted by Gennaro D'Amato, to which we shall refer again. There are a few differences to note in the treatment. The choir appear to have scarlet cassocks under their white surplices, and the grouping is more pleasing than in the last described.

The President's one contribution is not this time a subject such as a Roman or Pompeian interior, or so characteristic a work as he exhibited in the Third Gallery last year, "The Skirt Dance," full of learned research and technique, but a life-size seated portrait of the Hon. Miss Violet Monckton, the accomplished actress, her hands on her lap holding a closed fan. The lady wears a warm cream-coloured satin dress, low cut, and holds a fan, and is seated on a white marble bench, with a black dog at her side. The background is of dark foliage, through the branches of which sky and sea are visible. The landscape background has some faults: it destroys breadth and simplicity, but the painter has overcome this by the dark subdued leafy background of bay, and the low tones employed. The bright blue and green plumage of the birds, one on the lady's shoulder, imparts a vivid note of colour to the work.

Mr. Alma-Tadema's work in Gallery III. is this time an architectural restoration of the Baths of Caracalla, a building which fitly synchronises in time with the subjects he delights to depict of Roman baths and their marble fittings and fair occupants. It is of large size and of upright proportion. It represents a conjectural restoration of the Frigidarium, or cold-water bath, evidence of the details of which exists. The galley-shaped island of marble forming the centre of the swimming-bath is a feature; but this is partially hidden by a large grey column of marble which rises in the foreground. Round the interior are red marble columns which support the arched vault of the bath. In the foreground is a group of three richly-attired ladies—one with a bouquet—gossiping on a couch, while a number of male and female swimmers are disporting themselves, others preparing to indulge in the favourite pastime. The work exhibits learning and archaeological research. Mr. Alma-Tadema has not only restored the architectural interior of this sumptuous edifice, but has re-peopled it with a fashionable crowd of Roman life in its palmiest days. Probably the painter has been helped in his work by the restorations made by French savants, who have brought to light the position of the dressing-rooms, the tepidarium, and the caldarium of this large and splendid structure, which is said to have

accommodated 1,600 bathers. The group of three maidens on a couch of learned design is a picture in itself. Only Mr. Alma-Tadema could have conceived the free and graceful trio of maidens; one sitting on the end of the couch turns her head to chat with a fair lady friend. The harmonious tones of their draperies of light citron green, bluish grey, and drab, look a little weak in contrast with the warm tones and red columns of the background. The white marble tessellated pavement, and the delicate green tint of the water in the bath, full of life and animation, are almost perfect in colour and technique. The architectural scheme may be open to question; an arched vault supported by columns of marble with recessed sides and ends, incloses the swimming-bath, one end of which is used for male swimmers and the other for women bathers. The work is accomplished and full of technique, and is worthy of this painter.

Mr. Leader's deftness as a painter of landscape is undiminished. We see the same open-air brilliance, the same sunset effects. He has not changed his style as many have done;—he sees nature in all its varied effects and realistic detail, and transcribes what he sees faithfully, without any misgiving as to method to make his pictures interpret his own personality, or to produce subtle emotions in the minds of a few, and in this way his landscapes appeal to the popular taste. In the first gallery Mr. Leader exhibits his diploma work, "The Sand Pit, Burrough's Cross" (23) in which we see the bent of his genius. A bank of trees is half bathed in evening sunlight. In Gallery III. we have one of his latest landscapes, in which the same presentment of nature is given. "Evening's Last Glimp" (183) represents the corner of a wooded common. The warm glowing light of the evening sun illumines the upper branches and foliage of a cluster of fir-trees, their cold shadows falling on an undergrowth of bracken or furze. "Where Brook and River Meet" (355), is another very beautiful landscape divided by a brook, with blue hills in the distance; but the colour and tone are very different. Instead of a glowing sunlight, we have morning light, rather cold, perhaps, but brilliant and realistic. There is, perhaps, a want of mass of shadow, too much distributed light. "Summer Eve by Haunted Stream" (508) is delicate in handling of foliage and atmosphere, but the composition is rather disjointed, and appear as islands of detached trees. The reflection in the water, and the mist in the distance, are rendered with consummate skill.

We may now briefly notice a few pictures of note in the first galleries. Seymour Lucas has in "News from the Front," given us an episode from the Civil War. The period chosen is the Cromwellian, and the interior accessories and figures are painted with knowledge and technique. "J. J. Shannon's "Babes in the Wood" (13), is broad and sympathetic. The little girl with her brother are in a thick glade of a birch wood, the grey tones of which are relieved by the autumnal yellow and red leaves which form a background to the solitary figures. J. C. Hook sends several works. "Waders" (14) represents a sandy, rocky beach washed by limpid waves—a very beautiful piece of coast scenery, and the "Waders" resemble herons or storks. John S. Sargent's portrait of "Mrs. Charles Hunter" (18), in large black hat, dressed in a fawn-coloured cape, and with low scarlet-trimmed bodice, is one of the best in the Academy. The painter has succeeded in representing the style and vivacity of his lady sitter. John MacWhirter's large mountain glen, "Dark Loch Coruisk" (19), is grand and forcible. Dark-blue mountains surround a lake bare of all vegetation, "black waves, bare crags" abound, and the painter has sought to realise a stanza of "the

Lord of the Isles." H. H. La Thangue is a contributor of several characteristic pictures. "Cider Apples" (28), a boy emptying a basket of apples, is full of realistic truthfulness, and the handling and colour are strong. In Gallery II. his "Cutting Bracken" (121), a woman and man in an undergrowth, is full of vigour; gleams of sunlight fall on the reapers. There is more here than a simple record of labour: the painter interprets peasant toil in its true sense. His toilers are men and women endowed with zeal for their work, however humble, and he tries to impress us with the dignity of labour. His work is always firm and solid. Hugh G. Riviere paints in a rather decorative manner "The Lonely Life" (53), from Christina Rossetti's poem:—

I, a princess, king-descended, decked with jewels, gilded,  
drest,  
Would rather be a peasant with a baby at her breast,  
For all I shine so like the sun, and am purple like the West.

Peter Graham's grand coast piece, "A Rising Tide," is powerfully painted. Huge dislocated rocks, over and through which the waves and surf beat, form the subject of the picture; but it is the sense of freshness and sea qualities which Mr. Graham imparts to his seapieces that we admire. The seagulls hovering over the rocks, and the fishergirls climbing the rocky pass inland give life to the scene. Ernest A. Waterlow's "La Côte d'Azur" (88) is a large and brilliant landscape. Over Mr. Gow's large Jubilee picture already noticed Arthur J. Nowell has a colossal picture of a well-known and often-painted subject, "Perseus and Andromeda." Perseus, a son of Jupiter, is represented about to kill the sea monster, whose folds are round the chained Andromeda on the rocks. This done, Perseus married her. One legend says Perseus changed the monster into a rock by showing Medusa's head. The composition has merit, and the handling is powerful. John S. Sargent has a portrait of Miss Octavia Hill.

There are painters who have nothing to say: they interpret nature in a literal, mechanical way, often perfectly, and with wonderful technique; but their work leaves no message, or arouses little feeling in the beholder. Others imitate the methods of leaders with more or less devotion and meaning; they catch, as it were, the reflected light of an original exponent, and often produce works of undoubted merit. Thus we have men who have imitated the conceptions and methods of Turner, Constable, Lawson, Corot; or, in these days, of Burne-Jones, the pre-Raphaelite Brotherhood, the French Impressionists, and the hard, flat, mosaic-like handling of the Glasgow school.

H. W. B. Davis, whose charming landscapes with blossoming trees have often attracted attention, sends a very delightful view of the banks of a stream clothed with foliage. Evening light illumines the landscape, the reflection of which in the stream is cleverly handled, and cattle are wending their way along the bank. It is entitled "Going Home." He has also another very fine landscape, "On the Wye," in the next gallery. Mr. Davis is a careful student of nature, and he represents the class of delineator who paints what he sees simply and directly. So also does Mr. Leader. There are others who seek to give us impressions of a more mental kind—effects of sunlight or shadow apart from objects, or some effect of colour or atmosphere to which other details are subordinated. Of this class we find few examples in the Academy.

In Gallery III. one of the chief portraits that will attract attention is Sir W. B. Richmond's graceful presentment of "Miss Muriel Wilson," a society young lady. The painter has, we believe, done justice to the refined classical features and acknowledged charms of this young lady. Seated, she is attired in a delicate grey tinged with salmon, and the grey-window background

revealing a delicate design, sets off the beauty of the figure. Colin Hunter's "Signs of Herring" (138), a grey, misty stretch of water, with birds hovering over disturbed eddies, and his "Kyles of Skye," and the two coast scenes of J. C. Hook, both fresh and green, and sunny. "Grist to the Mill" (232) is the better of the two; but we pause here, to resume our notes of this gallery next week. There is much to call for admiration, a great deal more that is commonplace or mediocre.

#### THE NEW GALLERY.

THE New Gallery opens with a display of pictures of the distinctly modern or advanced school, in which several traditions are followed. Portraiture is strongly represented, and there are some good seascapes and landscapes, but subject pictures are few.

Beginning at the South Room, Herbert Schmalz's portrait of a fair girl in white dress, with blue bow in her light hair, is pleasing. He also sends another portrait (6). W. Llewellyn's "Mrs. Hugh Law" lacks repose; the bright colours of silk blue-lined cloak and the pink are not in harmony. No doubt the painter has produced a characteristic and spontaneous likeness. Somewhat hard and conventional, after the Birmingham school of imitators, is Charles McGere's hilly landscape, "The Lost Sheep" (4), and near it W. J. Hennessy has a large reminiscence of an old Calvados custom, "Le Feu de Joie"—a village green, in the midst of which lads and lassies are indulging in a wild country dance round a bonfire. The landscape and low tones of colour leave something to the imagination.

Reminiscent of the Dutch is William Padgett's "In Flanders," with its windmill and boat on canal, rather crude in treatment and colour. A night effect of "A Street in Dinan, Brittany" (12), by J. Young Hunter, and James Charles's "Evening"—cottages under the shade of large trees, with gleams of sunshine cast over the ground and cattle; and Edgar Wills's "September Sunset" (16) are examples of different renderings. Mr. Edgar Wills is a true exponent of nature. The cattle in the meadow on side of river, and the breadth and atmosphere are handled with much feeling. W. H. Bartlett's glowing coast scene, "Carting Wrack, South Devon" (18)—a rocky headland suffused by a warm sunset—is effective as a study of rock and sea. Charles W. Bartlett is broad in his piece of impressionism, "The Load of Hay." "Saint Geneviève" (24) is a poetically-conceived study of the saint with a lantern in a dark wood. James E. Grace is broader and more convincing in his "Summer Days" than in some of his late work. The tall, delicate foliage of the trees bordering the river, and the atmosphere and bend of the river are attractive. Arnold Helcke, as a painter of seas and rocky coasts, stands high. His "Grandes Rocques, Guernsey," is a fine piece of sea painting; the rolling wave and dark sky are in capital colour, and the subject has a melancholy interest just now. The very brilliant piece of grouping and colour in Miss Flora M. Reid's stall scene, "Vanity, Vanity, all is Vanity" (32), an elderly woman tying on a new cap at an out-of-door stall of odds and ends, is sympathetic in its handling. We admire the technical qualities—the colour of the red stream from the leathern bottle in Mr. C. Perugini's "Ruby Wine." Hung at the end of gallery is a rather decoratively-conceived canvas by George Wetherbee, entitled "Caught," a troop of young girls running on a sandy beach near the sea. In the distance stand huge perpendicular rocks. There is a gracefulness and a sense of motion in the running maidens; the colour is of a light greyish tone. Above this John Finnie sends

one of his solidly painted autumnal landscape harmonies, full of rich tints of russet and gold, "November" (38). Arnold Priestman, in "A Swamp," has a large, lurid landscape of much power. A line of rather stunted trees breaks the expanse of the horizon; the sky is overcast with dark clouds, and the evening shadows cast a gloominess over the scene. The mournful grandeur of night has been realised. Thoroughly "modern" and "open air" in its conception of portraiture is the rather slight and spontaneous work of W. G. Von Glehn (47), a young lady in white dress, with blue sash and large hat, seated in a garden. James Prinsep Beadle's dark and forcible work "The Dawn of Waterloo," a night on the plains, where one dimly discerns the masses of cavalry standing to their horses cloaked, anxiously looking for the dawn of the morrow, is touching in its gloom and pathetic silence. Miss Ethel Walker's "Lamp-light" (31), a young girl seated on a sofa, clad in a dress of soft tones of heliotrope under the light of a lamp, is a pleasing piece of harmony and delicate colour. The light is subdued, and the absence of any strong colour is to be noted—not an easy achievement. We pass by "A Grey Day in the Forest," by Hugh Wilkinson (52), a study of leafless trees, to Hubert Draper's carefully-painted subject, "For Saint Dorothea's Day," a sister in convent dress engaged in filling the altar-vases of the chapel with choice roses. The devoted nun has a peaceful face, and the technical qualities of the picture are strong. Then we have a charming side-face of a girl wearing a large hat with low bodice (59), by F. Markham Skipworth, entitled "Lesbia"; works by James Orrock, "On the Trent" (61); and others by Wilfrid Ball (62), J. Aummonier, and Lady Spence Walpole.

One of the chief centres of interest in the West Room is occupied by a wonderful picture by W. Holman Hunt, "The Miracle of Sacred Fire in the Church of the Sepulchre, Jerusalem," representing the thronged edifice or rotunda in the morning of the Greek Easter Eve. The shrine stands in the centre of the interior, embellished with hanging lamps; around are seen various pilgrims from Russia, Armenia, and other Eastern parts; improvised scenes from The Passion are being enacted; the crowd is full of life and expectation. There are quarrels among the pilgrims and Mohammedans, and what is really a religious rite looks to the spectator one of irreverence. The miracle is at last revealed, the fire is thrust out through windows in the side of the shrine. The miraculous fire is then carried by a priest to the Jaffa gate of the city, thence it is distributed to re-light the altar candles throughout the country. Such is the scene which Mr. Holman Hunt depicts with all his wonted minuteness and in bright and vivid colours. We wonder at the movement of the excited throng, the gorgeous vestments, and the different nationalities. It is painted with all the precision and realistic detail of the great pre-Raphaelite, but is lacking in repose.

J. M. Strudwick's "Falling Leaves" is a charming study of Mediæval sentiment. The pensive-looking maiden of Rossetti type, standing against the carved marble cloister, the paving and openings strewn with sere leaves, is painted in Mr. Strudwick's scholarly style, and is elaborate in its detail of the relief figures on the colonnade.

Miss Anna Alma-Tadema's "The Closing Door" (85) is charmingly finished and delicate in its harmony of colour. The half-agonised look on the lady's face standing near her escritoire, and the hand which is seen closing the door behind her, leaves little to the imagination. The story told is a love disappointment. As for the accessories and the technique, they are unsurpassed. "Beauty Receiving the White Rose from her Father"

(90), by Joseph E. Southall, is quaintly pre-Raphaelite in manner, the drawing and costumes clever. G. F. Watts, R.A., sends three subjects. His best is called "Dedication" (103), and hangs at the end of the gallery. Half-symbolic, half-poetical, the subject chosen represents an angel whose face is buried in her hands before an altar upon which apparently are seen the slaughtered victims of a Jewish offering— young pigeons and turtle-doves. But the painter has a moral, and intends to suggest the cruelty of vanity in sacrificing birds to women's love of fashion? The linen covering of the altar is stained with the blood of these innocent victims. The beauty of the colour is Georgian. His "Peace and Goodwill" (115)—a mother and child asleep—is also charming in its modelling of draperies and harmony of rich tones, if we take exception to the heavy type of figures.

Mrs. Alma Tadema, whose work generally graces this gallery, sends one small study in her dainty style. "The Great Reward" (118) represents a lady at the entrance of her house, and her little girl dressed in a long satin skirt. The mother is holding up a toy figure which the child is anxious to reach. Every detail, the panelled door, the knocker, the dress of mother and child, are delightfully painted with the technique and harmony of pearly hue which this accomplished lady artist can command. Mr. Edward Stott, in "Trees Old and Young" (76) from Keats's "Endymion," shows a change in method and colour; Spenlove - Spenlove's "One Summer's Night" (91) is a large sombre landscape, in deep tones of blue and green, and reflection on rippled stream. C. E. Hallé depicts the legend of May Day Eve in "The Wishing Well," but without the meaning and fervour of a Burne-Jones. Hans Hansen's "Village Fair" (105) is an effective evening street scene; the well-proportioned church tower, whose dark profile is silhouetted against a bright evening sky, and the reflected light on the street, crowded with stalls, are skilfully handled. Amongst portraits we notice Sir William Richmond's Mrs. Marshall, not so successful as his Academy subject. G. F. Watts's portrait of Lord Roberts of Kandahar is scarcely happy. "Mrs. Barrett," by J. W. Godward (132), is a more finished production. The lady is of sallow complexion and auburn hair, clad in close-fitting brown plush dress, resting her arm on a pedestal, on which stands a large bronze bowl. We can at least appreciate the rich harmony of colour and technical qualities; but the drooping hand of the lady is not perfect in drawing. L. Alma Tadema, R.A., sends a portrait of "Mrs. George Lewis and her Daughter" (135), full of careful study, and T. C. Gotch a portrait of a child with her toys, a harmony in white and blue; but we must accord to John S. Sargent, R.A., the merit of expressing character and life in his "Colonel Ian Hamilton" (149). There is nervous energy shown in the thin agile figure of the colonel, which stands out from the grey background.

T. Austen Brown's large, dark, and attractive picture "In a Calf Shed" (150), is strong and robust in its wonderful chiaroscuro. We wonder where the bright golden light comes from which lights up the bundle of straw which the man holds in his prong, the whole shed is in total darkness; but the calves and their attendant are illumined in a marvellous manner. Other subjects include a large centre landscape by J. Coutts Michie (129), a somewhat conventional landscape; "Feeding Pigeons," by Edward H. Fahey; a vigorous Northern sea-coast in strong colour, with trawlers unloading, by Robert W. Allen, "In Shelter"; "Fleeting Beauty," two fair delicate girls playing with soap-bubbles, in light Oriental costume, lacking in composition and robustness; J. Clayton Adams's "Spring" (139), a garden with blossom; MacWhirter's "Birks and Bracken" (145),

and Moffat Lindner's "Evening Glow" (154), with its amber light on rippled water, are noteworthy.

The North Room is largely devoted to portraiture. J. J. Shannon, A.R.A., has a portrait of a lady (170) seated looking at a print, set off by a hanging. There is character and original treatment here; but his other portrait, of Lady Henry Cavendish Bentinck (199), a full-length standing figure in delicate tones of grey, advancing amidst a garden of hollyhocks, is by far the best portrait. The grace and movement of the advancing figure in greyish tea-gown are well given. The painter's daughter is the subject of quite a decorative treatment under the name of "Magnolia" (222), putting us in mind of one of Mr. Gotch's symbolic studies. The fair-haired girl holds a branch of this blossom, and is robed in rich black velvet, trimmed with ermine, over a gown

THE WATER NYMPH.

SAMUEL FRY, Sculptor.

embroidered in tones of this delicate flower of pink and cream. She stands straight and symmetrically before a green curtain, powdered with a pattern of the magnolia petals. "Mrs. Hal Hurst," by Richard Jack, is a full-length standing figure, in a rich dress of black chiffon, embroidered with silver scrollings; technically perfect, but withal, without any of the higher qualities of portraiture.

Miss Lucy Kemp-Welch's "The After-glow" (173), three cart-horses on the brow of a hill, is strong. Next to it, George Spencer Watson has a picture of a "Mother and Child"—a little fellow, quite unclothed, is lying on a snowy-white bed, and his mother turns round from her toilet to look at him. The harmony of white and blue and the light-red curtain are pleasing. The refined and graceful water-colour studies of Miss Mary Gow, "His Lordship the Baby" and "Corinne" (176 and 185), as usual, represent French *élégantes*, clad in gauzy draperies of brilliant delicacy and whiteness.

C. Napier Hemy's "Derelict Boat" (180) in a tempestuous sea is grandly realistic, and we can see the imitation of another painter of rustic labour in Edgar Wills, "Field Pea Pickers." Alfred East, A.R.A.'s, centre landscape, "The Land that Shakespeare Loved," is less strong than the usual work of this painter, but there is atmosphere and repose.

Above J. T. Nettleship has one of his powerfully-painted animal subjects, a stealthily pursuing bear following tracks in the snow. Geo. Harcourt's "Forgiven," a peasant girl kneeling before her young husband at a cottage door, is larger than its importance demands. The Hon. John Collier's personification of "Evil" (236) is not particularly convincing. The crouching young woman, her eyes askance, with scarlet skirt, sitting opposite a fire in a deserted corner of a common, is not exactly the weird, revengeful creature we imagine. "Sea Holly and Sea Lavender," by Alfred Parsons, A.R.A. (237) is a large and bright coast scene, a sandy creek with sand banks, and a wide expanse of low water, a large area covered with the delicate flower. It has a fresh, open-air effect. Mr. Parsons is still a follower of nature, and not given to imitation. The Balcony has a few good water-colours. We notice, in passing, a nice face of a girl supplicating, "De Profundis," and two charmingly-delineated Cornish subjects by Cesare Formili, "Age decked with Nature's Jewels" and "The Fisherman's Possessions, St. Ives," both excellent. A careful and spirited sketch of St. John's College, Oxford, by R. Phené Spiers, and a poetically conceived work by Miss M. Winifride Freeman may be mentioned.

In the Sculpture Gallery are to be seen a few creditable works, among them Mr. Samuel Fry, of Netherhall Gardens, Hampstead, contributes a bronze statuette, "Water Nymph," designed for a fountain, in which there is grace and clever modelling. We give an illustration of this work.

#### THE BUILDING TRADES EXHIBITION.

THE Building Exhibition was opened on Wednesday at the Agricultural Hall under auspicious circumstances.

The opening address was delivered by Professor Aitchison, R.A., the President of the R.I.B.A. It was, unfortunately, impossible to hear Professor Aitchison's remarks, and only one type-written copy appears to have been available for inspection; but, as far as we could gather, the address dealt with building exhibitions and building appliances from the days of the ancient Assyrians downwards, and was characterised by the acumen and research which invariably permeate the genial President's remarks.

A vote of thanks to Professor Aitchison was proposed by Mr. J. W. Swan, F.R.S., and seconded, in his usual business-like and apposite fashion, by Sir Arthur Blomfield, A.R.A. On the whole, the send-off was hardly equal to that of the previous exhibitions under Mr. Greville Montgomery's able management. We miss, too, the interesting exhibitions of craftsmanship, which, under Professor Banister Fletcher's chairmanship, formed so attractive a feature of the last exhibition. Possibly the well-deserved confidence in Mr. Montgomery's management has made the response of manufacturers so overwhelming this year that no room could be spared for the displays of craftsmanship. If so, we have little to say, except that it struck us that the attendance of architects on Wednesday was hardly up to the average of recent years. It goes without saying that the architect is the visitor of all others that the exhibitor at a building exhibition desires to attract. Thanks to the co-operation of the consultative council, in connection with the last two exhibitions, this was secured in a most satisfactory fashion. We hope it may prove to have been similarly made certain on the present occasion, in which case there can be no doubt that the painstaking carefulness and invariable courtesy of its projector will attract still more deserved support in the future. We all know what the Building Exhibitions at the Agricultural Hall had sunk to a few years ago, and no member of the architectural profession would care to visit a show in which vacant spaces were filled by sweetstuff makers and exhibitors of that sort. But we are not so certain that the omission of the very interesting displays of art workmanship, which formed such desirable features of the last two exhibitions, is compensated for by the letting of a few extra square feet of space.

Anyhow, the exhibition is a thoroughly repre-

sentative one. Owing to the somewhat late day in the week on which it was opened, it was impossible for us to deal exhaustively with its contents, and by the time our next issue appears, it will be so near the close of the show, that any additional remarks will be comparatively out of date. We are not gifted with the prescience of some of our contemporaries who managed to publish a readable and, no doubt, critical review of the exhibition before it opened; and all we can do, therefore, this week is to draw attention to some of the principal exhibits, and to supplement our notice next week by a review of those which, owing to no fault of ours, have escaped attention here.

One of the handsomest and most instructive stands is that of Messrs. Doulton, of Lambeth. Second to none, either as regards suitability or novelty of design, or the scope covered, the great Lambeth firm's display is an exhibition in itself. A portion of the stand is allotted to the display of a selection of mantelpieces and fireplaces in glazed faience. We notice in the designs a successful attempt to depart from the more or less stereotyped fashions that have hitherto ruled in this department of ceramics. The forms are commendably simple, and the colour effects quiet and restful. The advantages of glazed fireclay as a material for fireplaces are so obvious that we need not enlarge upon them; the ware is always cleanly and bright, and the radiation of heat so gradual that an equal and healthy temperature is easily maintained. It is evident from the new illustrated list which Messrs. Doulton and Co., Ltd., have recently issued, that as regards really artistic designs and reasonable prices, the firm still holds its pre-eminence. A few words must be devoted to the specimens of wall tiling. The same desire for simplicity of arrangement and artistic balance of colour is here evident. The stoneware tiling is of extreme importance in that it offers a material that can be used in confidence for exterior work, or any position where the ordinary glazed faience may seem to be inadmissible. The absence of a high gloss is the distinguishing characteristic of the "Carrara" stoneware, and this will recommend the material to those who dislike the effect of too glittering a surface. Both salt-glazed stoneware and the "Carrara" enamelled stoneware are in use for constructional work, and several important buildings have been recently erected in which they have been introduced; noticeably, the new Birkbeck Bank (Mr. T. E. Knightly, architect), the entire interior of which is built in "Carrara" stoneware, while the banking-hall, staircase, manager's room, board-room, &c., are in glazed faience. In the section specially reserved for sanitary fittings we notice among other things some strong glazed-ware sinks for hospital use. These are arranged so that the bed-pans can be thoroughly cleaned without being handled in any way. This is done by means of a spray and jet, and the valves for these are worked by means of treadle-action. The sink, in addition, has a flushing rim, so that the whole surface can be cleaned after using. There are other patterns chiefly in glazed ware, but suitable as well for ordinary private use. The baths are very varied in pattern and design, Canopy, French, and Sitz forms being among those exhibited. A noticeable feature is the patent vitreous enamel with which the baths are lined. This enamel is very superior to the old metallic enamel, and has a surface as cleanly and lasting as the earthenware baths, while considerably lower in price and more varied in colour. There is one bath which calls for special attention, which is on the same principle as the canopy arrangement having shower, spray, &c.; but instead of the large hood at the back it is merely a skeleton arrangement with a hanging curtain. Amongst the Lavatories there are some very highly finished examples with marble tops, friezes, &c., and specially shaped basins. In all cases where fitted with standing waste and vulcanite plug, the outlet is made as large as possible so as to allow of their emptying quickly. For supporting these tops either ornamental brackets or highly-finished standards are used, so that the whole space beneath shall be quite open. There is also a selection of decorated earthenware lavatories. Well worthy of special attention are some designs for valves, wastes, &c., for independent baths. The closets are shown fitted as for use. One which is specially noticeable is the siphonic, which gives a good water area and depth of seal, and possesses great advantages in its simplicity and strength of action. Amongst others, there are thick-glazed closets for asylum

use, and also one of the Simplicitas type, decorated. The "Paisley" cistern is fixed with these closets; but it will be seen in some cases the shell, instead of being made in cast iron as usual, is made in highly-decorated pottery. Messrs. Doulton and Co.'s exhibit includes their well-known stoneware pipes of the ordinary type, and with their "self-adjusting" and "composite" joints—both of which forms have been extensively used for main sewerage schemes, and for the drainage of hospitals, &c. The display of white enamelled fireclay is particularly noticeable, and includes lavatories, sinks, &c., which are samples of excellent manufacture and careful design, embodying the most modern sanitary requirements. Staffordshire earthenware, white and cane glazed, is represented by a selection of closets, urinals, &c., while the Staffordshire blue bricks, also visible on the stand, afford further evidence (if any were needed) of the wide range of Doulton's productions in all classes of ceramics.

No better examples of wood block flooring can be seen than those of Messrs. Charteris and Longley, who exhibit numerous samples of their patent "Perfected" system. Examination of the samples will show very clearly the simplicity and ingenuity of this system. The patent "Perfected" blocks, which are grooved along the bottom of each side, have also at each end a rabbeted tongue which fits accurately into the groove of the block lying next to it. By this means every block is securely keyed to its neighbour in a most simple and effective manner, insuring the absolute rigidity of the whole floor. Many different patterns are shown, proving that whether the design chosen be simple or elaborate the same perfect bond is obtained. One is struck by the immense superiority of this system over those which depend for the bonding together of the blocks on loose dowels or similar contrivances, which may only too easily be left out by careless or lazy workmen. The blocks are laid in a special damp-proof mastic, which experience has proved to be the best obtainable, and one that holds the blocks to the substructure even at very high temperatures. It never becomes brittle, and has a natural affinity for all kinds of woods as well as for cement. The greatest care is taken in the selection of the wood used, and its treatment before preparing the "Perfected" blocks. The method of seasoning adopted is the now well-known Shapland's process. After long and careful experiment it has been found that wood treated by this process is in much firmer and brighter condition than if desiccated in the ordinary way, and also (which is very important) that it sustains no injury to its fibre. Having seen that the method and materials used in this system leave nothing to be desired, it only remains to inquire as to manufacture, and to this we find that special attention has been given. By the use of very high class machinery, which they have patented, Messrs. Charteris and Longley turn out their blocks with an accuracy and finish not often met with, and a close inspection of their samples will convince the most exacting that the pre-eminence held by the "Perfected" system is well deserved. To mention seriatim the advantages possessed by floors laid on this system we may say that: They are absolutely rigid, adaptable in blocks of any size, and in any kind of wood, can be laid in a great variety of patterns especially suited to large areas, basements, school corridors, &c., afford a beautifully smooth surface for dancing, &c. They are sanitary, noiseless, damp-proof, rot-proof, and fire resisting, and make special provision for gaining access to hot-water pipes, &c. This last, which is a special feature, merits some description. Both sides of the trench to be covered with flooring are fitted with strong wood curbs on which the perfected blocks rest. These blocks are then securely fastened by long border blocks, which are screwed into the curb on each side. To obtain access to the trench it is only necessary to unscrew the border blocks along one side, and remove the tongued blocks; these are replaced with the same ease, and the floor rendered perfect again.

We have so often recommended Callender's pure bitumen sheeting that it is superfluous here to do more than to direct attention to its exhibit, shown in connection with those of Messrs. John Knowles and Co., the Ketley Brick Co., and Messrs. Outram and Co. Examples of every method of the judicious application of the bitumen sheeting will be found here, both as a lining for existing walls which are damp, and in conjunction with expanded metal, Jhilmil lathing and plastering

on the top. Specimens are also exhibited of its remarkably cheap and effective application for the covering of railway arches, the lining of reservoirs, and for ordinary damp-course purposes. A word or two of praise is the simple due of the admirable damp-resisting solution, made of pure Trinidad asphalt, and sent out in cans ready for use at 7s. 6d. per gallon. We hear nothing but good opinions from all who have used this splendid damp-resister.

Another stand that will rivet the attention of all visitors is that of Aspinall's Enamel, Limited. Here we have a villa decorated entirely with Aspinall's special decorative enamels, Japan, and sanitary washable "Wapicti" distemper. The effect is as admirable as we are assured it is permanent, as is also that of the numerous small articles inside the villa, similarly decorated. It is well to remind architects and builders that the enamels here exhibited have no connection whatever with those sold in the small tins, or supplied to the retail trade, which, admirably suited as they may be to their purpose, are altogether superseded by those shown here for the use of the practical builder and decorator.

Messrs. F. McNeill and Co. show a judiciously-assorted series of their well-known patent felts for exterior roofing and roof lining, as used by H.M. Government for over 50 years; the principal camps and military stations abroad being roofed with their asphalted roofing felt. Their bituminous or inodorous felt for placing under tiles or slates has been adopted by the principal architects and builders throughout the kingdom, and always with good results. Their dry hair felts for sound-deadening and non-conducting of heat and cold, for covering boilers and cisterns to prevent radiation of heat, are as serviceable as they are lasting. Their new patent metal asphalt damp-proof course, a combination of sheet-lead and fibrous asphalt, which they claim is a theoretically perfect damp-proof course material should be carefully inspected. Their fibrous asphalt damp-course material, the handy form of asphalt damp-course which is now largely adopted by many of the leading architects and builders, will impress all with its usefulness. Their patent pipe coverings are among the best non-conductors known. They consist of dry hair, felt, and slag wool made up in a netted form for covering pipes to protect them from frost or to keep in the heat. Their patent slag wool (made by their own special process) is coming largely into use for fireproofing in buildings and sound-deadening, and also for insulating cold-storage rooms and warehouses, and for covering boilers, superheated steam-pipes, &c., to conserve the heat. Their fibrous plaster, a substitute for ordinary plaster, and combination slabs, which are made of fireproof plaster slabs with a backing of patent slag wool, are a handy form for fireproofing and sound-deadening.

Messrs. S. and E. Collier's exhibit, comprehensive and attractive as it is, perhaps after all inadequately represents the enterprise and invention of a firm that makes almost anything in red clay. Their speciality, of course, is their world-famous bright red roofing and vertical tiling, which blends so harmoniously with the green foliage round the thousands of English homes, from the mansion of the peer to the cottage of the peasant, where it has been used. No less renowned are they for their ridging and finials, of which admirable examples are shown. Better specimens of architectural terracotta, too, it would be hard to find; while as for the exhibit of mural and air bricks, chimney-pots, ornamental bricks, pier balls and caps, &c., it is comprehensive enough to enchain the admiration of all who delight in thoroughly well-made and well-designed clay goods.

The British Luxfer Prism Syndicate, Limited, have a display of unparalleled interest in its own line. The chief feature, of course, is the demonstration of their transparent fire-resisting window-glass. A full explanation of the new process of uniting glass by copper electrically deposited in place of the old leaded glazing is given, and sheets of various kinds of glass thus united are exhibited. The Syndicate has had its electro-glass tested by an independent and unprejudiced body, the British Fire-Prevention Committee, and the plates that they have tested, together with the particulars of the heat and water to which they have been subjected, are exhibited. It is, of course, a physical impossibility to show the diffusion of daylight by means of Luxfer prisms in the Hall; but photographs are shown of what has been done in this direction in London,

and samples are on view. Panels of ornamental glass, copper electro-glazed, are also on view. The economic distribution or diffusion of daylight throughout every floor of a building is most efficiently attained, while the manufacture of a fire-resisting window glass is abundantly proved to be an accomplished fact. Of no less interest are the methods shown of improving the illumination behind darkened stained-glass windows, the making of fire-resisting glass lift encasements and staircase encasements, and the making of ornamental glass known as "leaded lights" for door panels, transoms, by the new copper electro-glazing process.

The United Asbestos Company, Ltd., are showing a selection of designs of their "Salamander" decorations for ceilings, walls, friezes, &c. We draw special attention to the ceiling No. 1076, which is in very bold relief. The principal feature of this well-known material is its fireproof qualities. The walls of the stand are decorated in low relief material. The prices are wonderfully low. They range, for the high-relief work, from 4½d. per square foot, and for the low-relief work from 8d. per yard, 21in. wide.

Messrs. Joseph Cliff and Sons have a characteristically fine exhibit of architectural terracotta, glazed bricks (white, coloured, and salt-glazed), and majolica. Their faience mouldings and panels are as good as ever, and so are their terracotta and buff building bricks. Their glazed brick fireplace is worth careful inspection. Tiltman's patent partition bricks, Tiltman's patent continuous scum trough for swimming-baths, also deserve notice. The stand also contains examples of Shoppee's patent dovetailed bricks, Adams's patent dovetail-keyed bricks, "Shepwood" patent ceiling tiles, "Shepwood" patent partition bricks, Hall's patent hanging tiles (9in. by 2½in. face and 6in. by 6in. face), slabbed and loose, the "Grip" patent wall-tile, slabbed and loose, Gregory's patent locking tiles, slabbed and loose, "Imperial" porcelain baths, "Imperial" porcelain bath with glazed rod and feet, white-enamelled and Yorkshire brown salt-glazed sinks in "Housemaid," "Butler," "Kitchen," and other patterns, fireclay closets, and fireclay lavatories of various patterns. A selection will also be found of traps, gullies, and channels in white and salt-glazed wares, chimney-pots, the "Success," &c., together with drain-pipes in graded sizes, Cliff's patent machine-made retorts, furnace lumps, and fire-bricks of various shapes. Manifold as are the forms and uses of the various articles, the high-water mark of excellence of manufacture is indelibly stamped on all alike.

The Anaglypta Co., Ltd., exhibit a large and varied selection of their newest and best productions in extra high, medium, and low reliefs, together with a few very choice and special decorative treatments, for which they have such a wide reputation.

Messrs. Sissons Brothers and Co., Ltd., have a large miniature house decorated inside and outside with Hall's patent distemper. Architects will do well to examine the piece of wood showing the advantage of using the outside quality of the distemper as a priming paint instead of ordinary oil paint to absolutely prevent blistering by sun. We hear continually renewed expressions of satisfaction on the part of all who have used this cheap and effective distemper.

Mr. John P. White has a very fine exhibit of chimneypieces designed by Messrs. C. E. Mallows, H. Wilson, Geo. Jack, C. H. B. Quennell, H. Percy Adams, G. L. Morris, Alf. Cox, Edwin T. Hall, Jas. S. Cooper, and T. W. Hamilton. All are capable of being executed in cheap or costly woods, and the variety in design and the scope as regards cost are as elastic as the level of good taste is uniformly high and the workmanship good.

Another striking collection of chimneypieces is shown by the Bath Cabinet Makers' Co., Ltd. We especially direct attention to the following:—1881, mahogany inlaid chimneypieces; 2177, mahogany inlaid fireplace and overmantel; 2185, mahogany inlaid fireplace and overmantel; 2181, fumigated oak fireplace and overmantel; 2195, fumigated oak fireplace and overmantel, carved; 2196, fumigated oak chimneypiece, plain; 255, fumigated oak chimneypiece, carved. An oak door and numerous examples of carved and inlaid work, repoussé metal panels, grilles, hinge-plates, &c., suitable for interior woodwork, are also shown.

Of all the patent sliding and reversible sash windows we have met with, few equal that shown by Messrs. W. G. and L. England. The sashes slide up and down just as in the ordinary double-

hung window, and are not launched out into space or into collision with one's head, as in the case of some ingenious but utterly impractical concerns of the kind we remember. All the fittings are in view, and the detachment of the sashes for reversion is simple and easy, and the sashes are completely weather-proof when closed. We have seen many inventions of the kind, but have seldom been so favourably impressed as by Messrs. W. G. and L. England's patent.

No labour-saving and risk-avoiding help to builders is making more deserved progress in the favour of contractors than Mr. E. Palmer's wire-supported travelling cradle, which is so simple and so easily worked as to commend itself to all. All who are not familiar with it should examine it, and mark particularly the facility with which it can be moved all over the surface of a front while the men are in it. The large-sized model (12ft. high by 10ft. wide) of house, with working model of travelling cradle and tackle on same scale as the copy-building, and a full-size travelling cradle, completely fitted with all the usual blocks, falls, &c., give the visitor full opportunity of seeing the strength and utility of the apparatus practically tested. At the present time these cradles may be seen working at Messrs. Geo. Trollope and Sons' offices, Halkin-street, W., and Motcombe-street, Belgrave-square; 22, Princes'-gate; No. 1, Hyde Park-gardens; Savoy Hotel, &c.

Messrs. John Knowles and Co. have a splendid selection of tested stoneware pipes on view in "Vitrifine" and other materials, with Hassall's patent joints. The practical architect and builder know the specialities of this firm too well to need particularisation at our hands; but not one will fail to renew his acquaintance therewith to his advantage.

And the same may be said of that veteran firm Messrs. Stiff and Sons, who were the pioneers of the revival in terracotta and clay goods, and who still challenge the world for excellence of manufacture and design. No architect will fail to inspect their admirable selection of hard-fired, straight-lined, sharp-edged terracotta, of various tints, or their admirable exhibit of traps, channels, sinks, closets, lavatories, and fender kerbs in majolica.

Another firm on whom Time's ruthless fingers trace naught but the stamp of long-proved dependence and growing prosperity, is that of Messrs. J. Austin and Sons. Some of us remember what sash-lines were like in the early years of the present century, when Austin's Imperial patent superfine sash-line had not fully insured the universal adoption it afterwards attained, and still deservedly enjoys. There may possibly be some architects and builders unfamiliar with the fact that it is now made for many kindred purposes—for greenhouse sashes, for public-house shutters, blinds, &c.—all alike distinguished by the invariable excellence of the well-known "Anchor" trade mark. They will be amply repaid by a visit to the collection on view.

Recent narrow escapes from fire will keep all architects and builders awake to the merits or demerits of methods of fireproof construction. All, therefore, should renew their acquaintance with one of the most reliable systems, the "Cunah Wright." Walls and floors are effectually protected. As regards economy in space, cost, and time, the Fireproof Partition Syndicate, Ltd., may confidently invite comparison at the hands of all visitors to their well-arranged stand.

Mr. James Woodward will welcome many old and new customers to his capital collection of glazed bricks, manholes, drain-pipes and connections, lavatories, siphonic closets, &c. Many a day's journey may be taken before meeting with a simpler, cheaper, or more efficient and lasting closet than the "Kensington." We have said before that it is next to impossible for this closet to get out of order, while its cost is less than a fifth of that of a high-class valve-closet.

Messrs. F. Jones and Co. show a selection of their well-known patent British-made silicate cotton, or "slag wool," and their fireproof, soundproof and fibrous-plaster slabs. Use and experience have endorsed the many recommendations we have given to both.

Messrs. Wilson and Co. exhibit their well-known "Safety" paving light, with lead frames and level treads for the feet, as used at Hammer-smith Town Hall and in many other places. Fitted either with their improved vertical prismatic reflecting lenses, or their "dioptric" lenses, they will attract attention by their efficiency and extreme reasonableness of price. We may also

draw attention to an ingenious ventilating stove, which insures a constant supply of fresh warm air, and will be found deserving of careful examination.

One of the most complete exhibitions of heating and ventilating is that of Messrs. Matthews and Yates, Ltd. Their "Cyclone" electric fan will at once attract the attention of all interested in mechanical ventilation. Fans on this principle, both open and closed, may be driven by belt, or combined with electric motor, steam-engine, or water-motor.

Messrs. G. Tucker and Son, Loughborough (Stand 119, Row F), have a good collection of red facings, hard weight-carrying pressed brick and sand stocks, and moulded bricks to match; their speciality is a capital hard brick for sewers used in great numbers in London, and adopted for the sewerage works of Cape Town, where many hundreds of thousands have been supplied.

At Stand 10 the Moreau Marble Company, Ltd., exhibit some fine examples of their material, which is a soft, white limestone converted into marble by a chemical process, which does in a few days just what Nature takes centuries to accomplish. The architect will appreciate the greater freedom of design and treatment this material enables him to adopt, untrammelled by the consideration of extras for thickness, and the heavy cost of bold mouldings in natural marbles. The staircase in Sienna Coquillere is an excellent piece of work, and so is the altar screen in Rouge and Sienna Coquillere. Some good chimney-pieces are shown in Rouge and Brocatella Coquillere, and a variety of strings, stiles, panels, and string-courses.

Messrs. William Hampson and Co., Ltd., have a good selection of their well-known and eminently durable stone. It is known geologically as Greenmoor Rock, and has a reputation second to none for steps and landings. For public buildings where the wear is heavy nothing can beat it. It is specified by H.M. Office of Works for Government buildings, and has won the approval of the architect to the London School Board, the engineer of the London and North-Western Railway, and many other eminent architects and civil engineers. Dr. Wallace, the Glasgow City analyst, who has analysed the stone, certified that it contains 92.22 of silica, and 14.8c. ft. in the ton; while Mr. David Kirkaldy tested the stone twice, and found its resistance to thrusting stress 684 tons and 686 tons per square foot respectively.

In the Electrical section, one of the most complete exhibitions of arc lamps and electrical apparatus is that of Messrs. Julius Sax and Co., Ltd., whose long experience in all branches of this industry well warrants notice. We know of no firm whose antecedents better entitle them to the confidence of the architect—either on the ground of efficiency or economy.

The Ratner Safe Co., Ltd., show, in Bay 6, a remarkably unique collection of their unrivalled fire and thief resisting solid bent steel safes, strong-rooms, strongroom doors, plate and jewel safes, and party-wall doors. In the safes, we especially note the doing away with all the ornamental bands, simply attached by screws and rivets, which are obviously sources of weakness, and the legitimate dependence on the inherent strength of the bent plate itself. Hitherto, safes of this description have been costly purchases; but the Ratner Safe Company have solved the problem of absolute security at moderate cost.

The Sanitary Lead Lining and Pipe Bending Co., Ltd., show a remarkably unique series of examples of their specialities. The chief advantages of their method are, simplicity in fixing, the certainty of a perfect joint, practical indestructibility, readiness of replacement, accessibility for painting, immunity from injury by boiling water, or sagging, and economy in cost. A lead-lined system on this principle actually costs less than it would do in 8lb. lead, and is, to say the least, as durable, to say nothing of the other advantages gained.

Whatever else the visitor may fail to see, let him not fail to pay a visit to the stall of the London Stereoscopic and Photographic Co., Ltd. (No. 13 in Bay 13 of the Gallery), the sole photographers to the exhibition. Most will find it absolutely necessary to take away with them some photographic record of some of the objects they more particularly desire to remember, and all will do well to secure some souvenir of their visit, if only for "old acquaintance sake," with the firm that has done so much to make the art of which it is the leading exponent a real adjunct to all purposes of convenience and beauty.

ST. MICHAEL'S CHURCH, BOURNEMOUTH.—PRUDENTIAL ASSURANCE BUILDINGS, HOLBORN BARS.—GRAND STAIRCASE, GUILDHALL, CAMBRIDGE.—NEW PALACE THEATRE, PLYMOUTH.—THE NEW WAR OFFICE.—PROPOSED COUNTY COUNCIL FARM AT GARFORTH.

## Our Illustrations.

## ST. MICHAEL'S CHURCH, BOURNEMOUTH.

This church was built some years ago by Mr. Norman Shaw. It has lately been decided to add a tower, and a design has been made by Mr. J. Oldrid Scott, which has received Mr. Shaw's approval. The position selected is nearly central to the length of the church, the tower standing well forward towards the Poole-road. It will be built of the same materials as the church itself. The approximate cost is about £5,000.

## PRUDENTIAL BUILDINGS, HOLBORN BARS.

This illustration is referred to more particularly in our review of the architectural works exhibited at the Royal Academy this year on page 565. It represents the only exhibit of Mr. Alfred Waterhouse, R.A., the subject being the immense block of Insurance Office buildings, which will form so conspicuous an improvement at Holborn Bars, in continuation of the already existing premises erected by the Prudential Company a few years ago from the designs of the same eminent architect. The key plan given with the view displays the general arrangement of this great scheme now in progress of building. The original drawing is a brilliant water-colour by Mr. Waterhouse himself, our lithographic plate being taken from the outline picture before it was coloured.

## THE GRAND STAIRCASE, GUILDHALL, CAMBRIDGE.

Our first review of the architecture at the Royal Academy, above alluded to, includes a reference to this exceedingly interesting and clever drawing, now on view in the Architectural Gallery at Burlington House. We have not been favoured with any particulars of the work, for which Mr. John Belcher is the architect. Cambridge, so famous for its historic buildings, is already rich in 19th-century architecture, from the designs of several of our foremost men. Mr. Belcher's Guildhall will add to the series in a most conspicuous way, and there can be no doubt as to the cleverness of the design of this grand staircase.

## NEW PALACE THEATRE AND GREAT WESTERN HOTEL, PLYMOUTH.

THESE buildings, situated in Union-street, Plymouth, have been erected from the designs by Messrs. J. T. Wimperis and Arber. The front is in terracotta, by Doulton and Co., of Lambeth, the ground story being in glazed ware. The two-coloured semicircular panels are reproductions of two pictures by Sir Oswald Brierly—namely, "The Spanish Armada at Ferrol" and "The Destruction of the Armada." Internally the theatre accommodates about 2,000 people, and the decoration is eminently suited to the locality. Some particularly fine paintings in the dome and other decorative spaces, by Mr. H. C. Brewer, represent the famous historical events with which Plymouth has been associated, as well as other great naval and military feats and their heroes. Messrs. W. Johnson and Co., of Wandsworth Common, were the contractors.

The box fronts embodying the leading features of the old battle-ships are strikingly original and effective in design, and these, with the arcading at the top of the grand staircase and foyer, has been capitally executed by Messrs. Hooydonk.

## THE WAR OFFICE, WHITEHALL.

THIS drawing shows the façade of Mr. William Young's design for the new War Office, towards the Horse Guards' Parade. By reference to the plan which we gave on March 31, it will be seen that the great quadrangle is reached from the archways in the middle of this front, which faces Inigo Jones's Banqueting Hall. Other illustrations will be found in the last four numbers of the BUILDING NEWS.

## COUNTY COUNCIL FARM AT GARFORTH, YORKSHIRE.

THE accompanying design is for a farmstead at Garforth, near Leeds, for the joint agricultural committee of the East and West Riding County Councils of Yorkshire. Unfortunately, after the tenders were received, it was decided for reasons of economy to temporarily repair the existing buildings on the farm, and the more comprehensive scheme was put off for a while. It will be seen the plan has been arranged to facilitate a convenient and economical working of the buildings. Accommodation is provided for eight horses, twenty cows, six pens of pigs, and six experimental feeding-boxes. The feeding passages, &c., are so arranged that it will be possible to get to all the various departments under cover, and to facilitate the giving of lectures to the agricultural students, for whose benefit to a great extent the County Councils have leased the farm. There are two yards, one of which will be partly and the other altogether covered, the open boarded roofing being adopted. The design has been prepared by Mr. Joseph Shepherdson, of Driffield and Hull, the architect consulted by the joint committee.

## THE SOCIETY OF ARCHITECTS' DINNER.

THE fifteenth annual members' dinner of the Society of Architects was held on Wednesday evening, in the Regent Saloon, St. James's Restaurant. The President, Mr. T. Walter L. Emden, J.P., L.C.C., occupied the chair, the vice-chairs being taken by Mr. Silvanus Trevail, of Truro, and Lieut.-Col. F. Seymour Leslie, R.E., Vice-Presidents, and Mr. H. G. Quartermain, Treasurer, and among the ninety guests present were the Right Hon. E. Carson, Q.C., M.P.; Sir David Evans, K.C.M.G.; Sir Jas. D. Linton; Mr. J. A. Rentoul, Q.C., LL.D., M.P.; the Very Rev. Dean Langton Geo. Vere; Mr. T. L. Corbett, Vice-Chairman of the London County Council; Mr. J. Classon Preston, Master of the Carpenters' Co.; Mr. P. A. McHugh, M.P.; Mr. Andrew Murray, the City Architect; Mr. Charles Welch, the City Librarian; Mr. W. T. Madge; Mr. Joseph Randall, the President of the Institute of Builders; Mr. Ellis Marsland, hon. secretary; Mr. C. McArthur Butler, secretary; Mr. Edgar Furness, solicitor to the Society, &c. A letter of apology was received from the Lord Chancellor, Earl Halsbury, who was prevented at the last moment from attending. Sir David Evans proposed "The Houses of Parliament," and referred to the Bill for the Better Government of London as an all-important and desirable measure. He coupled with the toast the name of the Right Hon. Edward Carson, remarking that Mr. Carson's father was an architect, and while he could not understand why that gentleman did not bring up his son to the practice of his own art, all members must regret that their distinguished guest had not devoted his abilities to their profession instead of to the law. Mr. Carson, in the course of an eloquent and humorous reply, said not only was he proud to be the son of an architect, but originally he was intended to follow that profession himself, and the training he gained in reading a plan and interpreting a specification came in very opportunely, by a curious coincidence, in the first action in which he was briefed—a building case, in which he was able to utilise his technical knowledge in trying to get round the idiosyncrasies of the judge and jurors. The Houses of Parliament met in one of the most magnificent architectural monuments of the present century; but he did not remember many discussions arising as to how they might bring about greater symmetry in the architectural features of London. He was not so certain as Sir David Evans had been

that the London Government Bill was likely to be beneficial, and he was not sure that he fully understood it; but every member was not bound to make a study of every measure, and certainly the omniscient member was not beloved in the House. Mr. J. R. Manning proposed the health of "The Clergy," coupling with it the names of Dean Vere, and the Rev. H. J. Pulley, M.A., who responded, the former very rev. gentleman claiming, in an anecdotal speech, that the Church was the mother of Architecture, and that consequently architects owed very much to the clergy. "The London County Council" was proposed by Mr. Ellis Marsland, who remarked that, although it was rather unpopular, no public body had done more hard work, and had done it so well, as the Council. Mr. Corbett, in responding, referred to the criticism with which the designs for the Vauxhall Bridge had been received, and said that he could only congratulate himself that the tide of criticism had rolled somewhat further down the Thames, and that the County Council for once found itself in the respectable society of the Dean and Chapter of St. Paul's. The toast of the evening, "The Society of Architects, and Architecture," was given by Mr. Rentoul, Q.C., M.P., in a very amusing, if discursive, speech, in the course of which he remarked that architecture was honoured in the fact that our greatest modern delineator of human character had selected an architect as the type of his greatest scoundrel in the person of Mr. Pecksniff. Joking apart, the architect alone among the professions left a lasting and distinctive mark behind him in his buildings. His great disadvantage was that he had to execute sometimes potboilers as he had to work for his living, and was often obliged to carry out buildings in which he had to alter his designs to suit the stupid whims of his clients, a glaring instance of this being the New Law Courts, the best-abused building of modern times, in which Mr. Street was cramped and his plans spoiled by the direct orders of the First Commissioner of Works. He coupled with the toast the name of the President, who in his reply referred to the aims of the society and what it had accomplished. The young Society was started with the purpose of giving life and vitality to the profession. Its first object was to secure the registration of architects, and their consequent recognition by the State; all architects seemed to be agreed on the principle of the Architects' Registration Bill, but hitherto it had been no one's business to push it forward into law. Architects were also at one in urging that there should be in the Metropolis and in every urban and rural district uniform building regulations, wielded by one authority, and for that reason he, for one, did not look with favour on the London Government Bill in its relation to this question. The necessity for fresh legislation to simplify procedure in relation to questions of light and air was urgent, and in this respect the practice of Deans of Guilds Courts as carried out in Scotland afforded a useful precedent. These suggested reforms in registration, uniform building regulations, and light and air questions would involve a large expenditure of labour, time, and money to carry into statutory effect, and in their endeavours to promote these measures, he thought the Society was deserving the support of all members of the profession. Mr. Silvanus Trevail, in proposing "The Arts and Crafts Allied to Architecture," observed that the British Government and our municipalities were deplorably mean and stingy in the amounts allotted for public buildings and their decoration as contrasted with the public spirit displayed in all architectural and decorative matters in the United States, France, and Austria. He coupled with the toast the names of Sir J. D. Linton, who, in his response, referred to the intimate relations that should exist between the architect and decorator, and Mr. Joseph Randall, who spoke as an employer of labour. The remaining toasts were, "The Visitors," given by the President and acknowledged by Mr. J. Classon Preston; and "The Press," proposed by Lt.-Col. F. S. Leslie, R.E., and responded to by Mr. W. T. Madge. Some part-songs were given during the evening.

In the estate market, during the last week, some good business was transacted, notably by the sale of some town houses which hitherto have been a source of such disappointment. The returns, including Messrs. Fox and Bousfield's sales, not officially reported, are £186,763.

## THE SURVEYORS' INSTITUTION.

## ANNUAL COUNTRY VISIT.

AFTER an official reception on the morning of Wednesday, 26th inst., of the members visiting Bristol, by the President of the Institution and the members of the local reception committee, and a welcome to the city by His Worship the Mayor, on behalf of the Corporation of the City, the business of the meeting was commenced by the reading of a paper by Mr. Sturge (past-President) on "Bristol," which, compiled from the many sources of information which were at the disposal of so old a citizen as Mr. Sturge, and reflecting, as it did, so much of his own personal knowledge of the growth of the city over a large number of years, proved to be exceedingly interesting. Bristol, said the author, was one of the most ancient cities in England, but its origin was somewhat obscure. In 1086 it was described in Domesday Book as part of the Royal Manor of Bertone, known to this day as the Hundred of Barton Regis. In Stephen's reign it was described as almost the richest city, receiving merchandise from neighbouring and foreign places, in a fertile part of England, and by situation the most defensible of any city in England. Again in the reign of Henry II. it was referred to as a port full of ships from every part of Europe. Edward III. made it a county of itself, although geographically it is situated in both Gloucester and Somerset. Under Henry VII. John Cabot, a foreign merchant, of Bristol, under letters patent, sailed with a fleet of six ships and discovered Newfoundland. To his honour the "Cabot" Tower\* was erected in 1897. By Henry VIII. it was created a bishop's see, but during this century was united with Gloucester, and again, in 1897, was made a separate bishopric. The city suffered severely during the Civil Wars, being successively occupied by Royalists and Parliamentarians. Macaulay spoke of it as being next in importance at this time to London. In 1685 the hearth-money returns show it to have contained 5,300 houses, inhabited by probably 29,000 persons. At the beginning of the last century many improvements were begun and important houses erected, and in 1832 the boundaries were extended to include Clifton and other parishes, the ancient city of 755 acres being enlarged to 4,879 acres. The municipal boundary now included 11,468 acres, or nearly 18 square miles. The estimated total population was now about 320,000, and it was noticeable that during the past 90 years the population within the same area had increased almost 400 per cent. Mr. Sturge proceeded to give an interesting account of the foreign commerce of Bristol and the construction of the harbour in the early part of the present century, and the purchase of the Dock Estate by the corporation in 1848, the resulting reduction of dues raising the foreign shipping trade from 100,000 tons in 1849 to 800,000 tons in 1898. In the latter year the Customs duties amounted to £1,846,889, an amount only exceeded by the ports of London and Liverpool, and new schemes were now afloat for increasing the dock accommodation. The manufactures of Bristol were also very numerous and extensive, ranging from tobacco and cocoa to boot and shoe factories and chemical works. The places of recreation for the people comprised the downs of Clifton and Durdham of some 400 acres, purchased by the corporation in 1860; Brandon Hill, Eastville Park, Windmill Hill, Redland's Avenue, and many smaller open spaces. The schools and educational establishments were very numerous, and many of them of very ancient foundation. The water supply was, said Mr. Sturge, admirable: the principal proportion being taken from springs at Chewton Mendip, fourteen miles distant, the company's three storage reservoirs now occupying an area of 130 acres, besides a new reservoir now in course of construction at Blagdon, several hundred acres in extent. The gas-lighting and the tramway service on the overhead wire system were mentioned, and reference was made to the coming extension of the latter system. The civil government was, the author said, vested from very ancient times in a corporation, the office of Mayor dating, at least, from the reign of Edward III. Property, which was as a rule held on freehold tenure, or subject to a small quit-rent, had, in the principal business streets, very much risen in value during the last

twenty years, as much as £110 a yard being paid for a corner position, and, in another case, a ground rent of over 30s. a yard per annum.

The second paper was read by the secretary in the absence of the author, Mr. W. M. Acworth (Barrister-at-Law), in which the writer dealt with the railway rates under the title

## "THE RAILWAYS AND THE FARMERS."

The author disclaimed any particular bias in one direction or the other, as he was only a railway shareholder or an agriculturist on an equally microscopic scale; but he wished to view the matter from a perfectly impartial standpoint. To begin with a somewhat startling statement, he concluded that, as a whole, railway rates for the conveyance of agricultural produce in England were not excessive, and compared with similar rates for similar produce under similar conditions in other countries were low rather than high. Figures might be made to prove anything, but this method of argument produced no practical results. But to give one instance. For the sum of 4d. the Great Eastern Railway would bring from any part of the district, say 80 or 100 miles from London, and deliver free at the consumer's door, a box of 20lb., which would hold a considerable number of small items of agricultural produce, worth probably 10s. or 12s. This did not seem excessive, and after deducting cartage would leave only about 1d. to cover the 100 miles railways transport. The often quoted American tariffs for large freights over long distances did not in any way compare with such rates. The Great Eastern rates did not obtain all over the country, but their system was being gradually adopted, and reductions had during the past few years been made of from 10 to even 40 per cent. of the old rates. He believed it might fairly be contended that the rates in England for small consignments of perishable produce were as low as those in force in France, Germany, or America, and having regard to speed and convenience of service, they might be said to be even lower. The fact was that English farmers sent much of their produce in retail quantities and necessarily at retail rates, while foreigners sent wholesale at naturally much lower rates. Again, in England the geographical conditions were different. In America, in France, or in Germany the supplies of the capital were drawn from the farthest corners of the country, while, except in the south-west of England, the produce had rarely to travel more than fifty miles to market. The average percentage of carriage to market on the value of the produce would work out at about 2½ to 5 per cent. for meat, 1½ to 2½ per cent. for butter, and perhaps 7 per cent. for milk. The price of perishable produce in London was often lower than in the country. These figures, he thought, showed that railway rates were not, as was often contended, responsible for agricultural depression. The railways could make out a good case for saying that they do the farmers' carrying at a fair price, but this was not the whole truth. Everyone, farmers included, wanted lower rates, and English farmers might have them if they cared to if they would abandon their antiquated methods. In the Southampton Docks case it was shown that American bacon in train loads was brought to London at 6s. 8d. a ton, while English bacon in parcels of a few hundredweights each was charged 15s.; but the company were able to show that the former rate gave a gross train mile profit of 12s. 6d., while the latter rate only earned gross 5s. per mile. Cost of working averaged 2s. 6d. per mile, so that the net earning on the foreign produce was 10s. per mile, and that on the native produce 2s. 6d. If farmers would co-operate, and take advantage of the much-reduced rates which the companies were always ready to quote, they might reduce the cost of carriage very considerably. Mr. Acworth instanced one case of a town 150 miles from London where the rate was 41s. 8d. for consignments of meat under a ton, while it was only 29s. 2d. for three tons, and yet farmers went on individually sending up small quantities at the higher rate, when a little arrangement would enable them to save some 12s. 6d. per ton. It was the same with corn and dairy produce. Co-operation paid the producer and the carrying company as well.

## LOANS FOR HOUSE PURCHASE.

A paper was read by Mr. Howard Martin (member of Council) on "The Recent Proposals to Enable Working Men to Purchase Their Dwellings by Means of Loans from Local Authorities," in which the author criticised the

various measures which had in late years been brought before Parliament with the object indicated in the title of his paper. It must not, he said, be forgotten that England had become great in the practice of the principles of individualism, and by means of the self-help and energy which it had fostered. Her political freedom and business prosperity had been developed by the energies of individual citizens, unhampered by State interference and unenfeebled by State aid, and it became now important to consider what would be the probable results of driving personal enterprise out of the field by competition on the part of public bodies. There seemed a probability that if any legislation were effected in the immediate future it would be on the lines of Mr. Chamberlain's Bill, which was in certain respects likely to prove the most passable and the most workable. He would therefore deal with this Bill. It provided that a local authority of a county or county borough, or an urban district with a population of 10,000, might advance to a resident a sum sufficient to enable him to buy his house, provided the sum does not exceed four-fifths of the market value, or £240. The advances might be for 30 years, at a rate presumably of 3½ per cent. The repayment was arranged so that if principal and interest were paid off together the rate would come to about 5½ per cent. per annum on the loan. The local authority could only advance to an occupant or intending occupant, and the house can only be held by the borrower (during the term of repayment) subject to punctual payment, to insurance against fire, to his continuing to occupy it, to its being kept in good sanitary condition and repair, and under other restrictions. The borrower might only transfer his interest in the house to the person intending to reside in it. Where the statutory conditions were not complied with the authority might take possession, or on breach of covenant might order a sale by auction. Where the authority took possession they must pay to the owner either an agreed sum or the value of his interest less the amount of interest or advance remaining unpaid. All costs of taking possession were deducted from the payment to the owner, and in the event of an auction proving abortive the authority might take possession without paying anything to the owner. The owner might, under certain conditions, let his house, or reside away from it by special permission of the authority. The expenses of carrying out the measure were to be paid by the ratepayers up to a penny in the pound. The Bill would prevent its powers being utilised for speculation or investment, as it applied to occupiers of the premises only; but in times of business adversity, when cottages stand empty, it would be difficult to find occupying purchasers from the holders of advances driven to seek employment elsewhere. The Bill was entirely permissive, the authority not being bound to lend nor the owner to sell. There could be doubt that, in the abstract, it was desirable to interest as large a proportion of the population as possible in local and national affairs and in the prosperity of the country and of each man's district by making the ownership of the soil as wide as possible; but the conditions of the case were too complicated to be decided on abstract principles, and the matter must be looked at practically. It seemed probable that an act limiting ownership to the actual resident would not be largely applied, for, however desirable such a limitation might be morally, it was a bad investment financially for a man of small means. Outgoings were uncertain, accidents and necessary repairs must be met, and the varying and increasing requirements of sanitary authorities might prove a serious addition to liabilities. Mr. Martin gave a typical instance where the outgoings on an estate of 280 houses in South London, including arrears, amounted to 45 per cent. on the gross rental, and he doubted whether an estate properly repaired and kept up to modern sanitary requirements ever averaged much less. Such outgoings could only be met by small owners setting aside a proportion of income. The income obtainable from small house property was very uncertain, whereas a poor man's investment should be as certain as possible.

In the evening the members dined together at the Grand Hotel in Broad-street, and for the following day (yesterday, Thursday), we hear, as we are going to press, that several successful extensions have been organised, one embracing Bristol, Clifton, and the neighbourhood; a second including Tintern Abbey and Chepstow Castle; and a third Wells and Glastonbury.

\* Designed by Mr. W. V. Gough, of Bristol, and illustrated in the BUILDING NEWS of Sept. 9, 1898.

THE PROPOSED HOLBORN-STRAND  
NEW THOROUGHFARE.

THIS scheme came on Friday, Monday, and Tuesday before the Parliamentary Committee to which the London County Council's Bill has been referred. It is proposed to acquire most of the property on the north side of the Strand between St. Clement Danes and St. Mary-le-Strand, and to form two branch streets, one from St. Clement Danes, and the other from Wellington-street, converging at Stanhope-street, and running thence to Southampton-row. The main thoroughfare and its southern branches are each to be 100ft. in width. Upon the area thus cleared new buildings are to be erected. The cost of the land to be cleared would be nearly four and a half millions sterling; but the Council propose to defray the bulk of the outlay by an elaborate system of betterment and recoupment, without which, it was admitted by the County Council, the scheme could not be undertaken.

On Monday the Right Hon. G. Shaw-Lefevre, who has twice held the post of First Commissioner of Works, was examined before the Select Committee. The scheme would, he said, alter the whole character of the district in question, and would turn it into a most valuable business locality. Sir A. R. Binnie, chief engineer to the County Council, was also examined. He said it was not proposed to interfere with the fabric of St. Clement Danes Church, but only to curtail the disused churchyard. It was originally proposed that the new street from Holborn should run direct into the Strand; but the new scheme, by which there would be crescent arms running east and west into that thoroughfare, had met, he asserted, with general approval.

Other witnesses examined during the week have been Mr. Andrew Young, the valuer to the L.C.C., and formerly surveyor to the London School Board, and Mr. Thomas Blashill, who has just retired from the post of superintending architect to the London County Council. The inquiry will be continued to-day (Friday).

## OBITUARY.

THE death is announced of SIR JOHN MOWBRAY, M.P. for Oxford University, the Father of the House of Commons. Sir John Mowbray was born in Exeter on the 3rd June, 1815, being the only son of the late Robert Stribling Cornish (a builder in Exeter) and Marianne, only child of John Powning, of Hill's Court, Exeter. Sir John's father was, for a great number of years, the Cathedral Surveyor of Exeter, and in latter years resided at Hill's Court, remaining there until the time of his death. This picturesque residence is at present in course of being demolished, and the hand of the speculating builder of the locality is converting the charming grounds in the midst of which it stood into "eligible villa residences." The late Sir John and Lady Mowbray paid a visit to the old home-stead a few months ago, and at the same time went over the extensive studios of Messrs. Harry Hems and Sons, situated almost exactly opposite. He took a great interest in the city of his birth, and quite recently presided at a dinner of the Exeter Grammar School, of which he was the senior "old boy" living. The deceased baronet leaves three sons and three daughters.

## CHIPS.

A large clock has just been erected in the parish church at Peasenhall, Suffolk, which strikes the hours and shows time on a dial 5ft. across. The work has been carried out by John Smith and Sons, Midland Clock Works, Derby.

The Prince of Wales has been pleased to reappoint Mr. Henry L. Florence, vice-president R.I.B.A., the present Grand Superintendent of Works, to that office in Grand Lodge for the ensuing year.

The business of Messrs. Measures Brothers and Co., Ltd., the well-known iron and steel merchants, will be offered to the public in the course of a few days. The share capital will consist of £285,000, divided into 75,000 5½ per cent. preference shares of £1 each and 210,000 ordinary shares of £1 each, and £75,000 4½ per cent. first mortgage debenture stock. The profits, it is understood, are enough to pay 10 per cent. on the ordinary shares, after all expenses are paid. The customers on the firm's books number between 6,000 and 7,000, including the British and Foreign Governments, H.M. Admiralty, the War Office, Post Office, Crown Agents for the Colonies, railway companies, contractors and builders in a large way of business.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

F. WOODWARD. (Neither series have been published separately.)

RECEIVED.—W. G. S. Co.—M. B. R.—L. A. C. and Son.—K. R. R. Co.—S. H.

"BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Clegornie," "Spilark," "Tip."

## Correspondence.

THE NEXT PRESIDENT OF THE  
INSTITUTE.

To the Editor of the BUILDING NEWS.

SIR,—It is a curious fact that all your correspondents on this subject are so impressed by the magnitude of the occasion that they have dreaded to let us know who they really are, and have consequently hidden themselves under the convenient *nom de plume*.

I can now answer the question of "A Friend of All Three" as to "whether my conclusions are accurate," as we have all received the printed "house list," wherein only one name is returned as "President," and that is "William Emerson."

"An Old London City Member" wishes to know why I am advocating Mr. Florence's claims to the presidential chair. The reason is that I think he is the right man as one of the vice-presidents, and that his fellow vice-presidents also think so, knowing that, under the usual custom, they will follow on after Mr. Florence. Their action in permitting Mr. Florence to do the work of the chair, as he has done recently, tends to confirm my opinion.

As for "F.R.I.B.A.," who "thinks it is a pity thus to thrust the private affairs of the R.I.B.A. before outsiders," he is probably one of those gentlemen who regard with awe the self-elected permanent Council, who, year by year, keep more and more to themselves that administration which should be shared by the general body. It is not a "private affair" at all; it is an important matter, which deeply concerns the whole Institute.

I can reiterate positively that the expectations and desire of the general body are that one of the vice-presidents shall always be the nominated for the presidential chair. We all clearly understand (except the Council, or some part of it) that the position of vice-president is the necessary and proximate stepping-stone to the chair, and no society but a Council of the R.I.B.A. would ever dream of departing from it. If Mr. Florence is not the right man now, then let the vice-president who is the right man be nominated, and let it be distinctly set forth by the Council whether or not the position of vice-president carries with it the elevation to the chair in due order.

I will not even yet conclude that Mr. Emerson intends, if he can, to occupy the chair this year. I trust that he will see that he will be an unwelcome interloper, and that it can only have been by the voices of one or two of the happy little coterie at "No. 9" that he has been placed in the position in which he stands in the "house-list."

There was every reason, too, this year, why an architect in practice in London should have filled the chair. Many matters of importance as regards the administration of municipal work, appointments of architects, and general questions affecting professional practice are to the front, and, unfortunately, the Institute has not for some years had the benefit of men in active practice occupying the chair. Mr. Penrose we all love and revere as a dilettant; Professor Aitchison has for many years ceased to worry himself with bricks and mortar, and he may be placed in the same category; and now comes Mr. Emerson, who, so far as I know, is not in active practice in London, however much he may have been in India.

The Council, too, rather suffers from the want of first-class business architects. "Arm-chair" architects are not entirely absent, and that fact, perhaps, accounts for the little real benefit the general body have received at its hands during the last five or six years.

It is, however, of no use for me to "grumble," as "An Antiquarian Architect" puts it. The same little mutual admiration society (the Council) will keep themselves together and re-elect themselves until they become objects of real antiquarian interest, and not till the apathy of the general body is replaced by active interest in the affairs of the Institute will that improvement take place which we all know is needed, but which we appear quite unable to secure.—I am, &c.,

WM. WOODWARD.

13, Southampton-street, Strand, April 25.

IRON CONSTRUCTION IN DRAINAGE  
WORK.

SIR,—Replying to Mr. J. Forbes Smith's letter in the BUILDING NEWS of the 21st inst., permit me to point out that the table of "size of drains receiving rain-water" refers to the size of the "house-sewer" as required by the regulations of the New York Sanitary Authority (Department of Buildings) when such "house-sewer" carries away the rain-water in addition to sewerage or other fouled liquids. This is readily seen by reading the above-mentioned table in conjunction with its context.—I am, &c.,

T. E. COLEMAN.

## Intercommunication.

## QUESTIONS.

[12230].—Kitchen and Laundry Plumbing.—Are there any works that treat of the plumbing arrangements and fixtures of kitchens and laundry work in large establishments like hotels and restaurants? A reply will oblige.—X.

[12231].—Facings of Picked Stocks.—Would a wall faced with picked stocks or best malms cost much more than plain brickwork of the best stocks, flat-pointed? One price-book states the cost of best malms to be 4½d. per foot in addition to the price of slack bricks. Is this a fair charge? Will an experienced builder say whether this extra price applies to London?—COUNTRY.

## REPLIES.

[12224].—Cape Colony.—"Guide to South Africa," by A. S. and G. E. Brown, 1898-9 edition, published by Sampson Low, Marston, and Co. Ltd., Fetter-lane, Fleet-street, E.C., price 2s. 6d., a book of about 500 pages, contains much useful information such as "D. S. M." requires. For an almost complete list of works upon South Africa, see "Catalogue of Books relating to South Africa," compiled by Messrs. Charles A. Fairbridge and John Noble. The Keeper of the Archives, Parliament House, Cape Town (Mr. Leibbrandt), has an even more complete one. He will be glad to show, or be consulted upon, this, upon application.—HARRY HEMS.

## COMPETITIONS.

BURNLEY.—The report has been issued by the assessors, Messrs. Oliver and Leeson, of Newcastle-on-Tyne, on the competitive plans of a new higher grade school proposed to be built by the Burnley School Board, at an estimated cost of £12,000. The first prize of £50 was awarded to Mr. Quarmby, of Burnley; the second of £20 to Mr. F. W. Dixon, Corporation-street, Manchester; while the third, of £10, was divided between Messrs. T. Bell, of Burnley, R. Holt, of Southport, and J. M. Bottomley, Bond-street, Leeds.

LEICESTER.—With regard to the new Wholesale Market Competition at Leicester, Messrs. Leeming and Leeming have been appointed assessors by the Corporation, and as the designs will be delivered on Monday next they will take an early opportunity to inspect them, probably on Wednesday or Thursday next.

ST. PANCRAS BATHS.—At a meeting of the St. Pancras Vestry, on Wednesday, the baths committee submitted the report of Mr. A. Hessel Tiltman, F.R.I.B.A., the assessor appointed to advise the vestry as to the relative merits of the designs for the new baths received from the six architects selected to compete. The assessor stated that, apart from the general disqualification of all the plans upon the point of cost, he was of opinion that the two designs Nos. 1 and 5 best met the requirements as set out in the instructions, and, of the two, he gave the preference to No. 5. Either design would require modification, chiefly in order to reduce the cost to within the £50,000 limit mentioned. After a long discussion, the vestry decided to

adopt design No. 5, and to ask the author to make such modifications in his plans as would bring the cost of the buildings within the £50,000 limit, and to make such other alterations as the vestry might consider to be desirable. It was also resolved to retain Mr. Tiltman for the purpose of advising as to the modifications at a further fee of one hundred guineas. On the envelopes being opened, it was found that the authors were:—No. 1 design, Messrs. Harnor and F. Pinches assessor's estimate of cost, £63,350; No. 2, Messrs. Spalding and Cross, £58,850; No. 3, Mr. Francis J. Smith, £58,340; No. 4, Mr. R. Stephen Ayling, £60,812; No. 5, Mr. Thomas Aldwinckle (selected), £63,550; No. 6, Messrs. E. P. Anson and Son, £62,387.

### Our Office Table.

THE Building Act Committee, in a report presented to the London County Council on Tuesday, refer to the Factory and Workshops Acts, 1891 and 1895, by which the duty is imposed upon the Council of seeing that each London factory or workshop, in which more than forty persons are employed, is provided on the stories above the ground-floor with such means of escape in case of fire for the persons employed therein as can reasonably be required under the circumstances of each case. The powers conferred upon the Council by the Act are exercised by the Building Act Committee, and the latter have prepared a general statement of requirements which they think will be of use in assisting factory owners in making application for the Council's certificate, or in submitting proposals to comply with the requirements laid down. The Committee submit the statement for the approval of the Council, showing the conditions to be observed. But the statement is only to be taken as a general guide or indication, each case being dealt with upon its merits.

ALTHOUGH the Corporation of Liverpool have rejected the plan for the retention of the tower and spire of the recently demolished church of St. George, the local architects have not abandoned hope of preserving so fine a specimen of Early 19th-century work and so lofty a landmark, and on Friday a special meeting, convened by the Liverpool Architectural Society, was held in the Law Library in Castle-street, to consider what steps should be taken. The chair was occupied by Mr. W. E. Willink, the president of the society, and a member of the city council. Letters in favour of preserving the tower were read from the Bishop of Liverpool, Mr. R. D. Radcliffe, hon. secretary of the Historic Society of Lancashire and Cheshire; Mr. Morrison, president of the Liverpool Academy of Fine Arts; Mr. F. V. Burridge, head master of the School of Art; Mr. C. E. Deacon, architect; and Mr. J. T. Watts, artist. On the motion of Professor F. M. Simpson, of University College, seconded by Mr. Robert Fowler, artist, a resolution was unanimously passed stating that, from æsthetic and historical associations, the demolition of the tower would be regrettable, and a second resolution, moved by Mr. Henry Peek, an archaeologist, and supported by Mr. Henry Hartley and Mr. J. H. McGovern, requesting the city council to review their resolution to destroy the tower, was agreed to.

A DISCUSSION is in progress in the Devonshire papers as to the advisability of entirely rebuilding the tower of St. Sidwell's Parish Church, Exeter, in accordance with plans prepared by Mr. E. H. Harbottle, of that city; or whether it would not be better to retain and repair the old fabric, two-thirds of which is in as good condition as it was in four centuries ago. It has been decided to remove the ugly spire added to the tower some seventy years since; but the question of the renovation or reconstruction of the tower itself is still the subject of some heated correspondence in the local Press.

LOVERS of horses who want to see a good lot will do well to be in Battersea Park at 11 a.m. tomorrow morning, where, by the permission of the London County Council, the inspection and parade of the horses, vans, and carts employed by Messrs. Eastwood and Co., Ltd., of Belvedere-road, S.E., will be held. The horses will be drawn up in the northern carriage-drive heading towards Albert Bridge, and after the inspection there will be a procession round the park and round the West-End back to Northumberland-avenue. The prizes offered are numerous. The judging commences at 11 a.m.

### MEETINGS FOR THE ENSUING WEEK.

FRIDAY (TO-DAY).—Building Trades Exhibition, Royal Agricultural Hall, Papers on "Road-Making Materials and Appliances," by H. Percy Boulnois, Engineering Inspector, Local Government Board, and J. Vincent Elsdon, B.Sc. 4 p.m.

SATURDAY (TO-MORROW).—Northern Architectural Association. Excursion to Ryton and Newburn Churches. 2.30 p.m. from Newcastle.

Building Trades Exhibition, Royal Agricultural Hall, Papers on "Road-Making Materials and Appliances," by Sidney Stallard, Surveyor to Maidstone R.D.C., and J. Patten Barber, Surveyor to Islington Vestry. 4 p.m.

MONDAY.—Royal Institute of British Architects. Annual meeting. 8 p.m.

Society of Arts. "Leather Manufacture." Cantor Lecture No. 3. By Professor Henry R. Proctor, F.I.C. 8 p.m.

TUESDAY.—Sanitary Institute. Annual dinner, Whitehall Rooms.

WEDNESDAY.—Society of Arts. "Etheric Telegraphy," by W. H. Preece, C.B., F.R.S. 8 p.m.

THURSDAY.—Iron and Steel Institute. Annual meeting at Institution of Civil Engineers, Great George-street, S.W. 10.30 a.m. Dinner at Hotel Cecil. 7 p.m.

FRIDAY.—Iron and Steel Institute. Annual meeting at Institution of Civil Engineers, Great George-street, S.W. 10.30 a.m.

SATURDAY.—Building Trades Exhibition, Royal Agricultural Hall, Papers on "Road-Making Materials and Appliances," by J. Patten Barber and H. T. Wakelam, County Surveyor of Middlesex. 4 p.m.

Building Trades Exhibition, Royal Agricultural Hall, Papers on "Road-Making Materials and Appliances," by F. Smythe, Surveyor Finchley U.D.C., and J. W. Bradley, Borough Engineer, Wolverhampton. 4 p.m.

### Trade News.

GLASGOW.—Over 1,000 joiners in the Glasgow district went on strike on Friday for a halfpenny advance in wages. The stoppage of work, however, was of short duration, as at a meeting later in the day the members of the Master Wrights' Association affected decided to grant the increase. This brings the rate of wages in the district up to 10d. per hour.

PENRITH.—The painters of Penrith and district, who have been on strike for several weeks, returned to work on Friday. They have obtained 7½d. instead of 7d. an hour, with a week of 52½ hours instead of 54 hours. The plumbers and plasterers are still on strike.

TODMORDEN.—The plasterers' strike is now at an end, the men having resumed work at 7½d. per hour, which is an advance of ½d. per hour. They asked for an advance of 1d. per hour. The code of rules which the employers were asked to sign has not been signed, and is now in abeyance.

WIGAN.—For some time an agitation has been going on amongst the joiners and carpenters of Wigan for an advance in the rate of wages and a reduction in the working hours. Representatives of masters and men have met from time to time, but no basis of agreement could be come to. Eventually it was decided conjointly to ask the President of the Board of Trade to appoint an arbitrator to adjudicate upon the points in dispute. Mr. Ritchie selected Mr. A. A. Hudson, barrister-at-law, of London, and that gentleman recently sat in Wigan and heard representatives from both sides on the question. The arbitrator's award has just been received by the secretaries of the employers and workmen. The latter had asked for an advance of 1d. per hour and a reduction in hours from 53 to 49½. The award gives the men an advance of ½d. per hour, but no reduction in hours. This will bring the wages up to £2 0s. 10d. from £1 18s. 7d.

A bust of Mr. J. Passmore Edwards was unveiled on Thursday last week at the free library, Pittfield-street, Hoxton. The bust is a mark of appreciation by the inhabitants of Shoreditch of Mr. Passmore Edwards' generosity towards the free library and other institutions in the parish.

The spring meeting of the Institution of Mechanical Engineers is being held in their new house, Storey's Gate, St. James's Park. The president, Sir William H. White, delivered his inaugural address last (Thursday) night. This evening a paper will be read by Mr. H. V. Oldham on "Evaporative Condensers," to be followed by a discussion.

## CHIPS.

A new workhouse infirmary was opened at Fal-mouth on Thursday in last week. It contains 40 beds, and has cost £2,100.

Messrs. Mainzer and Co., Limited, 18, Berners-street, W., have been intrusted with the carrying out of the mosaic floors at the New Heath Asylum, Bexley, of which Mr. G. T. Hine is the architect. The same firm have just completed the mosaic and terrazzo floors at the Whittingham Asylum, Lancashire, which has been erected from the designs of Messrs. Simpson and Duckworth, architects, Blackburn.

The Passmore Edwards Convalescent Home for Friendly Societies, Herne Bay, will be opened by the donor on Monday next, on which occasion special trains will run both in the morning and afternoon. The home, which was illustrated in the BUILDING NEWS for Nov. 5, 1897, by a perspective and plans, has been erected on the Beltinge Estate from designs by Mr. A. Saxon Snell, F.R.I.B.A., at a cost of £6,000, and accommodates fifty male patients.

## "SANITAS" DISTEMPER.

A Washable Sanitary Distemper for Whitening and Disinfecting Walls and Ceilings of Passages, Cellars, Stables, Kennels, Sheds, Farm Buildings, Railway Trucks, Horse Boxes, and for General Use.

## AND ENGINEERING JOURNAL.

VOL. LXXVI.—No. 2313.

FRIDAY, MAY 5, 1899.

### BUILDING INVENTION.

TO know the "latest thing" in building, as in everything else, is one of the accomplishments of the architect who desires to keep pace with the ever-increasing list of things necessary for the proper specification of a building. Very vexatious and annoying is the experience of the architect when he discovers that he might have hit upon a better and more approved plan, have constructed his floors and roofs on a more simple and economical system, or have employed a particular kind of flooring, or specified more perfect sanitary fixtures than he has. Yet this sort of experience occurs frequently. The knowledge of the invention, new material, or appliance comes just too late; the building is erected, and the architect finds that he might have done something so much better, or specified a thing that would have given more satisfaction. Invention does not come to all men. Some naturally possess the gift, others appropriate discerningly, the majority simply follow. The man who makes planning a study, and compares results, is more likely to attain his end in the least laborious manner; he is the man who produces the most agreeable elevations and treatments, the best plans. We have many more ways of inventing new plans than our ancestors. Our system of draughtsmanship is more perfect, and we have the advantage of seeing what others have done for the same class of building by means of the professional Press. Yet these advantages have failed to evoke fresh ideas, mainly because we are too contented to accept others' work for our own thought. In nine out of every ten cases an architect finds a plan that so nearly suits him that he does not trouble to think any further, but adopts it. This is what the process of reproduction has done: it has lightened labour and dispensed with thought.

Modern building invention is not only concerned in design and plan, though these will always be the highest. The modern building is made up largely of a variety of industrial products, from the materials of building to the thousand-and-one appliances which modern requirements have called into being. These are to a large extent independent of architecture. The construction of walls and floors has called out the ingenuity of inventors, who have vied in producing methods for securing economy of material, better bond, immunity from dampness, resistance to fire, and other objects. The architect may ignore some of these methods, but they exist nevertheless; concrete wall building, steel framing, and concrete cavity wall-construction claim his attention. In the new Admiralty and other buildings partitions are constructed of wonderful strength and resistance to heavy blows, that are made entirely of cement and breeze, that are much stronger than brick partition work of the same thickness, and which can be finished with plaster or cement, that will hold nails for battens and grounds, and are proof against fire. Or steel uprights with metal lathing for plaster, or to hold sheets of corrugated metal that can be plastered. Again, there are walls constructed of interlocking tiles and bricks with cavities. Though these modes of building walls are not generally used, they have their advantages under certain conditions, and for temporary structures they answer well.

The systems now in use for floor construction show the same ingenuity, and the

architect who specifies for large public buildings is responsible for not informing himself of the respective merits of each system. To say one is as good as another is to reflect on his knowledge, sagacity, or discrimination; he must know each system, to be able to determine which is the best or the most suitable for his purpose. Look, too, at the numberless examples of wood-block flooring in the market, and of which we see one or two good systems at Islington, such as the "Perfected" system, where each block is grooved and keyed to others. An architect would, indeed, be neglectful if he failed to make himself acquainted with each of the many plans before the profession. Imagine, indeed, the floor of any public building laid with ordinary boards on joists, when, at a slight increase of cost, a solid and practically indestructible floor can be laid upon solid steel and concrete.

These and sundry other inventions are being introduced into buildings to a larger extent than ever. It is not too much to say that at least 30 per cent. of our commercial buildings now adopt one or other of the so-called "fire-resisting" floor systems, while all our public buildings have them. As for other appliances, such as sanitary and ventilating contrivances, the numerous new improvements in traps, closets, baths, lavatories and their mechanism, which enterprising firms like that of Messrs. Doulton and others have introduced, the architect cannot afford to despise. The Building Exhibition, such as that now open at Islington, is one of the agencies by which these inventions can be brought to the notice of the profession. In these collections we can examine, take notes, and compare one system with another. The great industries of ironwork, terracotta, ceramics, lighting and glazing, electric lighting very closely ally themselves with architecture. We can hardly enter any new city or metropolitan building which does not possess improved modes of introducing daylight into the interior or basement like the "Luxfer" prism; or ceramic decoration applied to walls where light and cleanliness and decorative effect have to be combined; asbestos, Anaglypta, or some other kind of decoration for ceilings and walls; beautifully and artistically wrought brass or metalwork for electroliers and brackets, and a hundred other improvements in the shape of locks, fastenings, finger-plates. In the pressing duties of his calling, the architect has to take stock of all these details; he cannot afford to escape them, or to ignore them for old methods, without being open to rebuke; and the successful architect of the future will be he who can make an intelligent selection for his particular building without sacrificing the unity and integrity of his design. This no doubt is one of the perplexing problems of modern architecture: How to appropriate without destroying individuality? We have some buildings that are crammed with manufacturing specialities—odds and ends, as if the design were entirely a conglomeration of patented materials and specialities, where the architect's hand in detail is not seen, and where he has allowed himself to be effaced, the result of bewilderment and confusion—a grievous reflection on his ability, an excess that can only be averted by a large knowledge of what is best.

### ARCHITECTURE AT THE ROYAL ACADEMY.—II.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

LAST week we noticed some of the more prominent works exhibited in the Architectural Gallery, and in going round the room we missed several familiar names whose work a few years ago was generally to be seen at Burlington House. Among these absentees not a few are the possessors this year of rejected contributions. We are not really

so much surprised at that as we are to see some of the drawings chosen. Not, however, that this is any new experience, and possibly it may be inevitable. The enigma remains as to why certain things are selected, and the wonder is what canon of art or rule of taste contributed to such results. We have on previous occasions particularised to emphasise our difficulty, and we will do so again. No. 1621 shows a row of small shops at East Grinstead; they are quite devoid of interest; shops of very ordinary type with a first floor over. The only part of the building which is new, seemingly, is a high mansard roof providing another floor—indeed, so bald is the façade that the exhibitor has covered it up almost entirely with white sunblinds or sheets, of which, in fact, the drawing is mainly composed. The coloured chalks employed are intermixed with black, and we do not know why so prominent a place on the gallery wall is thus occupied, for surely such stuff as this is not actually architecture.

We will endeavour to follow round the gallery with the serial numbers so as not to overlook any distinguished example, though this method of reviewing a lot of drawings prevents anything like grouping types of the same class of work together. The Labourers' Cottages, Bromford, by Mr. H. T. Buckland, are too red in colour in the sketch; but the Dutch-like rounded gables are suitably simple. Hillington, Walton-on-Thames, with some quietly-handled bay windows, does justice (1618) to the good taste of Messrs. Niven and Wigglesworth. Messrs. Wimperis and East are ambiguous in the title of their proposed rebuilding of London newspaper offices (1620); but they display a fancy for a red brick curved front, well broken by ample fenestration. Mr. A. N. Prentice has three spacious drawings well hung of the same house, a big place in Suffolk called Cavenham Hall, with broad, massive brick-built chimneys, and the upper part of the fabric plainly rough-cast. There is considerable merit in this building, which is well planned; but the architect seems to have felt afraid of his own attempt at breadth, seeing that a creeper is introduced where it is not wanted for good effect in the drawing of the plain end wall. The actual fault is that this end mural treatment is not really wide enough. The proportion and fitness of the chimney stack forming part of the main building is far better. The silhouette style of these drawings is very emphatic and hard, and it is too conventional to be sympathetic (1624, 1634, and 1684). We shall illustrate the house shortly, and also will give Mr. John W. Simpson's softly-handled etching of his capable School for Ladies at Roedean, near Brighton (1615), one of the largest establishments of its character in England, and certainly among the most picturesque. The design for a Calvary in St. Bartholomew's big stock-brick church at Brighton by Mr. H. Wilson is drawn in charcoal with originality. The altar and choir seatings shown by the same architect last year for the same building have not yet been carried out. Messrs. Lancaster, Stewart, and Rickards show their design for Godalming Town Hall, a capital piece of work, though the cottage windows below along the front hardly harmonise with the monumental treatment introduced in the central part. We like the whole thing far better than the same architects' new Law Courts proposed to be built at Cardiff (1646). The drawing is bold in outline, strangely inadequate in parts, the detail being coarse, and, while aiming at originality, misses the grace of style and refinement. The new Higher Grade Schools and Teachers' Centre, Aston, Birmingham, by Messrs. Crouch and Butler, is a rather important work of its kind, well done. The village buildings (1653) and other Worcestershire domestic work by Messrs. Dawber and

Whitwell are very unassuming and pretty, and similar praise is well deserved by Messrs. Brewill and Baily's house at Aspley Heath, near Bedford, and Cresswell Schools. Their Presbyterian Church, Nottingham, is conspicuous for its plain western tower—so different from the popularly familiar gingerbread Gothic of similar buildings. Mr. E. P. Warren sends a low long village church at Bryanston, Dorset (1658), and Mr. Caröe shows the campanile of St. Mary Gate, Gloucester, as now completed (1675). The competition design by Messrs. Briggs and Wolstenholme for Bootle Fire Brigade Station looks imposing, and of a similar class of work is Newport and Monmouthshire Hospital, by Mr. R. J. Lovel. The new staircase and hall, Warnham Court (1641), a well-studied work by Mr. Arthur C. Blomfield, is clearly shown in pen and ink. Another interior is that of the south hall, Branksee Castle, Dorsetshire, designed to have colour decoration in a vaulted roof by Mr. R. S. Balfour, with refined reserve in quiet tones, rather perhaps scattered in effect (1698). Mr. Christopher W. Whall has an intensely keen appreciation of colour, and there is a thoroughness in his executed glass-work which we much admire. The small drawing of a private chapel window for Douglas Castle, Lanark, does not give a good idea of the real merit of Mr. Whall's work (1702), speaking generally. Mr. Thomas Davison hangs a coloured study in detail of the Trowbridge Technical School entrance bay (1703)—a plain building most capably handled. Mr. Roland W. Paul seems to be doing some good, quiet church work in Dorset and Somerset, showing three specimens. Chard Church, for example, is skilfully added to by him with new chancel and transepts (1787). Holy Trinity Church, Roehampton, is a typical work by Mr. G. H. Fellowes Prynn (1726), shown by an interior illustrating the stone screen of well-shaped florid tracery in front of the choir. Next to it is a new block of premises in Hanover-square by Mr. John Belcher, all in stone, with broad fluted pilasters dividing the upper part of the façade. The lower portion seems wanting in a base, and the superstructure might be described as a trifle commonplace, though this effect serves to set off the more original arrangement of the main fenestration below, with the range of sculptured figures ingeniously introduced over each window, after the manner adopted elsewhere by Mr. Belcher. Mr. Arnold Mitchell has a gabled small house at Rickmansworth, and Mr. C. F. A. Voysey shows some of his rough-cast-coated quaint cottage-like dwellings at Windermere and Oxshott. No. 64, Parliament Street, S.W. (1733), shown by Mr. Alfred Williams, has undoubted boldness, and a degree of play which attracts the passer-by; but we cannot like the polished granite ground-floor story. New College Buildings, shown by an outline elevation, is the latest addition to the architecture of Oxford by Mr. Basil Champneys. It is conceived in a late phase of English Gothic, picturesque enough, and comely. A less formal drawing would have done the work better justice. At any rate, Mr. Champneys has realised that an architect has to deal with hard facts which garnished drawings may mystify and lead, perhaps, to sad mistakes in actual building. Mr. Henry T. Hare's Henley Town Hall we mentioned last week (1765): to-day we illustrate the building. Our other illustrations in this connection are Mr. Aston Webb's Britannia Royal Naval College, Dartmouth (1671), and The Union Square Chapel, Brighton, by Mr. John W. Simpson (1753), both described in our previous article. St. Luke's Parish Church, Maidstone, is exhibited by Mr. W. H. Seth-Smith's interior perspective; and the New Spire, Saltburn Church, is contributed by Messrs. Clark and Moscrop. Hard by is a row of

gables quaintly distinguishing a house at Pyford, Surrey, from the facile pencil of Mr. W. F. Unsworth. The new City Hall, Belfast, won in the late competition, makes a very striking work, by Mr. A. Bramwell Thomas (1785), a building of some promise. Messrs. Hall, Cooper, and Davis are well known for the quaintness of their designs, which are usually displayed in oddly-tinted drawings. Those shown on this occasion are no exception—viz., the Tower of New College, Scarborough; four houses at Scalby, Yorks; and more houses at Scarborough for the Gas Company. Another picturesque and clever example of Domestic design is furnished by Messrs. Silcock and Reay, in Holyrood Schools, Swindon, of which we shall give a reproduction. A drawing (1764) called 16, Stratton-street, Piccadilly, by Mr. C. J. H. Cooper, shows three diverse buildings, and there is nothing to indicate which is the number really referred to.

Mr. M. H. Baillie Scott has several coloured interiors, very decoratively furnished in an odd old-world and straight-backed fashion. The drawing-room of the Chaplain's House, St. Mary's Home, Wantage, is the first of these, with an arched roof; but the frame is too high to allow of a proper inspection. The Village Hall, Onchan, Isle of Man, seems ingenious, with a roof of green-coloured timber, and the hall of a house with an oratory leading out of it displays all the fetching fancies of this designer. Another hall is that from Kelly House, N.B., by Mr. William Leiper, who shows his staircase and gallery (1743) by a geometrical section. Mr. Thomas E. Pryce sends a highly-finished and well-tinted view of "Ifield Wood," an enlargement of an old Sussex farmhouse (1840). There can be no doubt as to the style of this brick-and-tile county, which Mr. Pryce evidently knows quite well. A crude, harsh drawing does an injustice (1810) to Mr. Charles H. M. Mileham's design for a new Pier Hotel, Southwold, a Suffolk seaside village much frequented by architects for their holidays. The Birmingham and District Counties Bank sent by Messrs. Bateman and Bateman pleases us well. The entrance, with its figure sculpture, is dignified and suitable. Mr. G. D. Martin has a coloured drawing of some tall flats at Kensington, and Mr. C. H. Townsend sends a small coloured view of the White-chapel Picture Gallery. The garden house, Fairlawn, Kent, is a Classic conservatory, added by Mr. C. J. Ferguson, of Carlisle. Miss Margaret Cooper is the architect, seemingly of a house, Dolgelly, North Wales (1843); but we do not like her green-washed stone walls and violet slates. Messrs. Wilson and Talbot send a row of cottages at Port Sunlight (1670), and Mr. J. J. Stevenson is represented by a pale washed view of Peter Memorial Church, Stirling. Mr. Edwin T. Hall shows (1868) the offices of the Metropolitan Asylums Board, already illustrated in the BUILDING NEWS. It has a very ingeniously contrived plan. The same architect exhibits a new wing to the British Home for Incurables (1866). The School Board Offices, by Messrs. Armstrong and Knowles, are being built at Newcastle (1871), and Mr. B. Pite has a washy view of a pretentious house lately erected on a corner site in Harley-street. The building has a strange lack of rhythm, with too evident an endeavour after novelty and strangeness. Its pretentiousness at any risk demands observation, while the skylights and glazed cockloft over the oriel bay make the structure look thin and ineffective. The same architect's little front in Bond-street is a far more meritorious work (1850). Mr. Mountford's Liverpool Museum and Technical School is hung far too high to allow its parts to be seen, and we anticipate the author would rather have had the drawing, which seems to be a painstaking elevational sheet,

returned than skied in this manner (1860). Mr. H. T. Buckland is further represented by a design for Port Elizabeth Public Library, sent in in competition (1824). A house with a formal garden (1818), the conceit of Mr. Allan F. Vigers, shows a tasteful ideal of a country demesne, the same remarks being equally applicable to Lea Park, Godalming (1809), by Mr. Paxton Watson, who shows his mansion house in elevation or nearly so. The Gardens by the River (1751) is another work of this class sent to the Academy by Mr. John S. Lee, of Putney. In harking back over the collection we notice a Farmery at Burton, Sussex, by Mr. Horace Field, and an oddly-shaped font with a domical cover by Mr. Ralph Knott (1711). On the corresponding splay of the gallery is a pulpit and bench-end, also of an uncommon form, for St. Brelade's Church, Jersey, the design of Messrs. Rogers, Bone, and Coles. Ipstones Church Screen (1623), Staffordshire, by Mr. G. C. Horsley, is represented by a strange-looking drawing intentionally queer. St. Luke's Church East End Decoration (1719) is the sole contribution of Mr. James Brooks. Mr. A. L. Gwatkin shows a nice design in browns for a frieze (1799), and Mr. Frank Murray is the author of a Ship Frieze for the P. and O. Company (1744) done in reds and golds with capital taste.

#### PICTURES AT THE ROYAL ACADEMY.—II.

AS we said in our first impression of the Academy last week, very few subject pictures of any distinction are to be seen this year. To some extent this loss has been atoned for by landscape, seascape, and portraiture. Many of our leading subject painters have given themselves up to the more lucrative branch of painting portraits of distinguished people. For instance, Mr. Hubert Herkomer has his full complement of pictures, all portraits, and Mr. W. Q. Orchardson four. One of the best of Mr. Orchardson's is the portrait of Lord Kelvin (87), the accomplished mathematician and authority in electrical science—a seated figure expressing both individuality and character; and equally perfect is the portrait of "Peter Russell, Esq." Perhaps his best and most characteristic portrait is in Gallery III., the "Presentation Portrait of the Earl of Crawford" (243), a careful study of the personality of the man, thoughtful, and looking at the ivory cover of an old manuscript in relief, with a jewelled crucifix. The face and head are refined and ably modelled. The colour, in tones of amber, old gold, and red, is harmonious. Mr. Herkomer's portrait, in the Second Gallery, of Dr. W. W. Baldwin (106) is a vigorous presentment of the man; the colour is natural, and not introduced to produce a harmony, and the work is solid and well painted. To these we may add the portraits of "The Lord Bishop of Truro" (92), by Walter W. Oulless; "Miss Octavia Hill," a presentation portrait, by John Sargent, R.A., and Edward J. Gregory's lady in a shot satin dress.

We now take up in more detail the principal pictures as they occur in the galleries. Seymour Lucas's work—a diploma work—(3) "News from the Front," noticed by us last week, is as accomplished as all Mr. Lucas's work is. The armoured cavalier is well drawn, seated back to an old-fashioned parlour fireplace, looking at a despatch just given to him by a bugler with top-boots, carrying a sword slung to his side. The plain deal table and furniture are scholarly and technical, and the colouring is admirable. We can hardly add anything to our description of the simple drawing and colour of two children in a wood (13), delightful in its harmony of the leafy background. Val C. Prinsep's stirring appeal to citizens, "La Marseillaise. 'Aux armes, citoyens!'"

(30) is spirited. Arthur Hacker, whose work is always of a high character, sends several pictures; his chief subject is in Gallery VIII., and is called "The Golden Hour," a charming group of maidens in a glade, to which we shall refer anon. Another work of his, "The Drone" (33), is a girl of dejected air in a field of fox-glove and larkspurs, cleverly painted. Strong and pathetically painted is George Clausen's "Going to Work," a young harvester, with scythe and basket, entering upon his day's labour, strong in sentiment and colour; and his "Allotment Gardens," in the next Gallery, a young married couple digging potatoes at sunset, also admirable in drawing and tone. Over Andrew C. Gow's brilliant and crowded canvas of the Queen at St. Paul's Cathedral, noticed by us last week, is Arthur S. Nowell's "Perseus and Andromeda," an ambitious subject, one of the principal pictures in Gallery II. The conception of the legend is masterly and bold. The standing figure of Andromeda tied to a rock surrounded by the coils of the sea monster, who is being slain by the spear of Perseus, is a subject that has often been told. The repetition of the story does not suffer in Mr. Nowell's hands; the figure of Perseus hurling the spear into the open jaws of the monster is well modelled and full of animation.

On either side of Sir E. J. Poynter's graceful portrait of the Hon. Violet Monckton in Gallery III. are some fine landscapes. Colin Hunter has hardly painted anything more effective than his "Kyles of Skye" (159), grey, limpid water and the setting of naked hills of pearly hues. Few can paint with more truthfulness and force these beautiful isles of the Hebrides. His "Signs of Herring," another picture of the same part of the coast, we noticed last week. H. W. B. Davis has given us a delightful piece of Wye scenery in his "Corig-Gwynnion" (189). Mr. Davis and Mr. Leader are both painters of English landscape, both conscientious delineators of nature, but each has his own favourite class of scenery and each his own scheme of colour. One takes the by-ways, the meadows, the overhanging foliage of streams and nooks of woodland; the other the broader and more open fields, of commons, and wooded landscape.

In the place of honour, so long occupied by the choicest works of Leighton, hangs a large family group of schoolgirls by James Sant, uninteresting in subject, and of no artistic merit. One of the most attractive studies, in portraiture at least, of a young girl in a setting of sumptuous character and richness, is by Frank Dicksee (184), whose *penchant* for luxurious background and rich colour is well known. The young, plump-faced girl, in large black hat and feathers, with white dress and canary-coloured sash, her loose hair hanging down, is sitting or resting corner-wise on a settee in a listless manner. On one side is a mother-of-pearl inlaid pedestal, on which is a silver bowl with purple anemones. Behind is a shaped mahogany buhl cabinet, with luxurious accessories, the warm and rich colours of which set off the white-frocked young maiden. Walter W. Oulless has a portrait of "The Bishop of Lincoln" (178) in a violet cassock, one of the best in the gallery. Richard Jack, in his full-length presentment of "Miss Evelyn Millard as 'Lady Ursula'" (188), has painted a characteristic portrait of this accomplished lady. She wears a pale yellow dress and a black hat, and is shown turning her head looking over her shoulder.

"Toil and Prayer" (192), by John W. Whiteley, nuns on a beach offering prayers for their toiling sisters of the sea, has pathos. John MacWhirter's "Crabbed Age and Youth" (196), an old Scotch fir gnarled with age by the side of a slender and graceful young birch, is, it is needless to say, perfect in study and colour. Several grand seapieces

are to be seen. We particularly mention J. H. C. Millar's very fine "Waves from the Atlantic, coming like White-plumed Squadrons to the Shore" (229); George Harcourt's "Westward," a noble piece of seapainting in the Hebrides, the horizon tinged by a streak of red light. J. C. Hook's delightful cliff scenes clothed with green verdure (232 and 244) are charming harmonies of blue and green, such as we may see on the Devonshire coast. In one of them we have a bay with open sea and jutting headland of cliffs; in the other there is an inner pool formed by the slips of rocks, in which a girl is looking for water-cresses, both are fresh and sunny.

W. P. Frith paints an incident recorded in "Pepys' Diary, 1667," where Charles II. is asking forgiveness, on his knees, of the imperious Lady Castlemaine. The lady looks haughty and frowning on the abject monarch. The scene shows a lady and gentleman looking through an open curtain, witnesses of the meeting. The toilet table before which her ladyship stands is laden with choice articles and jewelry, all painted with consummate care. Val C. Prinsep's subject "Cinderella" illustrates a country version of that popular character. The scene is a country kitchen, or, rather, chimney-corner of brick, with a wood fire in the hearth. A refined-feathered maiden leans against the wall holding in her short skirt pieces of wood for the fire; on the floor is a large pumpkin, and hanging on the wall above some onions. There is a thoroughly country home simplicity in the piece. The dainty face and hair, the small, well-proportioned shoeless and stockingless feet and ankles of the maiden, are all painted with unquestioned accuracy. Grace and beauty are depicted in this simple country girl.

There are few subject pictures in this gallery. F. D. Millet's picture, "The Travelled Man" (221), is certainly one of the cleverest in its quiet humour and mystery. The young man, busy at a desk, in his embroidered dress, surrounded by theatrical properties, is apparently a strolling player or comedian. His table, the floor, and walls are laden with strange mechanical figures, Oriental devices, and toys from Burma, Siam, Sumatra, and other Eastern parts. The girl in light dress stands as if in waiting upon the indolent entertainer. There is something grotesque and humorous in Mr. Millet's strange heterogeneous collection of dolls, devil figures, mechanical contrivances, slippers, &c., the very weirdness of which contrasts with the business-like air of the traveller and his serving-maid.

Two large pictures confront the visitor in Gallery IV. One is John Charlton's "God Save the Queen," painted by command of Her Majesty (273). Mr. Charlton depicts the scene Mr. Gow has painted—the Queen's arrival at St. Paul's on the occasion of her Jubilee Thanksgiving—and selects a point of view facing north, showing a sharper perspective of the West portico, and of the masses of clergy and officials standing on the steps. The houses on the north side of the the Churchyard are brought into conspicuous view. We see Mr. Maskelyne's temporary structure packed on each tier, and the windows and roofs of adjoining houses crowded with sightseers. The large area in front of the Cathedral, with Queen Anne's statue, is thronged with cavalry, the Indian escort, and bright uniforms of the officers. The assemblage on the steps is skilfully painted; but the work is rather slight, and the portraits of the notabilities are less obvious. Mr. Charlton has performed with commendable talent a difficult task, and if his picture is not so well grouped, the fault is rather in the selection of this point of view. Both these representations of a splendid pageant are worthy of the occasion.

Above hangs Gerald M. Burns's colossal picture of the "Launch of the Battleship on

the Thames," a work seen better at a distance. We cannot judge of the merits of such a subject by the usual standard of criticism. A big, unlaunched vessel in the builder's yard is not a very artistic thing; we have to estimate its grand sweep of lines, the huge mass on its cradle, the vast assemblage gathered together to witness the launch, all of which Mr. Burns has very adroitly handled with artistic power and technical skill, and his colour is very successful. We cannot help thinking that in many hands such a subject would be uninteresting or monotonous. Frank Walton's picture (282), "The Sentinels," is a broadly-painted landscape; the old church and tower stands solitary as a landmark to the mariner, the sea skirts the horizon, and in the foreground, on grassy meadow, is an old yew tree. These, we presume, are the sentinels. E. Gouldsmith's "Sundown at Sea" (276), is a fine seascape, with rolling waves, vigorous and strong in colour. John MacWhirter paints a track of wild forest (288), in which the storm has wrought havoc amongst the trees, branches of which lie on the ground. Standing in the midst of devastation is a solitary tree which has mastered many a storm. Near this Edwin A. Abbey's large and impressive picture, "O Mistress Mine, Where are You Roaming?" is a dramatically-conceived work, exhibiting much power of composition and of colour. The lady, who is being hindered by an ardent Florentine lover in her passage through a rough cloister or open corridor of huge white, shapeless piers, through which is seen an orchard in full blossom, seems reluctant to say much. The gallant is clad in a scarlet cloak, which contrasts strongly against the white pillars of the background. The particular scene of the play, whether the maiden is a Silvia or Juliet, we are left to imagine. All that we can do is to admire the simple design and its broadly-handled masses of colour. The composition is decorative, and would make a grand panel or fresco in a public building.

There is little else in this gallery. Sir W. B. Richmond's portrait of the Dean of St. Paul's (318) possesses the value of a good portrait; but there is also life, character, and animation in the massive brow of the Dean. We have already spoken of H. H. La Thangue's work in other galleries. "Harrowing" (319), a young couple drawing the harrow over a ploughed field, their faces suffused with the reddened glow of sunset, is another example of the art of a painter who has an experience of the open air, country peasant's toil, who lives amongst the harvest fields and workers he paints with so much powerful realism.

#### ESTIMATES.—V.

##### BRICKWORK, PAVING, ETC.

WE have alluded to the difficulty of assessing some kinds of labour. In such items as "extra labour and materials, cutting and bonding new to old work," "rough-cut splays in brick," "squint quoin," "skewback cutting," and the like, which are usually taken by the foot run, it is impossible to put a fair price without knowing particulars, the class of brickwork, the position and quantity of the work. The use of "constants of labour" come in very usefully here, and may be helpful. Work of this kind is often done with hammer and chisel. The constant for rough-cut splays is given by Hurst at '005 day of a labourer per foot; for birdsmouth the constant may be taken at '008, say, of a bricklayer; for skewback cutting as '020, and for cutting chases the constant may vary from '025 to '033 per foot superficial, the former for cuttings for small pipes, the latter for large chases for soil-pipes, measured per foot super.

32ft. Extra labour and materials, cutting and bonding  $1\frac{1}{2}$  brick wall to old work.

To obtain a close approximation of the value of this item, we may assume one course in every foot in height would be let into the old wall  $4\frac{1}{2}$ in.; the new brickwork would be about  $\frac{1}{2}$ ft. reduced for every foot lineal, say 1d. The cutting may be put at 2d., and the mortar at  $\frac{1}{2}$ d.—say  $3\frac{1}{2}$ d.

Laxton puts the price for labour and materials, cutting out fall of old wall, and pinning and bonding new work to same, average half-brick into old wall in cement at 10d. per foot super.

Hollow walls are measured and valued in two or three ways. In many bills the brickwork is measured nett and valued as extra only, per foot super.; or it is sometimes measured as solid, and the cavity deducted by the foot super. or cube. We think the best

plan is to take hollow walls as solid, as so much reduced brickwork, making no deduction for cavity, which is measured in the thickness to pay for the labour of forming the two separate walls; the iron or other ties being allowed for extra, though with some surveyors the ties are considered equivalent to the cavity being measured in. In most bills hollow walls are taken as so many super. feet, not brought into rods. Why this plan should exist we are unable to say, as it is much easier to bring all brickwork to the rod reduced, allowing a little extra price for hollow walls. We give two calculations.

62 rods. Hollow wall in two thicknesses of brickwork, 9in. and  $4\frac{1}{2}$ in., with  $2\frac{1}{2}$ in. cavity, bonded with galvanised wrought-iron wall ties, four to each superficial yard, and hollow kept clear of mortar droppings, &c.

Cost of a rod of reduced work solid, as before	£	s.	d.
13 3 9			
Add for one galvanised-iron tie to every 8ft. super.: say 100 ties = 60lb.; say 10wt. at 26s.	0	13	0
Labour and boards keeping cavity clear, say 4s. per rod	0	4	0
	14	0	9

Mr. Leaning gives an example of the calculation of the price per rod of a hollow wall of the above description. To the labour and materials required for a rod of solid reduced brickwork he adds the cost of keeping the cavity clear of mortar droppings, and by using movable boards at 5s. per rod, and the cost of wall ties as follows:—

Labour and materials per rod, say	£	s.	d.
13 3 9			
Hay-bands or movable boards	0	5	0
120 wall-ties, 60lb. per 100 = 72lb., at 25s. per cwt.	0	16	1
	14	4	10
Deduct $\frac{1}{6}$ th of £13 3s. 9d.	2	3	6
	12	1	4

Damp-proof courses are of various kinds: slate in cement; a mixture of pitch, tar, and sand, boiled and laid hot on the bricks; asphalte, such as Claridge's patent asphalte; Val de Travers compressed asphalte, Callender's pure bitumen dampcourse or foundation felt, White's "Hygeian Rock" building composition, and perforated stoneware tiles or slabs, as those made by Messrs. Doulton and J. C. Edwards, Ruabon. The last are made in salt-glazed ware, vitrified, blue, red, and buff terracotta, and answer for air bricks as well as to prevent damp rising. Each of these kinds has its advantages. The asphaltes, White's Hygeian Rock composition and Callender's bitumen dampcourse are the most largely used (see advertisements).

260ft. super. Damp-proof course; two courses of slate in cement, lap-jointed.

This may be priced at  $5\frac{1}{2}$ d. per foot.

If we suppose the cost of two slates to be  $3\frac{1}{2}$ d. per foot, the item may be made up thus—

Slates	£	s.	d.
10 per cent. waste cutting	0	0	$3\frac{1}{2}$
Cement and sand	0	0	1
Labour laying	0	0	$0\frac{1}{2}$
	0	0	$5\frac{1}{2}$

320ft. super. Damp-proof course of the best mastic asphalte  $\frac{1}{2}$ in. thick.

This is priced in Laxton's at 3s. 9d. per yard super., laid in London, in quantities of 20 yards and over, which would be about 5d. per foot, including profit. For ordinary work in large quantities 2s. per yard is a fair price often charged by asphalters, or, say, 3d. per foot without profit.

A dampcourse of pitch, tar, and sand  $\frac{1}{2}$ in. thick may be laid at  $1\frac{1}{2}$ d. to 2d. per foot; but for any large quantity the best plan is to obtain a price from the manufacturer.

24 yards super. Damp-proof course laid with White's "Hygeian Rock" composition  $\frac{1}{2}$ in. thick.

It is stated that 1cwt. will cover  $2\frac{1}{2}$  yards  $\frac{1}{2}$ in. thick. The composition, including carriage, is stated to be £5 16s. 8d. per ton, therefore 1cwt. will be 5s. 9d., and the cost per yard about 2s. 4d.; add labour and profit. It is best to obtain a price for laying complete from maker.

22 yards. Portland cement paving to basement  $\frac{1}{2}$ in. thick, and trowelled smooth.

This item may be made up as follows:—

Cement and sand	£	s.	d.
0 0 10			
Labour	0	1	0
	0	1	10
Profit	0	0	2
	0	2	0

In estimating the bed for paving, allowance has to be made for a thin layer of lime or cement mortar and the jointing. A preliminary calculation of the materials required for a cubic yard of cement mortar is necessary.

If we allow 1 of cement to 3 of sand we shall have:—

9c.ft. of cement at 1s. 6d. per foot	£	s.	d.
0 13 6			
27c.ft. of sand at 7s. per yard	0	7	0
Labour, mixing, screening sand, &c.	0	2	3
	1	2	9

Divided by 27 will give about 10d. per cubic foot.

36 yards super. Paving of hard stocks laid on edge in sand, including cutting and waste.

Here, if we take 53 bricks, allowing 10 per cent for waste, at 34s. per 1,000, it will be 1s. 9 $\frac{1}{2}$ d., and add for one cubic foot of sand at 7s. per yard, say, 3d., and labour 10d., it will give 2s. 10 $\frac{1}{2}$ d. per yard.

If laid in mortar the cost would be about 3s. 9 $\frac{1}{2}$ d.

22 yards super. Hard stock paving laid flat in mortar:—

36 bricks at 34s. per thousand	£	s.	d.
0 1 2 $\frac{1}{2}$			
Mortar, say 1c.ft.	0	0	7
Add labour, say	0	1	0
	0	2	9 $\frac{1}{2}$

12 yards. Tile paving, including laying, with tiles p.c. 10s. per yard at works.

Add for carriage. Obtain list of prices of manufacturer—Minton, Stoke-upon-Trent; J. C. Edwards, Ruabon; T. and R. Boote, Burslem; or other maker; also for cement and profit. If the price is, say, 12s. delivered, then add, say 6d. a yard for cement; laying, say 1s. 6d. per yard; in all, say 14s. per yard. But the price will vary much with the quantity required. A small vestibule or lobby laid in geometrical patterns with the best 6in. tiles will cost the above price.

The cost of a floated cement surface for paving or tile hearths may be found by taking the cost of 1 bushel of cement and 2 bushels of sand, which is calculated to cover 9 yards, added to labour. If we put the items down as follows:—

1 bushel of cement	£	s.	d.
0 2 0			
2 bushels of sand at 7s. 6d. per yard	0	0	10
	0	2	10
Say	0	0	4
Add labour	0	0	6
	0	0	10
Profit, &c.	0	0	1
	0	0	11

15 yards. Paving of 6in. red Staffordshire tiles laid on a cement surface.

Laxton gives the prices of 6in. by 6in. Staffordshire tile, 1in. thick, best pressed quality, red, blue, and buff, at 9s. 6d. per yard super., including labour, to which add cement floating, cost of laying, carriage, &c.

Tiles, including carriage, say	£	s.	d.
0 10 6			
Cement floated surface, say	0	1	0
	0	11	6
Add profit	0	1	3
	0	12	9

This is a high price, and for ordinary Staffordshire tiles 6s. 6d. may be taken as a fair price, including labour and laying.

#### CONFERENCE ON ROAD MAKING MATERIALS AND APPLIANCES.

ON Friday and Saturday afternoon last papers on "Road Materials and Appliances" were read and discussed in the Conference Room at the Agricultural Hall in connection with the *Surveyor* special exhibition in the north gallery, at the very successful Building Trades Exhibition now in full swing. The attendances were very good, the room being well filled by surveyors, clerks, and workers of urban and rural authorities, and a keen interest was manifested in the proceedings.

On the Friday the chair was occupied by Alderman C. W. Cope-Proctor, chairman of the Works Committee of the Bristol Corporation, who in his address referred to the improvements made during recent years in street paving and road construction.

#### STANDARDISING THE INEQUALITIES OF ROAD SURFACES.

Mr. H. PERCY BOULNOIS, Engineering Inspector to the Local Government Board, and late City Engineer of Liverpool, read the first paper, in which he remarked that this was the first occasion in which a collection of road-making materials and appliances had been brought together, and as such the exhibition was of very great interest. The lecturer gave a brief historical sketch of the making of roads from the mere foot-worn track to the days of the Romans, from which time, he observed, nothing was attempted until about a century ago, when John Metcalf, a native of Knaresborough, who became totally blind at the age of 25, began improvements which were continued by John Loudon Macadam, John Telford, and others. Having

alluded to the many patents for paving road surfaces taken out during the past 70 years, the author turned to the question of the designing and construction of roads, and remarked that for the former a theodolite, a good level, and some boning rods were all that an engineer really required to lay out a road. Movable screw templates were sometimes used in order to give the proper contour to a road; but this could be quite sufficiently carried out with boning rods in the hands of a skilful person. There was an instrument being shown in that exhibition for the first time, which he thought was an ingenious novelty. He referred to the "Viagraph," invented by a Mr. Brown, of Belfast, which was the first instrument he had ever heard of which would give a graphic delineation of the badness or otherwise of the surface of any road, and which enabled one to standardise a road surface. He knew nothing as to the inventor, and need hardly explain that he had no interest in the instrument, but brought it forward, as it impressed him as the germ of a useful auxiliary to the road surveyor, when he noticed it in the exhibition. The instrument consisted of two parallel straightedges, several feet in length, and 6in. apart, looking like a long low sledge. It was drawn along the surface of any road at a speed of anything under eight miles an hour. Between the parallel straightedges or runners a recording instrument was placed. By a simple arrangement a saw-edged steel wheel, just sufficiently weighted, rested on the hard surface of the road, and when the sledge was pulled along, the wheel followed the depression or projections in the road, and by simple mechanism recorded these depressions and projections by means of a pencil on a drum of paper which unwound for the purpose as the machine was pulled along. A profile was thus secured which could be compared with any other road similarly tested. A second pencil marked a horizontal line on the paper which was the datum line. There was also an ingenious counter on the instrument which marked off the sum of the unevenness in the road, and thus a unit was arrived at which gave in feet per mile the sum of the unevenness. Thus on a trial with this machine on a good road between Guildford and Leatherhead, the sum of unevenness showed about 12ft. per mile, whereas on the Belfast and Lisburn road it amounted to 121ft. per mile, so that the Lisburn road was ten times worse than the Guildford road.

#### THE WEARING QUALITIES OF ROAD MATERIAL.

Mr. J. VINCENT ELSDEN, B.Sc., Lond., in a second paper, dealt at considerable length with the qualities of various granites, limestones, elvans, and other stones as road-making materials, remarking that the position of a substance was very different when regarded purely as a mineral aggregate, and when considered as to its power to withstand the attrition of road traffic. Again, a stone which would be discarded as valueless for paving setts might still be of great service when broken up for macadam or when used as a substratum pavement, as in Telford's system. Other stones which were deficient in the leading properties necessary in a good macadam might still be advantageously used in conjunction with some other material or when consolidated into an artificial concrete. Much inferior stone, quarry waste, was capable of being utilised in the manufacture of artificial paving slabs. Further, many stones had earned a bad reputation undeservedly, while the real fault was in the method of road construction. The tendency of modern experience was to provide a hard unyielding foundation, for a soft foundation was found to involve a considerable amount of wear and tear near the bottom of the road, whereas the aim should be to limit the wear to the superficial and easily-repaired surfaces. In dealing with granite it was necessary to consider the mineralogical composition, the size of grain, and the orientation of the crystals, for when the crystals did not lie in any definite position the strength was increased, and at the same time splitting was more difficult. The author drew attention to the errors in nomenclature in road materials. The present state of our knowledge of the wearing properties of good road stone was in a very backward state. The subject was well understood from a geological point of view, but not from a practical standpoint, though, thanks to the microscopical methods of examination, we were getting a fairly complete knowledge of the mineralogical composition of the most important road masses of these islands. But mineralogical composition,

although all-important as to durability, was not the only part for consideration. They had also to take into account the toughness or resistance to abrasion, binding properties, foothold, and ease of traction, amount of absorption, and other points. Unfortunately, also, some of these properties were in inverse proportion to others. Thus the tendency to wear to a smooth and polished surface characterised many of our hardest and most durable stones, and rendered them practically useless for paving purposes. Durability was frequently inversely proportional to the toughness as in the case of flints, which chemically was the most stable and unalterable of minerals, but of which many varieties were extremely brittle. How should they estimate the value of attrition tests? They had attrition tests, of which the most recent were those of Mr. Lovegrove and Professor Elliot; then there were drop tests, absorption tests, and comparative strength tests; but the author questioned if any one of these taken alone corresponded with the test of practical experience of the behaviour of a stone under actual traffic. What was really wanted was a series of careful trials performed upon a few typical stones, and the construction from the results of these tests of a definite scale, somewhat like the scale of hardness adopted by mineralogists. By this means a clearer idea would be conveyed of the character of a road stone than was possible from the present chaos of figures which represented the result of tests conducted perhaps with the greatest skill and accuracy. If a scale could be devised having ten typical stones arranged in a definite order as regarded resistance to abrasion, then any stone could be given its number on the scale. He might suggest Penmaenmawr stone might form No. 1 in the series, and such a material as inferior sandstone might form No. 10. He would also advocate a scale of comparative strength. The same chaos and difficulty of comparison pervaded the present method of estimating this feature of a stone, as in the case of abrasive tests, and the like applied to the question of comparative durability. The construction of such a series of scales would not be easy—its very difficulty showed its desirability; but he would suggest the following as a tentative illustrative list, subject to revision and amendment:—1, Penmaenmawr stone; 2, Cleve Hills granite; 3, Mount Sorrel granite; 4, Hartshill quartzite; 5, Whin stone; 6, Mendip limestone; 7, Pennant grit; 8, Kentish rag; 9, Cornish stone; 10, flint. If they had to place these stones in their relative order of merit as regarded any one of the following properties—attrition, durability, foothold, absorptive power, and compressive strength—they should have but little difficulty in determining the beginning and end of the series, but the intermediate places would not be easy to arrange.

A short discussion followed, engaging Mr. J. Patten Barber, surveyor to the Islington Vestry (who thought the viagraph too delicate a mechanism for use on ordinary roads); Mr. T. H. Yabbicom, city engineer of Bristol; Mr. T. Longdin, borough surveyor of Warrington; Mr. John Brown, of Dunmurry, near Belfast, the inventor of the viagraph (who explained that he was not a surveyor, but a coach proprietor, and devised a rough implement to convince the rural authorities in his own neighbourhood of the unusual badness of certain main roads, when several surveyors told him the instrument would be of general use if strengthened and perfected); Mr. W. Nisbet Blair, surveyor to the St. Pancras Vestry; and Captain Aubert, chief engineer of roads under the Norwegian Government.

On Saturday the conference was resumed, the chair being occupied by Mr. T. de Courcy Meade, M.Inst.C.E., city engineer and surveyor of Manchester, who gave an interesting address on road-making.

#### NEW MATERIALS AND NEEDED MACHINERY.

Mr. SIDNEY STALLARD, Surveyor to the Maidstone Rural District Council, drew attention to a model of cross-section, showing drainage exhibited by Messrs. Blitchfield and Co., constructed of Rouge Royale quartzite setts, each 6in. by 4in., from the quarry of Pecherel. While in Paris recently the author had interviews with M. Boreux, the chief engineer of the bridges and roads of that city, and M. Deval, until recently the director of the laboratory for the testing of materials for the same city. The author also had the opportunity of inspecting the materials for road maintenance at one of the central depots of Paris. The Rouge Royale quartzite setts were classed by M. Deval, after

repeated theoretical and practical trials, as the best for paving important thoroughfares on account of their homogeneity and durability. They were used in the Rue de Rivoli and on some of the boulevards, and there had been no complaints of slipperiness. It was desirable on many grounds to get in homogeneous and level materials, but some setts possessing these qualities had the grave drawback of becoming polished and slippery with the action of traffic. Turning to the consideration of channels and gutters, Mr. Stallard remarked that in purely rural districts paved gutters were unheard-of luxuries, and with the present labour difficulties were likely to remain so. He had found ordinary tarred macadam formed a good gutter for country districts if carried to a width of 3ft. from the curb edge. Hardly a morning passed without the average district surveyor being informed that someone had made the great discovery of an absolutely perfect gully or grating. The aim should be to get a gully which possessed a perfect seal for dry weather, such as that made for Mr. C. Mason, the surveyor to St. Martin's-in-the-Fields Vestry, or that shown by Mr. A. E. Collins, of Norwich, while the excellent gully designed by Mr. Read for the city of Gloucester, which was easily emptied and replaced by street-sweepers without outside mechanical contrivances. He held that no gully grating ought to be constructed that did not allow for the greater width between the bars being on the under side, to allow of stones dropping through. In the South of England stoneware gullies had not made the rapid progress that had attended their introduction into the Midland and Northern districts. The author called attention to the most useful tabular forms as to traction on roads, lent by Mr. W. Nisbet Blair, engineer to the St. Pancras Vestry, which would save surveyors many a weary hour classifying traffic and preparing working data. It was curious that no exhibit had been received for measuring the force of traction on roads, but such an apparatus was greatly wanted, and another need was a water-tight barrow for gully-emptying in rural districts.

#### MACHINERY AND TOOLS FOR ROADS AND ROAD-MAKING.

Mr. J. PATTEN BARBER said the continual increase of traffic on our roads, and the augmented cost of labour necessary for their maintenance, had opened up an extensive field for the exercise of mechanical skill. Many machines had been manufactured, and many more had probably had an ideal existence in the minds of inventors, but had not seen the light of day. Very many of the machines which had been made had failed to accomplish their purpose; but others were of great service to those engaged in road-work and to the public. One of the most recent inventions was the scarifier, which was in many places received at first with disapproval. The improvements made in these machines, and the small cost of working them compared with that of hand-picking macadamised roads, had effectually silenced their opponents. The earlier types consisted of a heavy trolley armed with tines at each end, raised and lowered by a screw worked from a hand-wheel. The machine was mounted on low wheels at the sides and a leading and trailing wheel, and was attached by chains behind a traction-engine or steam-roller. Having been drawn to the end of the length of road to be lifted, the engine was detached and brought to the other end of the scarifier, which was again set in motion over a parallel piece of road, a second set of tines being lowered and the first set raised. Some loss of time was obviously involved in changing the position of the engine, and the attachment of the scarifier not being rigid, the instrument was often diverted from its direct course, leaving strips of untouched surface to be subsequently picked-up by hand labour. A later and improved type of machine consists of a trolley with a wheel at either side. Two sets of tines were carried on an axis, along which they could be slid so as to lift the road metal at a distance of a foot from the last part dealt with on either side of the road without turning the engine. The tines were raised or lowered by a hand-wheel at the rear, and were so arranged that the raising of one set lowered the other. The machine could be attached to the rear of either a traction engine or steam roller, and could be worked forwards or backwards without turning the engine. One disadvantage of this improved scarifier was that one wheel of the engine travelled over a portion of the road which had been lifted. A still

later type was that in which the scarifier was attached to the side of a steam road-roller or traction-engine. Three machines of this description were in the yard of the hall. One of them was attached to a steam roller immediately behind the off-side driving wheel, a spring being fitted to each time to prevent vibration on the engine; but this scarifier only worked when the engine travelled forward. Another variety had two sets of tines, and would work both forward and backward; it was attached by a bracket and plate to the driving-wheel axle of a steam roller at the off side of the tender, the front part of the plate being secured to the down-plate, and the rear part to another plate at the rear of the tender. When travelling forward, the roller ran clear of the lifted road metal, but when worked backward the metal lifted by the tines was immediately travelled over by the driving-wheel following them. Next to the machinery for lifting the metal of a road, that for consolidating the new material and producing a firm, even, and true surface, was to be noticed. For this purpose horse-rollers were little used; but when employed, they were now weighted with water, and the shafts were carried on a rotary table, which rendered it unnecessary to turn the roller bodily. Steam rollers were now largely used, not only on urban roads, but also in many country districts. Many improvements had been made in steam rollers during the last few years, such as the more extensive use of steel, improved arrangements for the supply of steam to the gland, improved steering gear and scrapers, renewable rims to the driving wheels, &c. The compound engines now made were not in all respects superior to the single-cylinder engine. The writer thought the following features advantageous in steam rollers:—The placing of the gearing between the bearings, instead of outside; the supply of steam to the cylinders from a dome, instead of through the two short pipes attached to the steam-chest; and the making of both rims of the driving rollers the same thickness throughout the entire width. The author also referred to the machinery for cleansing roads, including horse sweepers and brooms, and to the tools used in road-making, drawing special attention in the latter stage to the stone-rakes shown by Mr. J. Dunn, surveyor to the Chesterton Rural District Council, and a squeegee invented by Mr. F. Smythe, surveyor to the Finchley Urban District Council.

A short discussion ensued, in the course of which Mr. Hall, of Cheltenham, said Mr. Stallard's suggestion of a three-foot wide asphalted gutter channel suggested a coming paradise for cyclists. Mr. Howard Smith, late city surveyor of Carlisle, and now engineer to the British Traction Co., referred to the scarcity of reliable English facing setts. Mr. Thomson said the great fault of scarifiers was that they were generally set by the foreman to pick the road to too great a depth. Mr. Brooks and others having spoken, the chairman closed the discussion, and thanks were accorded the readers of papers and the chairman.

#### SPECIFICATIONS.\*

A SPECIFICATION may be either lengthy or curtailed, according to the particulars given upon the drawings. Some engineers favour a short specification, and prefer to put as much written information as possible upon the drawings, one reason for this being that engineers usually supply a number of detail drawings with their contract plans, which enables them to put many notes upon those drawings. On the other hand, architects do not usually supply many detail drawings; consequently somewhat lengthy specifications are necessary. To my mind, either method may be adopted if the requisite information be clearly given. I can conceive of a set of plans prepared and written up so fully in detail that a specification as a separate document might become unnecessary; this sometimes happens in a certain class of work. On the other hand, I can scarcely imagine a specification so full in detail as to dispense altogether with the plans, unless it related to a very small and simple erection or to general repairs or decorations. I would ask you now to assume that both plans and the specification are necessary for general work; I will then suggest

#### A FORM OF SPECIFICATION

which shall be curtailed and yet shall not detract

\* By F. W. MACEY. A paper read before the London Architectural Association on April 23, 1899. (See p. 623 post.)

from the full and clear description of all parts of the work. A specification should not supersede the particulars given upon the drawings; but should more fully explain those parts which the drawings do not clearly illustrate, or which are in any way obscure. It is impossible to show every detail, or give every particular upon the drawings, consequently a full description of those parts becomes absolutely essential in the specification. The plans give the general arrangement of the building, and the specification should describe the details of that arrangement. The plans should have figured upon them every important dimension, such as the lengths, widths, and heights of the various distinct parts of the building; the thickness of walls; the depth and width of the concrete foundations; the sizes of floor joists, roof and flat timbers; the widths and heights of doors and windows; and all other similar and important parts and items. It is seldom that plans to a small scale are so accurately drawn as not sometimes to be obscure with regard to the sizes of certain parts unless these parts are given in figures. The only other particulars in writing to be put on the plans would be the names of the rooms and other parts of the building, together with any notes or references which might assist the description in the specification. With regard to small-scale drawings, do not labour the elevations by showing every brick and slate. Working drawings will be far clearer without too many lines, and there is no need to finish them like a picture. But

#### IN THE SPECIFICATION INCLUDE EVERYTHING

except the general dimensions of the various parts of the building. Of course, the sizes of the joists and roof-timbers are always described in the specification, as well as sometimes being given on the plans; and I see no harm in stating the thickness of the various walls, the depth and width of the concrete under the walls, or any other detail of the building. A specification which is full, but at the same time concise and to the point, will prevent mistakes and misunderstandings when the building is in progress. Need I remark that the specification should always agree with the drawings? Presuming, then, that the plans are before you, but not in too great detail, and that you have decided to write a rather full specification—what, then, is the first consideration? You must have a complete knowledge of each subject—that is, a full grasp of the details of building construction, and of the value and properties of materials. In other words, you must know what you want to describe, and, knowing that, you must be acquainted with the requirements attendant upon those wants; and you may take it for granted that until you are proficient in these matters you will never be able to commit to writing the proper descriptions needful to the erection of a building. Therefore, I say that

#### A COMPLETE KNOWLEDGE

of all the requirements and details of the various trades coming within the scope of the architectural profession is the first consideration to efficient specification writing; and I might also add a knowledge of the various Acts relating to buildings. But it may be said that it is impossible to know everything, and when in doubt, the only way is to put a provisional amount to cover any such point, and to obtain afterwards the information from a friend or specialist. This is true, and may be the only course to adopt at the time; but ready and accurate knowledge will benefit all parties concerned. The question then arises, What is the best way to obtain such knowledge? I know of only two ways—study and observation. What I do myself is first to read any works obtainable which bear upon any doubtful point, and I would also add that much useful information can sometimes be gained from trade catalogues. I then discuss the matter on every possible occasion with anyone I come across who has any knowledge of the subject, and, further, I keep my eyes open and learn all I can from what is going on around me. You have only to pass down any street where building operations are in progress to gain many practical hints. You now proceed to write the draft specification. This is often hurriedly written, much being left to alter and supplement when revising for fair copying. This is a great mistake. A draft specification should be written with care and thought. Being fresh to the matter, even so dry a subject creates a certain amount of interest, and if you con-

centrate your mind upon the subject you will be less liable to omit many small items. Therefore,

#### LET THE FIRST DRAFT BE AS COMPLETE AS POSSIBLE.

I might suggest that when engaged upon the plans, it will be found of great assistance if notes are made of any obscure item coming under your observation at that time. Just a reminder here. When sending out a number of fair copies, see that they all agree. Should the quantity surveyor write the specification for the architect? In the abstract it seems absurd to ask such a question were not this practice so frequently followed. Personally, I think

#### THE ARCHITECT SHOULD WRITE HIS OWN SPECIFICATION,

and not delegate the work to another. A quantity surveyor cannot know what is in the architect's mind, therefore it is impossible for him to describe fairly that which embodies the architect's best ideas. It is unjust to the quantity surveyor to ask him to attempt to do so. It is also unjust to the client, and the architect has no right to accept payment for work done by another. One other word with reference to the quantity surveyor. When he takes out the quantities it is usual for him to make notes of any omitted items on the architect's specification. Should he not do so, however, the architect must run through the bills of quantities, and adjust the specification to them before the contract is signed. Reverting to the subject-matter,

#### A FULL SPECIFICATION

will save many an anxious moment. Constant disputes occur with the builder, many extras crop up owing to imperfect wording and omissions—ordinary care would prevent all this. And remember always that a specification is a legal document. Bearing somewhat on this incomplete description of work, attention might be called to the fact that one so often sees in a specification wording to this effect:—"That the builder is required to perform a certain work all complete," or "all as required," or "as necessary." This generalising shows the architect's ignorance of what is required; and it is not reasonable to ask a man to estimate for something of which you yourself do not know the requirements. Consequently you either get an unfair estimate or an incomplete work, or else a squabble ensues with the builder as to what was intended or required. Should you ever be in this difficulty of not knowing what is necessary, then the best plan is to put a provisional amount and let the item work itself out in execution. Therefore let your terms be definite and clear. Some make a great point as to which is the correct word to use, "provide" or "supply." I think it very unimportant. There certainly is a slight difference; but, at the same time, to provide you must supply, and to supply you must provide. Agreeing, then, upon this point that a specification must be somewhat full, and, consequently, lengthy, what then is the

#### BEST WAY TO CURTAIL THE DESCRIPTIONS

without detracting from the merits of the document? There are several ways. Many items which will apply to several parts of the building under similar conditions may be generalised. Thus, take for example the skirtings to a building. A general clause applicable to all skirtings may be inserted, somewhat to this effect: All skirtings to be rebated to floors, tongued and mitred at angles, tongued at heading joints, housed into architraves, returned and mitred at ends, and fixed to double splayed narrow-framed grounds with dovetailed backings and filling-out blocks, and plugged to walls. The only further description then necessary will be to refer to each particular skirting, such as:

Attic skirtings 7in. by 1in. plain deal.

First-floor skirtings 9in. by 1 1/4in. moulded deal.

And so on. Here, then, the description of the fixings to each separate class of skirtings is avoided. In the same way the backings to door and window linings, and many other items where the conditions are similar, may be generalised.

(To be continued.)

The stained-glass window which has been placed in the east end of St. Keverne Church, Cornwall, to the memory of the 106 victims of the *Mohegan* disaster was unveiled on Wednesday week by Mr. A. S. Williams, manager of the Atlantic Transport Company, and was dedicated by Archdeacon Cornish. It was designed by Mr. G. F. Bodley, A.R.A.

THE BRITANNIA ROYAL NAVAL COLLEGE, DARTMOUTH.—NEW TOWN HALL, HENLEY.—UNION CHURCH, BRIGHTON.—TWO HOUSES AT SOUTHMINSTER.—ITALIAN AND FLEMISH FURNITURE.

## Our Illustrations.

BRITANNIA ROYAL NAVAL COLLEGE, DARTMOUTH.

LAST week we referred to Mr. Aston Webb's important exhibit at the Royal Academy illustrating the Naval College on the Mount Boon Estate overlooking the river Dart, some short distance from Dartmouth. To-day, as then promised, we publish the drawing alluded to. The college site is some 200ft. above the river level, and is situate directly above the spot where the *Britannia* is stationed. The college will accommodate 260 cadets and staff. In the central block is a large hall measuring 90ft. by 50ft., having classrooms on two floors on either side, as well as lecture-room, chart-room, steam study, and also reading-rooms. The seamanship room is located at the end of the hall. The captain's room and chief officer's apartments occupy the front of this block, and here are placed the instructors' rooms. The dormitories and dayrooms range on either hand of the central block, each wing taking 130 cadets. The dayrooms are below, and the dormitories, each for 33 cadets, are over them. Hammocks and sea-chests are used, and the lieutenant's room is situated between the dormitories. The sanitary blocks extend on the north side, with shower-baths and changing rooms on the ground floors, and lavatories, bath-rooms, &c., as adjuncts to the dormitories over. The cadets' dining-room is approached from the end of the main corridor by way of a large lobby at the western end of the building. This refectory is 30ft. by 40ft., and is provided with serving-room, cadets' kitchen, and the usual stores, and scullery. Overlooking the prospect are placed the wards for officers, and their mess-room adjoins, with kitchen and stores *en suite*. The petty officers' rooms and mess are contrived on the north side. At the east end of the college is a block of corresponding scale, comprising the captain's house as well as the chapel, accommodating 350 worshippers. The spacious terrace towards the south, along the front of the College, is 34ft. wide, from whence a view is obtained of great beauty towards the mouth of the Dart. A curved ascending drive forms the approach at each end, as shown by the perspective, and in the centre a flight of steps makes a great feature. Under the terrace are covered playgrounds. Gardens will occupy the space inclosed by the terraces and roads. Mr. Marshall, of Plymouth, is the contractor, and the terrace walls are being faced with local limestone. Mr. H. E. Milner is supervising the grounds, roads, and playing fields. Portland stone will be used for the buildings, with red brick and green slates. Infectious and non-infectious blocks for the sick quarters will stand to the west of the main structure, and there will be a doctor's house and residence for the nurses. The architect is Mr. Aston Webb, A.R.A., F.S.A.

## HENLEY TOWN HALL.

THIS design, illustrated from the architect's Royal Academy drawing, was selected in a limited competition early last year, and the work was commenced in December last. The buildings contain municipal offices, council chamber, and large meeting hall. The materials being used are red-brick facings, with dressings of Bath stone, and the roofs are covered with Colley-Weston stone slates. The whole of the floors are of fireproof construction. The architect is Mr. Henry T. Hare, F.R.I.B.A., architect, of 13, Hart-street, Bloomsbury-square, W.C.

## UNION CHURCH, QUEEN SQUARE, BRIGHTON.

WE illustrate this week from the Royal Academy a double-page perspective of Mr. John W. Simpson's bold and clever scheme for the rebuilding of the late Rev. Paxton Hood's Chapel, at Queen-square, in the centre of Brighton, at the top of North-street. The site, as will be seen by the accompanying plan, is V-shaped, the apex being occupied by the Congregational Church, to the north of which are three private houses, and beyond these a Baptist chapel. It is proposed to clear this entire area, having a frontage of 290ft., and a maximum depth of 104ft., and to build thereon a chapel seated for 2,000 persons, and to the north of this a lecture-hall, surrounded on three sides by classrooms. The south end or apex of the site will be occupied by an entrance-hall, secretary's office, and cloakrooms. The site is somewhat restricted in width, and has a considerable variety in level, there being a rise of 20ft. on the Air-street side from north to south. This has enabled the architect to provide entrances to the floors on various levels without necessarily using the staircases—a somewhat uncommon advantage. The central portion of ground floor is entered from the corner of Air-street; the side seats are raised, and are approached from a main corridor which runs between Queen-square and Zion-gardens. Three ample staircases provide for communication between upper and lower portions of the church. Retiring rooms are provided off the main corridor, and the vestries for minister and deacons and the choir practice room are conveniently placed along the eastern side and Air-street frontage, but do not form a part of the actual church. The exterior of the building will be entirely faced with stone, and the interior of the chapel will also be of white stone up to and including the main cornice at the springing of the dome, except where oak panelling is introduced. The dome will have an external diameter of 65ft., and will rise from the springing at the main cornice, which is 58ft. above the floor level, rising to a height of 85ft. above the pavement. It will be constructed of concrete, covered with lead, and, internally, the surface will be plastered. It is hoped, eventually, to cover the internal surface with designs in mosaic, taken from Francis Quarles' "Emblems." The seating of the chapel is proposed to be by chairs, and the flooring of hard wood-blocks. In the Queen-square front, under enriched niches beneath pediments, will be statues of Oliver Cromwell and John Knox. At an early date we shall give further drawings of the building, including an interior view, which is also now at the Royal Academy.

The Council of the Royal Archaeological Institute had decided to hold the annual meeting at Ipswich this year, from July 21 to August 1, and excursions will be made in the neighbourhood each day.

Messrs. Thompson and Sons, of Peterborough, the contractors for the restoration of the cathedral in that city, have been authorised to proceed with further works at a cost of £964, chiefly in connection with the pinnacles of the south-west tower.

By order of the Local Government Board, Colonel A. G. Durnford, R.E., has conducted a public inquiry at Barry, Glam., into an application of the urban district council for power to borrow £12,835 for private street works, £2,350 for public offices, and £1,900 for works of surface-water drainage.

A mission church in the parish of Nunney, near Frome, was opened the other day. It is a substantial structure, with wood-block floors and walls of local stone, and windows and dressings of Bath stone, the roof being open-timbered, boarded below, and covered with dun-coloured Bridgewater tiles, and a western spirette. It consists of nave, chancel, and vestry, and has been erected at £2 ls. 3d. per sitting by Mr. Charles Barnes, of Frome, from the plans and under the superintendence of Mr. E. H. Lingen Barker, of London and Hereford.

## THE ROUND TOWERS OF IRELAND.

MR. ANTHONY SCOTT, of Drogheda, read a paper on this subject illustrated by lantern views of the principal structures of the kind remaining, before the Society of Architects at their meeting held at St. James's Hall, Piccadilly, on Thursday evening in last week. Mr. Walter Emden, the President, occupied the chair. Our knowledge of the origin and history of these towers was, Mr. Scott remarked, deplorably scanty, owing to the wholesale destruction of Irish manuscripts by the representatives of English rule in Ireland, and, as Dr. W. K. O'Sullivan told us, even down to "the first part of the 18th century, the possession of an Irish book made the owner a suspected person, and was often the cause of his ruin." Most of our reliable information on this topic was due to the researches of the late Dr. George Petrie, who wrote in 1833 an essay to which the Royal Hibernian Academy awarded three gold medals. Under Sir Thomas H. Deane, the official superintendent for the last thirty years of the National Monuments of Ireland, it had been the author's pleasing duty for some twelve years to supervise the restoration of these ancient towers and temples of past ages—to trace in the ecclesiastical ruins the rise, development, and transition from the primitive tiny quadrangular church with its western doorway, having inclined or sloping jambs, to the beautiful groups of Romanesque monastic buildings of more modern times. All lecturers were agreed that the stone-built churches were the work of the Early Christians; but great uncertainty and doubt had hung about the neighbouring round towers. After close study of the buildings themselves, he had, however, formed very decided opinions as to their origin. The theory advanced by the late Canon Ulick Bourke that they were primitive Pagan structures adapted to Christian uses, and the suggestion of Archdeacon Lynch that they were first erected by the Danes, he dismissed as equally untenable, the lecturer's belief being that they were developed from the circular beehive cell of the Early Christians, and those again from the round raths used in still earlier times as places of defence. The workmanship and materials employed in the towers was analogous, and in many instances later than that in the adjoining churches, as was notably evident at Ardmore, Dunchurch, and Kilmacduagh. The lecturer described the construction and characteristic features of the towers in detail, and showed how much variety they exhibited, showing a gradual evolution and development. The stones used varied with the locality in which they were built, and there was a wide range of height and treatment and great diversity in the character and amount of ornamentation. In many cases they were decorated with crosses in relief over the doorway, and probably the conical cap often once terminated in a cross.

## CHIPS.

The memorial-stone of the new Friars' School was laid at Bangor last week by the recently-consecrated Bishop. The building will be Elizabethan in style, and built of Llysfaen stone with red sandstone dressings. On the first floor is an assembly hall 58ft. long, and over the dining-hall are dormitories for 20 boys.

The Wesleyan chapel at Pool, Cornwall, was reopened on Thursday in last week, after re-seating in pitch-pine, redecorating, and the addition of a new heating apparatus. Mr. Sampson Hill, of Redruth, was the architect, and Mr. W. C. Hodge the contractor.

Dr. Bilsborrow, Bishop of Salford, recently laid the foundation stone of a new Roman Catholic school-church, to be called St. Augustine's, at Accrington. The school-church will cost £6,470, and will provide accommodation for 670 children. Later on a church will be erected, together with a presbytery. The present building will then be utilised as a school. The architect is Mr. Hill, of Manchester.

The Leith parish council have under consideration a report furnished, on their instructions, by Mr. W. M. Thomson, architect, Edinburgh, as to the desirability of providing an entirely new poor-house to take the place of the present inadequate and unsuitable houses in North and South Leith. Mr. Thomson recommends the selection of a site of 9½ acres at Easter Duddington, and the building thereon of a house for 500 inmates, the estimated outlay being £57,000 for site and buildings. He estimates the market value of the existing poorhouse site at £22,000.

ITALIAN AND FLEMISH FURNITURE.

## ITALIAN AND FLEMISH FURNITURE.

**T**HE Oak Cabinet is Flemish. It is profusely carved with floral and foliage designs, the panels to folding doors having fluted pilasters with carved caps, surmounted by circular heads, the spandrels of which are also carved. The body of the Cabinet is mounted on turned legs, the whole forming a handsome and useful piece of furniture. The sketch was made at Messrs. Christie's Rooms.

The two Venetian Chairs come from the South Kensington Museum. They are of walnut wood, partly gilded, and boldly carved with grotesque figures. They were acquired by the museum authorities from the Soulagé Collection, at a cost of £10 and £15 respectively, and date back to the 16th century.

## THE SURVEYORS' INSTITUTION.

**A**T the ordinary general meeting, held on Monday last, a discussion took place on Mr. Channing's new Bill for amending the Agricultural Holdings Act of 1883. Several members took part in the discussion, the consensus of opinion being that the Bill, if carried, would be, at best, useless or unworkable, or more probably mischievous, as tending still further to restrict freedom of contract between landlord and tenant, in the case of agricultural leases.

Mr. W. Wright, speaking as a Midland County land agent, did not believe there was any demand among the tenants for new legislation, or for any interference between them and the landlords, as between man and man each bent on carrying on his business with convenience and profit to himself. All that both parties wished was to be let alone to carry out their own contracts.

Mr. Sanday, speaking as a member of a firm of land agents, whose practice extended from Lancashire to Hampshire, agreed that there was no general demand among the tenants for new legislation. The appointment of official arbitrators to fix rents, out, as he thought, at the root of all freedom of contract. Why should the rent of land be the only thing to which a judicial value might be fixed? He was sure that neither landlords nor tenants desired the change.

Similar sentiments, based on practical experience, were expressed by Mr. W. R. Eve, Mr. H. Cobb, Mr. F. Austen, and other members, and the President (Mr. R. Vigers), in summing

up the discussion, gave it as his opinion that, if the legislation now proposed were to follow the lines of that already existing in Ireland, the result would be as disastrous to agriculture in this country, as from his experience he knew it had proved to be on the other side of St. George's Channel.

## FIRE-TESTS WITH GLASS.

**A** REPORT of the British Fire Prevention Committee's official test on three casements glazed by the British Luxfer Prism Syndicate, Ltd., is instructive, as showing how certain methods of glazing will withstand very severe fire tests and the application of water without breaking away or allowing the glass to fall out. The report describes in detail the manner in which the glazing in question was tested. The special method of glazing adopted by the British Luxfer Prism Syndicate, we very lately described. Any glass, plain, prismatic, plate, can be used. The importance of the investigation is to be found in the fact that by this method of glazing there is no necessity for shutters or blinds to window openings, and that in case of a fire breaking out within a building it will be practically confined within the walls, and that those engaged in rescue or fire extinction are not imperilled by the bursting out of flames through cracked glass or inflammable sashes. The report describes the construction of the testing chamber, which was built of stock bricks and lime mortar 10ft. square internally, and was 7ft. 5in. in height. The ceiling was of wood joists and beams placed side by side to make a solid soffit. The fuel used was gas, regulated by valves, and two Roberts-Austen pyrometers were introduced in recording the temperatures. The Luxfer prisms were electro-glazed, built into teak casements. The duration of the test was 30 minutes, and in the first 15 minutes the temperature was gradually raised to 1,000° Fahr., after which water was turned on to the outside of prisms for two minutes; then for 15 minutes the temperature was gradually increased to 1,500° Fahr. At the expiration of this period water was to be applied on the inside three minutes. Three casements were tested, each of them 3ft. by 4ft. clear glazing. The result of the test is thus summarised. The Luxfer prisms of 4in. square remained in position, while the

whole area of glazing began to bulge inwards to the extent of 1in., 1½in., and 2½in. respectively after 12 minutes. In 21 minutes the top part of the centre casement left a space between the glazing and the teak frame; 317 squares out of the 324 withstood the action of fire and water, except being cracked, and the remaining seven squares were broken. The glazing was left intact. The teak casements were charred to a depth of about ¾in. on the inside. Plans and sections of the testing-chamber and details of the Luxfer Prism plates are shown as fixed to teak frame. The detailed observations of the test, and the photo-illustrations of the appearance of the three struts after the test had been applied, internally and externally viewed, are given. The report is of practical interest to all interested, and may be obtained at the offices of the committee, Waterloo-place, Pall Mall.

## CHIPS.

The members of the Society of Architects visited the Building Trades Exhibition at the Royal Agricultural Hall yesterday (Thursday) afternoon.

A meeting of art students will be held at 20, Fitzroy-street, W., at 5 o'clock to-morrow (Saturday) afternoon, to determine upon an effective protest against the decorations of Sir W. B. Richmond in St. Paul's Cathedral.

The United Asbestos Co., Ltd., have issued a supplementary catalogue containing illustrations of their new designs in "Salamander" for the present season, which is well worth the perusal of architects and others using this excellent material.

A large hotel is about to be built at St. Mawes, near Falmouth, from plans by Mr. Silvanus Trevall, of Truro.

Bradford parish church has been re-opened after restoration carried out at an expenditure of some £10,000, under the care of Messrs. T. H. and F. Healey, architects, Bradford.

Col. W. R. Slacks, R.E., an inspector from the Local Government Board, conducted an inquiry at Stanground, Peterborough, last week, with respect to an application made by the Norman Cross Rural District Council for leave to borrow £15,500 for purposes of providing a sewage scheme for the three parishes of Fletton Rural, Woodstone Rural, and Stanground. The scheme proposed to be carried out is prepared by Messrs. G. Hodson and F. W. Hodson, engineers, of Loughborough and London, both of whom attended the inquiry in person.

## TWO HOUSES, SOUTHMINSTER, ESSEX.

THIS pair of houses was erected at Southminster, Essex, for Mr. D. Drysdall at a cost of £680 15s., exclusive of drainage. The external walls are of hollow construction, faced with local red bricks with white pressed brick quoins, tile porch, oak posts and entrance gates, and tiled path. Mr. C. S. F. Palmer, A.R.I.B.A., is the architect.

## L. AND N.W.R. GOODS WAREHOUSES.

THE new goods warehouses now approaching completion in Eldon-street and Wilson-street, to the north of Broad-street Station, for the London and North-Western Railway Company, were visited by the members of the Society of Architects on Thursday afternoon in last week. The party were received in the drawing office by Mr. Joseph Randall, of the firm of Messrs. Kirk and Randall, and President of the Institute of Builders, who acted as guide, and Mr. Thomas Kyte, the resident engineer. The buildings form an extension westwards of existing warehouses built for the same railway company some years since at an outlay of £120,000, and will cost over £100,000, exclusive of all cartage of materials and certain provision of ironwork, which is done by the company, and is estimated by them to be worth an additional one-fourth. The buildings have been designed by Mr. Francis Stevenson, M.Inst.C.E., the engineer-in-chief at Euston, assisted by Mr. E. Bayliss Thornhill, M.Inst.C.E., with Mr. Kyte as resident engineer. The contractors for these warehouses and the ones previously erected are Messrs. Kirk and Randall, of Woolwich, represented on the works by Mr. Walter Randall, the general foreman being Mr. Coates. The buildings now in hand cover an area of 223ft. by 212ft., or about  $3\frac{1}{2}$  acres, and consists of four floors in addition to two basements, the height of the stories varying from 15ft. on the ground area to 10ft. at the top. The bricks have chiefly been supplied from Market Harbrough, the stocks coming from Sittingbourne, and blue bricks of special make from Beddowes. Bangor slates and Hartley's ribbed glass are employed for the roofs. Of the ironwork some 2,000 tons were supplied by Messrs. Cochrane and Co., of Dudley; the rolled joists by Messrs.

Dorman, Long, and Co., of Middlesbrough; the steel roofing by Messrs. Kirk and Randall; while the smaller lifts and machinery and many details were prepared at the railway company's works at Crewe. The foundations are carried to a depth of 40ft. below the sub-basement, and rest on a bed of solid concrete; in this are set monoliths of Darley Dale stone, each 9ft. square, and from 2ft. 6in. to 3ft. thick, weighing 15 tons each, on which the main piers are borne, and Mr. Randall mentioned that his firm paid a bonus of £5 for each of these stones to have it quarried and delivered at the specified time, so as to avoid delay in carrying out the work. There are two lines of railway carried—one at the ground floor, the other at the first-floor level, through the buildings from the adjoining yards and warehouses, and in addition to a staircase of stone provided at either end of the warehouse, there are two lifts, capable of carrying loaded trucks, one 35ft. and the other 25ft. square, communicating with every floor, and supplied by Messrs. Tannett and Walker, of Leeds. The necessary power for working these lifts and the transport of goods is provided from the hydraulic mains from the works in Worship-street, belonging to the company, and already utilised for the older warehouse. The lighting throughout is by electricity, on the incandescent system, no gas being introduced into the building. The work throughout, as might be expected, is exceedingly plain, but substantial, and the interest of visitors centred in the precautions taken against the outbreak and spread of fire. The floors throughout are of concrete, granite chippings and Portland cement, in the proportion of two to one, strengthened by internal ironwork, and faced on the surface with a solution of silicate of soda, which penetrates to some depth, and will form a wear-resisting surface. The only wood introduced to the outer doors is poplar, which is even more fire-resisting than teak. The flaps in floors for hoisting goods are of this wood, protected on the upper surface by a sheeting of iron. These leaves run on rollers, and are counterpoised by weights secured by cords which would snap, automatically closing the aperture, should the heat exceed 130° Fahr. All the steel girders and piers on the lower floor are inclosed in iron netting, with a coating of Canadian asbestos and plaster. Along

the surface of every ceiling runs a network of mains, provided with automatic sprinklers, operated by fusible plugs which yield at a temperature of 155°. These mains are charged from a tank placed in the brick tower which rises above the main level of the warehouse near the south-east angle. The floors are calculated to bear a working load of 4cwt. to the foot, while the actual strain on the steel girders is estimated at  $7\frac{1}{2}$  tons and on the rolled joists at 6 tons. The roofs have caulked joints with cast-iron gutters; but in reply to a question Mr. Randall stated that if the work had to be done again lead would be used for the gutters. At the close of the visit a hearty vote of thanks was accorded to Mr. Randall for kindly acting as cicerone, on the motion of Mr. Ellis Marsland, hon. secretary, seconded by Mr. J. R. Manning, member of Council of the Society.

The memorial-stones of the John Pennington Primitive Methodist Mission Hall were laid at Fell-side, Kendal, on the 21st inst. Mr. John Thomson is the architect.

The Bishop of London will lay the foundation-stone of the new school and technical institute of Sir John Cass's Foundation in Jewry-street, Aldgate, on Wednesday next, May 10.

At the last meeting of the Cranbrook Rural District Council, the plans for the sewerage and sewage disposal for the district of Hawkhurst, prepared by Messrs. Sands and Walker, civil engineers, Nottingham, were approved.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied some of their patent Manchester grates to the Royal Albert Edward Infirmary, Wigan.

The Ripon and Wakefield Diocesan Training College at Ripon has been enlarged at a cost of more than £9,000. The new buildings, which include a chapel, hostel, lecture-room, laboratory, &c., will be dedicated and opened on Monday next.

Operations were commenced last week, in connection with the widening of the Tweed Bridge, Peebles. The plans have been prepared for the Commissioners by Messrs. M'Taggart, Cowan, and Barker, C.E., Glasgow, and the contractors are Messrs. Dickson and Clyde, Peebles, their tender being £5,454 7s. 6d. The bridge as widened will be 40ft. between parapets, the present width being 21ft. The bridge was last widened in 1834.

## HORSE PARADE IN BATTERSEA PARK.

FEW firms connected with the Building Trades have more effectually mastered the secret of securing good service from all in their employ—and that means prompt and careful attention to customers' wishes—than the old-established house of Eastwood and Co., Limited, of Belvedere-road, Lambeth, which, under the management of Mr. George E. Wragge, has during the past few years developed to so gratifying an extent.

A most interesting inspection and parade of cart-horses, vans and carts belonging to the firm was held last Saturday at 11 a.m. in Battersea Park, by the kind permission of the London County Council. The prizes offered varied from 10s. downwards, and the points of merit were the perfect grooming of the horses, well-kept harness, and well-kept vehicles. The judges for the horses were Mr. Sulman and Sergt. Redding; for the harness, Mr. Bristowe and Mr. Howard; and for the vehicles, Mr. Townsend and Mr. Bines. The umpire was Mr. Henry J. Byrne, who is always the zealous seconder of the fruitful suggestions of the energetic managing director of the firm, Mr. George E. Wragge, for the encouragement of healthy emulation. Mr. Lawson, the principal wharf manager, was no less active; and, thanks to the co-operation of these gentlemen, the awards were promptly made. The prizes were distributed as follows:—For Pair-horse Vans: 1st, John Dedman (38 years in the employ of the firm); For Single-horse Vans: 1st, Causton (24 years' service); 2nd, Sharp (17 years' service); 3rd, Hine (15½ years' service); 4th, Mayhew (11 years' service); 5th, Christmas (5 years' service); 6th, Pegg (1 year's service). Four Light Vans: 1st, Dark (14 years' service). After the announcement of the prizes, the horses and vehicles, nearly 80 in number, formed a procession, and, leaving the park, proceeded over the Victoria Bridge, and by the way of Sloane-street, back through the West-end to Northumberland-avenue, where each section broke off for its own headquarters—some at Greenwich, and some at Lambeth, Southwark, Woolwich, Chelsea, &c.

## THE HOLBORN-STRAND NEW THOROUGHFARE.

AFTER a fortnight's consideration and the examination of many professional witnesses, the select committee of the House of Commons has passed the preamble of the London Improvements Bill, providing, among other works, for a new street from Southampton-row, Holborn, to the Strand, subject to the following conditions:—"That the preamble is proved so far as regards the Strand and Holborn improvements; that the land south of the Strand be excluded from the betterment area, also the property of the *Financial Times*; that the number of years in which betterment may be proved be limited to ten—namely, seven for works and three for improvement; that the Danes Inn property remain as proposed in the Bill; that the making of the road remain in the hands of the County Council. It is not proposed to insert in this Bill section 133 of the Land Clauses Act, but that the Sardinia-street works of the Metropolitan Electric Supply Company be reinstated in such a way that there be no interference with the business, and on such a site as will protect them from any proceeding for making a nuisance. With regard to Clause 20, the committee think some Government authority should give a certificate of approval before property is taken under the valuation provided under section 21 of the Housing of the Working Classes Act, 1890."

A receiving order has been granted in the case of John Alfred Langston, of Lonsdale-square, Barnsbury, N., late Took's-court, Chancery-lane, W.C., architect.

The Leigh (Lancashire) rural district council have selected Mr. Thomas W. B. Gent, of Bolton, out of 37 applicants to be their first surveyor, at a salary of £180 per annum.

The Select Committee of the House of Commons have considered the North-West London Railway Bill, under which power is sought to construct an underground railway to be worked by electricity, connecting the Marble Arch with Cricklewood. It stated that the line would be four miles long, and would have intermediate stations at Maida Vale, Kilburn, and Brondesbury, and was estimated to cost £1,065,183, or about £450,000 a mile. The Committee passed the preamble.

## OBITUARY.

THE death took place on Tuesday of Mr. ARCHIBALD PAUL BREVITT, architect, of Wolverhampton, and brother of the town clerk of the borough. The deceased, who was fifty-nine years of age, has been in ill-health for a considerable period. He served his articles with Mr. Taubshaw, of Stafford, and commenced practice at his native place, Darlaston, removing about fifteen years ago to Wolverhampton. He married a daughter of the late Rev. J. Y. Rooker, vicar of Lower Gornal, who survives him.

## CHIPS.

A new illuminated turret clock has been erected for the London City and Midland Bank, Carlisle, by Messrs. W. Potts and Sons, clock manufacturers, Leeds and Newcastle-on-Tyne, under instructions received from Mr. J. Taylor Scott, F.R.I.B.A., architect, Carlisle. Messrs. Potts and Sons are also making the new clock for Heaton Park, Newcastle-on-Tyne, for the Birkett Memorial Committee.

At the last meeting of the Edinburgh Architectural Society a paper entitled "Minor Points in Practice" was read by Mr. J. Fairweather, of Glasgow. Mr. A. Greig, vice-president, was in the chair. The lecturer confined himself to practical points on materials and constructions, and dealt with true and false economy in building operations at some length.

The Queen's Hotel, on the north side of Leicester-square, was opened last week. It is Italian Renaissance in style, and erected on the site of the old Hôtel de Paris. There are five stories, and fifty bedrooms. Within the hotel is a Masonic temple, with a dining-room adjoining. Messrs. Saville and Martin were the architects.

Mr. R. Pawley, of Hull, who was selected by the Bristol Docks Committee to fill the gap caused by the death of their late engineer, Mr. McCurrah, has decided not to go to Bristol, but to continue his duties as sole engineer to the Hull and South Yorkshire Railway Company, for whom he is about to carry out an important extension of the Alexandra Dock at Hull. The Docks Committee have therefore appointed to the post Mr. William Wilkinson Squire, M.Inst.C.E., until November last chief engineer to the Bombay Port Trust, under whom he had served 17 years. Mr. Squire is 44 years of age.

At Toddington, near Dunstable, a new town-hall was opened last week. It contains an assembly-room seated for 200 persons, and two committee-rooms. Mr. Muckleston, of Toddington, was the builder.

The memorial-stone of a technical institute in course of erection in St. George's-street, Norwich, was laid with much civic ceremony last week. The institute is being built from plans by Mr. Arthur E. Collins, the city architect, the contractor being Mr. S. Warburton, of Norwich.

A Select Committee of the House of Commons has passed the preamble of the Great Northern and Strand Railway Bill. The line will extend from Wood Green to opposite Somerset House in the Strand, will be 6½ miles in length, and is estimated to cost £2,300,000.

At a special meeting of Paisley Town Council on Friday, Mr. James Lee, Stanley G-reen Farm, Paisley, was elected to the vacant post of Master of Works by 13 votes to 10 for Mr. Stewart, Edinburgh. Mr. Lee is 35 years of age, and for the past ten years has been employed in the Glasgow Gas Corporation department under Mr. William Foulis, C.E. He has acted as resident engineer for much of the work carried out by the Gas Trust. The salary is £350.

At Kew Parish Church, on Sunday, a stained-glass window, erected to the memory of the late Duchess of Teck, was dedicated. The window comprises two main lights. In the northern is a life-size representation of St. Peter holding the keys, and beneath this is depicted the giving to him of the commission recorded by St. Matthew. In the southern light are represented St. Paul's conversion and the Apostle holding the word of Life and the sword of the Spirit.

In the early days of the typewriter prejudice in official circles against its use was extreme, notwithstanding the undoubted advantages to be derived from it. The appearance, however, of the elegant, light, and compact Yost, with its beautiful characters and wonderful ink-pad, was the signal for the abolition of this adverse feeling. Shortly after it was put on the English market it was adopted by the Emperor William, the King of Wurtemberg, the Emperor of Austria, the Duke and Duchess of York, and many other members of royalty and aristocracy. The latest addition to the list of eminent users of the Yost Typewriter is President Loubet, who is loud in his praises of the best of modern writing-machines.

## COMPETITIONS.

BRADFORD.—Lord Masham visited Bradford on Tuesday to approve the plans for the Masham-Cartwright Memorial Hall, towards the erection of which, in Lister Park, Bradford, he has contributed £40,000. His lordship approved the selection made by the assessor, Mr. Alfred Waterhouse, R.A., and the awards for the plans were announced as follows:—First prize (£150), Mr. J. W. Simpson and Mr. J. Milner Allen, 10, New Inn, Strand, W.C.; second prize (£100), Mr. A. R. Jemmett, 21, Great College-street, Westminster; third prize (£50), Mr. W. A. Pite and Mr. R. S. Balfour, 3, Upper Montague-street, W.C.

GRAMMAR SCHOOL HOUSE, DONCASTER.—Mr. Alfred Aitchison, of Messrs. Roumieu and Aitchison, A.A.R.I.B.A., Law Courts-place, Strand, W.C., was appointed by the R.I.B.A. to adjudicate upon the designs sent in competition for the Grammar School. The first prize of £50 is awarded to Messrs. R. and W. Dixon, architects, Barnsley, Yorkshire; the second prize to Mr. J. B. Royle, of 340, Green-lanes, Finsbury Park, N.; and the following were honourably mentioned:—Messrs. Seward and Rawcliffe, of Preston; Mr. L. H. Dutch, of 5, John Dalton-street, Manchester; Messrs. Taylor and Son, of Aylesbury; Mr. James Withers, of West Bromwich; Mr. F. W. Edwards, Newhall-street, Birmingham; and Messrs. Sharpe and Quail, of Old Trafford, Manchester.

SHOREDITCH TOWN HALL.—The Shoreditch Vestry were informed on Tuesday by the Town Hall Committee that only four sets of designs had been received for the proposed extension of the present town-hall buildings. The committee placed as first in order of merit design No. 2; and as second, design No. 3; and they recommended the vestry to confirm that award. The opening of the sealed envelopes showed that the author of No. 2, awarded the first premium of £50, was Mr. W. J. Hunt, 12, Bedford-gardens, Kensington; and of No. 3 design, to whom the second premium of £25 was given, was Messrs. Spalding and Cross, of Cheapside. The author of No. 1 design was Mr. Charles Bell, of Cannon-street, and of No. 4 design, Mr. C. E. Jackson, of 39, Wigmore-street. The vestry left for future consideration the question of a final selection of the design for the extension of the town hall.

The London County Council resolved, on Tuesday, to build a tunnel between Rotherhithe and Shadwell at a cost of 2½ millions, and also agreed to contribute £50,000 to the widening of Lower Thames-street, the City paying the other three-fourths necessary.

Ings parish church has been fitted with the latest improved "small tube" hot-water heating apparatus by John King, Limited, engineers, Liverpool, employing their well-known special economical coil-heater with waterway firebrass.

The supply of properties at Tokenhouse-yard Auction Mart last week was smaller than in the corresponding week of the last two years, but the prices realised were satisfactory. There was a total realisation of £204,709. The principal private treaty sale of the week was that of the Chalkwell Hall Estate, near Southend-on-Sea, with over half a mile of sea frontage, and comprising 262 acres, for £100,000, the purchaser being Mr. E. E. Raynor, of London.

Mr. Justice Day and a special jury heard last week a libel action brought by Mr. James Sanders, builder, and the mayor of South Molton, Devonshire, against his cousin, Mr. William Sanders, sen., a builder of the same town, for alleged libel. The matter complained of was published on a placard when the plaintiff was a candidate for a vacancy on the Devon County Council, and referred to several acts of his in connection with local questions. The defendant pleaded justification, but on the second day of the trial he withdrew any imputations he might have made on plaintiff in the heat of political controversy, and the case was settled out of court.

The Marlborough College Mission having built St. Mary's Church and Vicarage at Tottenham, are now completing their scheme by erecting a parochial building, consisting of a church hall, men's club-house, and caretakers' cottage, the memorial-stone of which was laid by H.R.H. the Duchess of Albany on Saturday afternoon, the dedication service being laid by the Bishop of London. The whole group of buildings is from the designs of Messrs. Cutts. The Duchess takes a great interest in this mission, the late Duke having been a governor of Marlborough College.

## Building Intelligence.

**BANSTEAD CHURCH.**—The restoration and repairs which have been in progress for the last nine months are now completed. A clerestory has been formed over the nave arcade of six 3-light traceried windows filled with leaded lights; the roofs have been stripped, repaired, and retiled; the stonework generally repaired, drains relaid, &c. Through the liberality of a parishioner the interior has been beautifully decorated with frescoes. Mr. F. J. Shopland, contractor, of Sutton, carried out the restoration and repairs to the fabric, the decorative work being done by Messrs. Heaton, Butler, and Bayne, under the superintendence of Mr. J. Hatchard Smith, F.R.I.B.A., 41, Moorgate Station Buildings, E.C.

**SHIRLEY, WARWICKSHIRE.**—The church of St. Patrick was reopened on Friday, having been almost entirely rebuilt. The only existing portion of the previous church, which was erected half a century ago, is the tower, a new nave and chancel having been built. The architect is Mr. W. H. Bidlake, M.A., of Birmingham. The church is Gothic in style, and is built of red brick with stone facings. Messrs. Smith, of Leamington, were the builders. The interior will accommodate nearly 300 people.

### CHIPS.

The partnership heretofore existing between J. W. Cobb and W. Bottrill, practising as architects, at Trafalgar Buildings, Northumberland-avenue, W.C., under the style of Cobb and Bottrill, has been dissolved.

The partnership hitherto existing between Mr. J. S. Gibson and Mr. S. B. Russell, architects, has been dissolved. Mr. Gibson will continue to practice at No. 4, and Mr. Russell at No. 11, Grays' Inn-square, W.C.

An inquiry was held on Friday by Colonel Hepper in connection with the application of the St. Marychurch District Council for £7,700 for sewerage. Mr. Worth, C.E., the engineer for the scheme, explained the proposals.

At Earldown, Coventry, a new coffee-house and public-hall were opened on Saturday. The building has been built at a cost of £1,700, and contains a hall for 350 persons, eight beds, and the usual coffee tavern accommodation. Mr. T. G. Golby, of Coventry, was the builder.

At the Edmonton Free Library, on Saturday afternoon, Mr. Frederick Harrison, M.A., performed the ceremony of unveiling two medallion portraits of Charles Lamb and John Keats, to whom the library had been erected by Mr. J. Passmore Edwards as a memorial. Lamb died and was buried at Edmonton, and Keats spent a part of his life there. The tablets were executed by Mr. George Frampton, A.R.A.

Col. J. T. Marsh, R.E., held a Local Government Board inquiry at the offices of the East Dereham Urban District Council on April 27, relative to an application for permission to raise a loan of £2,350, for the purpose of making additions and alterations at the Waterworks.

At Thetford, last week, a new road, 1,320 ft. long and 28 ft. wide, connecting the Norwich and Croxton main roads, was taken over by the town council. It forms a shortened route from the Norwich-road to the railway-station, and will eventually be lined on either side by the landowner with houses, opening out a new district for building.

The result of the voting of the ratepayers of Newcastle-on-Tyne on the corporation Bill for the construction of tramways and the carrying-out of certain improvements has been made known. The corporation resolved to ask power from Parliament to make tramways at a cost of £400,000, and to carry out other works—chiefly street improvements—which were to cost £770,000. They resolved also to work the tramways themselves. Forty thousand voting papers were issued, and the result was declared as follows:—For the Bill, 12,633; against the Bill, 11,416. More than 7,000 voting papers were returned blank.

The Bishop of Coventry has just consecrated a portion of Brandwood End Cemetery, a new burial-ground which has been acquired and laid out by the King's Norton and Northfield Urban District Council. The area of the burial ground covers 31 acres 2 roods, of which twelve acres have been left for future extension, and five acres remain unappropriated. The cost of the land was £6,800, the fencing, laying-out, &c., £3,900, and the buildings £6,000. The principal buildings are two chapels (English Decorated in style), situated about the centre of the ground. Mr. J. Brewin Holmes was the architect.

## PROFESSIONAL AND TRADE SOCIETIES.

**THE ARCHITECTURAL ASSOCIATION.**—The fortnightly meeting of the Association was held on Friday evening, the President, Mr. G. H. Fellowes-Pryne, in the chair. Mr. A. E. Nightingale was reinstated as a member. A cordial vote of thanks was proposed by acclamation to Messrs. G. B. Carvill, Gervase Bailey, and Leonard Butler, the authors and composers of "The Archdruids Elect," the burlesque presented at the *soirée* a week previously, and the thanks of the members were also accorded to the Prime Wardens, to Mr. Howard Chatfield Clarke, and Mr. J. D. Crace for facilities recently granted the members to visit and inspect Fishmongers' Hall. In reference to the house list of nominations for next session's council and officers, the President announced that one fresh nomination had been made, Mr. E. W. M. Wonnacott having been nominated by Messrs. J. W. Stonhold and C. H. Freeman as librarian, and Messrs. W. A. Jeckells, A. Smithers, and W. A. Webb were appointed as scrutineers. A paper on "Specifications," written by Mr. F. W. Macey, was read, in the absence of the author, by Mr. G. B. Carvill, hon. secretary, and will be found on p. 602. At the close a short discussion took place, in which Messrs. Henry Lovegrove, F. T. W. Goldsmith, B. F. Fletcher, C. H. Brodie, Max Clarke, G. M. Nicholson, and the President took part, and thanks were accorded to the author and reader of the paper.

**NORTHERN ARCHITECTURAL ASSOCIATION.**—In the annual report for the fortieth session the council again record the increasing success of the association. During the session, since the last annual report, one member, nine associates, and fourteen students have been elected, and there are now 50 members, 59 associates, and 44 students, making a total of 153 on the roll. The association records the death of Mr. W. Livesey, who joined the association as a member in 1879. At the last annual meeting Mr. Frank W. Rich, F.R.I.B.A., was re-elected president, and during the meeting prizes were presented to Mr. A. K. Tasker and Mr. E. E. Shepherd, the successful students competing for the best sets of drawings as required by the R.I.B.A. for their intermediate examination. The finances were in a satisfactory condition, there being a balance in hand of £32, and the library is doing useful work. Meetings have been held for the discussion of papers and excursions made during the session.

**THE GLASGOW INSTITUTE OF ARCHITECTS.**—A special meeting of the council of this institute was held on April 28 at 115, St. Vincent-street, under the chairmanship of Mr. David Barclay, F.R.I.B.A., president, to consider the principle of the Bill recently introduced into the House of Lords by Lord Russell of Killowen relating to illicit commissions. The President stated that one of the objects of the institute is to insure that the business carried on by its members would be free from anything dishonourable, and that they welcomed any action, through such a Bill or by any other means, which would insure fair trading in business and honourable dealing amongst all professional men. The following resolution was then unanimously passed:—"That the council of the Glasgow Institute of Architects, in the interests of honest trade, and to show its disapproval of illicit commissions in whatever form, resolves to support the principle of Lord Russell's Bill."

New Sunday-schools in Vine-street, Coventry, were opened on Wednesday week. Mr. C. Haywood, of Coventry, was the builder.

Archdeacon Sheringham, of Gloucester, makes an appeal for £1,200 more to preserve Tewkesbury Abbey, "the noblest church in England," from impending disaster. Nearly £1,700 has already been expended, and an effort is being made "to renew decayed roofs and sodden walls."

The town-hall in Kensington High-street, built ten years ago from plans by the late Mr. Robert Walker, has been enlarged by extensive additions to the back, and was reopened by Lady Mary Glyn yesterday (Thursday). The alterations have been carried out by Messrs. Leslie and Co., builders, of Kensington-square, from plans prepared by the joint architects, Mr. W. Weaver, M.I.C.E., surveyor to the vestry, and Mr. W. G. Hunt, of Bedford-gardens, Kensington. The cost of the site was £6,728, and the contract price of the building was £13,747. Another £2,000 will have to be spent on furniture and fittings before the scheme is completed.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

RECEIVED.—J. M. and Son.—W. B. G.—A. W. K. Co.

"BUILDING NEWS" DESIGNING CLUB.

EIGHTH LIST OF SUBJECTS.

H.—A Golf Club Pavilion for links near the sea on a flat site, well protected from the north by a belt of trees and high ground. The general room to be 30 ft. by 26 ft., and a small bar parlour with counter, leading out of the entrance-hall lobby, and opening by a doorway into the club-room. There is to be a ladies' room about 18 ft. by 14 ft., with separate entrance lavatory and w.c. Provide a club dressing-room 14 ft. by 12 ft., and a drying-room adjoining, as well as a lavatory, urinals, and w.c. On the first floor there is to be a luncheon-room 30 ft. by 18 ft., with covered balcony 12 ft. deep on the S.W. side, partly projecting over the front wall below and carried by brackets, not posts. The room for committee to be on this floor. A club kitchen and a bedroom to be contrived for an attendant and his wife. Materials: red brick, stone, and timber, with tiled roof. The front to face south-west. Scale 8 ft. to the inch. Sketch view to be included. The plans, if necessary, may be shown to one-sixteenth scale.

DRAWINGS RECEIVED.—"Hoopoe," "Quadrant," "Ulk," "Levenach," "Oak," "Swan," "Arc."

## Correspondence.

THE NEXT PRESIDENT OF THE INSTITUTE.

To the Editor of the BUILDING NEWS.

SIR,—It is all very well for Mr. Woodward to object to the writers of the correspondence on this subject because they have not proclaimed their identity, and, after all, it is the pertinence of what people say which is of importance, and not so much who they are. The real difficulty of effectively withstanding the Council in their continued determination to keep the administration of the Institute entirely in their own hands, of course consists in the chronic apathy of the members as a body. I am confident of this, however, that a large number of men would be only too glad to co-operate in a serious endeavour to mend matters and help to invest the policy of the Institute with more vital energy if only a leader could be found of impartial and catholic views determined to upset this "corner" which too long has kept things close, giving no chance to anyone unacceptable by the clique in power. Men whom I know personally on the Council have told me how hopeless it is to attempt any reforms, and how soon they realised the impossibility of emancipating the Institute from its dead-and-alive existence. It seems too much to expect Mr. Emerson to withdraw, and, having secured a majority on the Council, no one is likely to come forward to contest the election against him. Mr. Woodward suggests that the candidate has only done work in India, but Mr. Emerson has built some admirable works in England, notably the red-brick and groined church of St. Mary in St. James-street, Brighton. He commenced St. Mary's Hospital at Paddington, besides some houses at the West-End, and at Turnham Green. It is now nearly 30 years since he left India. He was the favourite pupil of the late William Burges, A.R.A., and we all remember what Burges thought of the Institute!

If there is no chance—and I see none—of obtaining a really popularly-elected president this year, do let us accept the legal nominee of the Council with a good grace, and help him with our loyal support to signalise his term of office, if not with striking reforms, at any rate by a more open-handed way of doing things all round. You may be very high and very clever in snubbing people; you may work in all your own set; but this style of conducting a chartered body can only end one way. You can see it illustrated at Conduit-street any day.—I am, &c.,

PAX.

RESTORATION WESTMINSTER ABBEY  
W. FRONT.

SIR,—Your correspondent "An Antiquarian Architect" might, without loss of dignity on his

part, have ascertained Mr. Micklethwaite's connection with the restoration now proceeding at the west end of the Abbey, before so hopelessly involving himself as he does in his letter.

I am in a position to know that the work on the buttress at the west end was commenced under the direction of Mr. Pearson, and at the time of his death was nearing completion. Consequently Mr. Micklethwaite never had anything to do with it, nor, as a matter of fact, has he now. —I am, &c., F. C.

#### CHURCH OF THE SACRED HEART, MONTMARTRE.

SIR,—Mr. Hems is in error, I think. Was not this church designed by the late M. Abadie, whose instructions have been carried out with slight modifications? The best view is obtained from the higher ground at the end of the Boulevard Magenta.—I am, &c., A. NEEDHAM WILSON, A.R.I.B.A.

### Intercommunication.

#### QUESTIONS.

[12232.]—**Damp Basement.**—The basement of a large suburban house near London is very damp; the sub-soil is dense clay, the floor brick on edge. Is there any material that can be applied to the walls inside, and that will adhere to the walls, and what is the best plan to proceed?—PUZZLED.

[12233.]—**Obstruction in Lead Pipe.**—A trapped lead waste-pipe from lavatory basin on first floor discharges into eastern head at top of iron down-pipe, which latter empties on to the top of a trapped gully at yard level. About every 18 months the lead pipe becomes choked, and a plumber has to be called in to remove the obstruction by means of a force pump. The deposit consists of a black jelly-like substance. Both warm and cold water are used in the lavatory, and for the most part "hard" supplied from the town main. Is the obstruction a coating of salts of lime deposited by the hard water over the inner surface of the pipe? If so, how can it be prevented? Could any chemical be occasionally poured down the pipe to dissolve the coating in the pipe without injuring the latter or the lavatory basin? Any information would be gratefully accepted.—ASSISTANT.

[12234.]—**Damp Room.**—Can any of your correspondents give suggestions for improving a room which is at present damp? The room in question is on the basement floor, and used as a sitting-room. When built, it was not intended as a sitting-room, but as a cellar, hence the damp-course is above the floor. We have recently built an area wall outside; but this does not seem sufficient. The floor of the room is cemented, and also the walls inside to about 4ft. high. The soil is red clay, and therefore retentive of damp. Suggestions for making this room dry will very much oblige.—BRISTOL.

[12235.]—**Strength and Durability.**—It is stated by an authority on building stones that "the compressive strength of a stone, though it may reach many thousands of pounds to the square inch, may be found to bear no relationship yet recognised to qualities concerned in durability." The same writer says the resistance of a stone to atmospheric attack is largely modified by climate—uniform conditions of climate and temperature are favourable to stones of low and high compressive strength. Have these facts been confirmed as regards our ordinary building stones? If so, the architect in selecting a durable stone would have to consider the constituent minerals contained rather than the resistance; in other words, according to these statements the least resisting stone to pressure the better it may be as a weathering stone. Can we wonder at the mistakes of architects in selecting building stones under these circumstances?—STUDENT.

[12236.]—**Workmen's Compensation Act.**—Would an architect be liable under the Workmen's Compensation Act for an accident to his pupil taking place upon a building in course of erection, the said pupil being sent in the ordinary course of his duties to make an inspection, but not being in receipt of any salary or wages? Would he also be liable for an accident to an assistant under similar circumstances, the said assistant being in receipt of salary?—A. M. A.

[12237.]—**Wall.**—Can any reader inform me the way of working out the following? A rectangular wall, 1 ft. high, has to resist a thrust of 500lb. per foot run applied at an angle of 60° to the horizon, at a height of 8ft. above the ground level. Taking the weight of wall at 100lb. per foot cube, what must be its thickness, supposing it to be unstable, without taking into consideration the strength of the mortar?—LEWIS KABERRY.

#### REPLIES.

[12227.]—**French Concrete Piles.**—I should recommend Mr. Dowling to write to Mr. L. G. Mouchel, Britonferry, South Wales, for the information he requires respecting these; or if he will write to me at General Post Office, Southampton, I would communicate with him. A quantity of these piles have been driven in this neighbourhood with excellent results.—A. J. A.

[12228.]—**Louvre Chimney-Pots.**—My attention has been called to the question in your issue of the 21st ult. by Mr. Frank Marriott as to who invented the Louvre chimney-pot. I thought someone who remembered the incident would have answered this question instead of my being called upon to speak for myself. About 30 years ago, when foreman for Messrs. W. Bailey and Sons, 71, Gracechurch-street, E.C., the writer designed the Louvre chimney-pot, and had the first one made in copper. One member of the firm (viz., Mr. H. Bailey) is still living, and will, I have no doubt, remember and be

able to confirm the fact.—ROBT. CHAM, Consulting (Domestic) Engineer, 143, Cannon-street, E.C.

[12228.]—**Louvre Chimney-Pots.**—I think it was at the exhibition in South Kensington in 1862 that I saw the model a man named Cosser, a builder and carpenter, York-road, Lambeth (his mother carried on the business of her deceased husband, who died 40 or 50 or more years ago) made a small model, and I think registered it about the year 1861. I saw it in a shop next door to a scale-maker's. The eldest son, Frederick, who took the business, left some time back. If he is not dead he would be between 60 and 70, and the premises are now, and have been for two or more years past, dining-rooms. I do not remember anything of the sort at the 1851 Exhibition.—REGENT'S PARK.

[12229.]—**Mastic.**—Brick, burnt clay, or limestone, powdered, mixed with oil and litharge, or some other drier. The best was called Hamelin's mastic, but it has been superseded by Portland cement, latter being cheaper. REGENT'S PARK.

#### PARLIAMENTARY NOTES.

THE DECORATION OF ST. PAUL'S CATHEDRAL.—Earl Wemyss has asked her Majesty's Government whether they could put a stop to the decorative destruction of St. Paul's Cathedral that was now going on apace under the orders of the Dean and a committee of taste; and whether, if this were beyond their power, they would take such legislative action as would save our other cathedrals from the possibilities of a like evil fate. Lord Salisbury had no answer to give to the first question except an absolute negative. The Government had no authority and no power over the management of the structure of St. Paul's Cathedral or of any other cathedral. It had been said that the ultimate decision of the question would rest with the Judicial Committee of the Privy Council, but everybody must admit that the duties of that body were sufficiently extensive already. With regard to the second question, the state of public business in the other House was not likely to be such as to enable the leader of that House to undertake legislation upon so thorny a question. Lord Kimberley thought the Dean and Chapter of St. Paul's ought to pay more attention than they had done to the memorial presented by a body of men who had, he considered, the right to express an opinion concerning the decorations.

NATIONAL MONUMENTS IN CHURCHES BILL.—In the House of Lords last week, the Earl of Camperdown moved the Second Reading of this Bill, the object of which he said was to provide that where Parliament had contributed, either wholly or partly, to the construction of a national monument in our cathedrals and national churches, it would not be possible for that monument to be altered or removed without the assent of her Majesty, and without Parliament being informed. Viscount Cross, on behalf of the Government, assented to the principle of the Bill. The Archbishop of Canterbury also intimated that there was no objection on the part of the Bishops to the Bill, which was read a second time.

NEW GOVERNMENT BUILDINGS.—Mr. Akers-Douglas, in answer to Mr. Allhusen, said: The designs of Mr. Young and Mr. Brydon, for the new Government buildings, were approved by her Majesty's Government before they were submitted to the House. I have carefully considered the sketch elevation prepared at the suggestion of Lord Wemyss, and I regret that, although externally attractive as a design for a Royal palace, it is unsuitable for Government offices. There would be no useful purpose served in placing this design in the Tea-room unless it is accompanied by a plan and sections showing the nature and arrangement of the accommodation it would provide. In reply to Mr. John Ellis, Mr. Akers-Douglas added: Certain alterations in matters of detail have been suggested, and these suggestions will be carefully considered. Generally the plans have been most favourably received, and I shall proceed with the work without any unnecessary delay.

Linings were granted at the last fortnightly Dean of Guild Court in Glasgow for the erection of property of the value of about £109,000. Of this total, however, about £70,000 was represented by the International Exhibition buildings to be erected in Kelvin-grove Park.

In anticipation of the Wolverhampton Corporation's Bill for the purchase of the existing tramways and the construction of electric tramways passing this session of Parliament, preparations are in progress for the work. The committee have already issued invitations for the supply of 3,100 tons of steel girder tram rails, 915,000 creosoted deal paving blocks, and 12,000 tons of granite setts.

Col. A. J. Hepper, D.S.O., R.E., of the Local Government Board, held an inquiry at the school, Coates, near Cirencester, on Thursday in last week, into an application by the Cirencester Rural District Council, for sanction to borrow money for providing a water supply for the village of Coates. The scheme is estimated to cost £1,757 19s., and by it water will be distributed to the parish by pipes from a well already sunk on the glebe land.

#### LEGAL INTELLIGENCE.

A KENSINGTON APPEAL.—Mr. Arthur Cates (president), Mr. J. W. Penfold, and Mr. A. A. Hudson (legal adviser) sat at the Surveyors' Institute, Strand, last week, for the purpose of deciding an appeal brought against the London County Council by the trustees of the Phillimore Estate, Kensington, under the London Building Act. Mr. Macmorran, Q.C., for the appellants, explained that the trustees of the Phillimore Gardens Estate, Kensington, desired the sanction of the tribunal to a scheme for the laying out of certain streets in Kensington. During his life the late Captain Phillimore, who died in February, 1887, let Moray-lodge, Kensington, for a term of 80 years, together with the land surrounding it, on lease. The leaseholder at once proceeded to develop the estate, and borrowed largely from Captain Phillimore to lay out the land. At the captain's death large sums borrowed by the lessee were outstanding, and became due to the personal estate of Captain Phillimore. These the lessee was unable to meet, and by an arrangement come to with the Chancery Court he was released from his liability under certain terms. Since then the advisability of dealing with the estate and land had been gone into, and, under advice, the trustees had decided to develop it by laying out streets, widening the existing thoroughfares, and erecting properties more marketable as a letting commodity than those at present existing. The plans of the proposed improvements had been submitted to the London County Council, and that body had refused to sanction them. Mr. E. J. A. Balfour, Mr. E. Chesterton, and Mr. William Weaver, chief surveyor to the Kensington Vestry, also gave evidence in support of the appeal. Mr. Seager Berry, for the respondents, said the London County Council refused to sanction the plans because, according to the general scheme, the proposed streets to be formed would not at and from the time of laying-out afford direct communication with the existing streets. The object of the Building Act was to prevent such streets from being formed. The tribunal disallowed the appeal, but made no order as to costs.

ARBITRATION AT TOWYN.—An important arbitration case was concluded on Towyn, North Wales, on Friday. It concerned an action brought by Messrs. Harrison and Co., contractors, Swansea, against the Towyn Urban District Council with reference to the balance claimed by these contractors from the council for constructing a reservoir for water supply to the Aberdovey part of the council's district. Mr. Morgan W. Davies, Swansea, was the umpire. Messrs. Veevers, Harrison, and Torlby, contractors, gave evidence in support of their claim, and the council's witnesses were Mr. T. T. Marks (Llandudno), Mr. E. Evans (Carnarvon), Mr. T. Smith (Towyn, clerk of the works), Mr. W. R. Davies (clerk to the council), and several members of the council. The chief point of contention was as to whether it was a lump sum contract or whether the work should be paid for according to the schedule of prices attached to the tender. The umpire will issue his award in due course.

#### CHIPS.

At a public meeting held at the town-hall, Leicester, recently, under the presidency of the Mayor, it was decided to take steps for restoring the fine parish church of St. Mary, at an estimated cost of £1,500.

Sunday-school premises were opened by the Wesleyans of Wadebridge on Thursday in last week. The work, which has cost £820, has been carried out by Mr. T. Williams and Sons, builders, Wadebridge, the architects being Messrs. Kerley and Ellis, Exmouth.

A peal of five bells, placed in the tower of the parish church of Arbroath, N.B., was rung for the first time last week. One of the bells, the tenor, has been hung some time since; the other four have been cast by Messrs. J. C. Wilson and Co., of Glasgow.

Branch offices are about to be built at the Tramways centre, in St. Augustine's, Bristol, for the Star Life Assurance Society. The building will be from designs by Mr. A. Blomfield Jackson, of London, and the contract has been entrusted to Mr. A. J. Beaven, of Bedminster. The cost will be about £15,000.

The directors of the Burton-on-Trent Artisans' Dwellings Company accepted tenders for the construction of the first block of 40 houses to be erected between Horninglow-road and Wyggeston-street. The land will provide accommodation for 150 cottages when it is fully occupied. The architect is Mr. Thomas Jenkins, 35, High-street, Burton-on-Trent.

On the recommendation of the Public Health Committee, the London County Council passed, on Tuesday, a code of by-laws dealing with the drainage of buildings in the Metropolis.

## Our Office Table.

AFTER many years of discussion, reference, report, amendment, report, reference, and discussion, a code of new building by-laws for Cardiff is so near being issued that the consent of the Local Government Board has been given to the proposals made on behalf of the corporation. The main controversy with the Local Government Board appears to have been over the width of new streets or continuations of existing thoroughfares. In the final settlement the Local Government Board have conceded to the Cardiff Corporation a width of 50ft. in streets not less than 300yds. long and of 60ft. width in continuations of certain specified streets and roads.

THE annual report of the council of the City and Guilds of London Institutes states that there had been a satisfactory increase in the number of students attending the Central Technical College. Of the 240 students in regular attendance 111 were taking the civil and mechanical engineering course, 83 the electrical engineering course, 24 the chemical course, and 22 the special course. At the close of the last session 40 matriculated third-year students were awarded the diploma of Associate. At the beginning of the present session 79 entered the college as matriculated students out of 107 who presented themselves at the examination. The total number of the County Council and other scholarships held by students now attending the college is 41, and these are of the value of £2,200. The number of day students at the Finsbury College during the year was 185, a decrease of three on the previous year, and the number at the evening classes was 760, more than half of whom were occupied as civil, electrical, mechanical, and hydraulic engineers and electricians and their apprentices. Progress had also been made at the South London Technical Art School, where there were 131 students against 118 in the previous year.

THE old offices, No. 20, Temple-street, Birmingham, occupied by Mr. J. A. Chatwin, architect, and by a firm of solicitors, are shortly to be demolished and replaced by a modern building. The offices are a portion of an early Georgian professional residence, which originally possessed a strip of garden extending to New-street. The head of the doorway is decorated with carving, while inside the entrance is a quaint archway springing from fluted pilasters. Some of the lower rooms retain the oak wainscoting of former days, and the balustrade of the staircase is also ancient. Mr. J. A. Chatwin has been the tenant of the upper floor since 1853. The rise in the value of property in Birmingham is illustrated by the fact that a forty-two years' lease of the premises was granted in 1846 at a yearly rent of £85. The land is now worth about £400 a year, or £1 per yard per annum.

PROFESSOR J. B. JOHNSON, of Washington University, St. Louis, has made some interesting tests of the behaviour of iron or steel stirrups, as used for hanging floor-beams from brick walls, when exposed to fire, and finds that, under such circumstances, they soon become red-hot, and then burn their way rapidly through the end of the beam, while, at the same time, they soften and bend down, the result being that the beam drops out of its bearing in fifteen or twenty minutes after the fire reaches it.

The schools built at Hythe, near Southampton, for the Fawley School Board were formally opened last week. Messrs. Mitchell, Son, and Gutteridge, of Southampton, were the architects, and Mr. Cole, of Hythe, was the builder. The buildings include a main room, 60ft. by 20ft., and a classroom for 40 children. The walls are of red brick with stone designs. The cost for the 268 school-places provided was £2,696, or just over £10 per head.

An installation of electric lighting, carried out at a cost of £7,000, was inaugurated last week at the Millwork Infirmary, belonging to the West Derby board of guardians. The system consists of 1,400 16c.p. lamps, run on a 110-volt circuit. The contractor for the building operations was Mr. W. Hall, Liverpool, and for the electrical portions of the installation the following firms:—Engine-room plant, Mr. Scott Anderson, Sheffield; batteries, the Chloride Electrical Company, Manchester; wiring, Messrs. Woodward and Craig, Glasgow. The buildings were designed by Mr. Charles H. Lancaster, of Liverpool, the architect to the board, and the electrical plant is to the designs and specifications of Mr. Thomas A. Miller, Tower Buildings, Liverpool.

## MEETINGS FOR THE ENSUING WEEK.

FRIDAY (TO-DAY).—Building Trades Exhibition, Royal Agricultural Hall. Papers on "Road-Making Materials and Appliances," by J. Patten Barber and H. T. Wakelam, County Surveyor of Middlesex. 4 p.m.

SATURDAY (TO-MORROW).—Building Trades Exhibition, Royal Agricultural Hall. Visit by the Architectural Association. 3 p.m. Papers on "Road-Making Materials and Appliances," by F. Smythe, Surveyor, Finchley U.D.C., and J. W. Bradley, Borough Engineer, Wolverhampton. 4 p.m. Edinburgh Architectural Association. Visit to Peebles. Train from Waverley Station, 2.10 p.m.

MONDAY.—Society of Arts. "Leather Manufacture," Cantor Lecture No. 4, by Professor Henry R. Proctor, F.I.C. 8 p.m. Bristol Society of Architects. "Speculative Builders and their Little Ways," by Frank W. Wills. 8 p.m.

WEDNESDAY.—Carpenters' Hall Free Lectures. "Temporary Structures and Shoring," by Professor T. Roger Smith, F.R.I.B.A. 8 p.m. Society of Arts. "Fruit-Growing in Kent," by George Bunyard. 8 p.m.

THURSDAY.—Society of Arts. "The Revenue System and Administration of Rajputana," by Michael Francis O'Dwyer. 4.30 p.m. Home Arts and Industries Association. Fifteenth Annual Exhibition opens in Gallery of the Royal Albert Hall. 2.30 p.m.

FRIDAY.—Architectural Association. "Soil and Aspect in Relation to the Dwelling House," by Dr. G. V. Poore, L.R.C.P. 7.30 p.m.

SATURDAY.—Northern Architectural Association. Visit to South Shields.

## THE ARCHITECTURAL ASSOCIATION.

MAY 12th.—ORDINARY MEETING, 9, Conduit-street, W. 7.30 p.m. Dr. G. V. POORE, L.R.C.P., on "SOIL AND ASPECT IN RELATION TO THE DWELLING-HOUSE." ELECTION OF OFFICERS for Session 1899-1900.

E. HOWLEY SIM } Hon. Secs.  
G. B. CARVILL }

## CHIPS.

The Norfolk County Council have decided to enlarge the auxiliary lunatic asylum at Thorpe, near Norwich, at an estimated cost of £20,000. About 150 additional beds will be provided.

The building of a new cotton manufactory for Messrs. Bury Bros. is to be commenced almost at once at the bottom end of Hyndburn Park, Darwen. The new concern will be of brick. It will be lighted throughout by electricity, and will contain 1,008 looms. The architects are Messrs. Soames and Green, Blackburn and Darwen.

A new club house is being erected at Harrogate, from the designs of Messrs. Milson and Oglesby, architects, Leeds, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

In the case of the application on behalf of George Frederick Bushell, Margate, builder, trading with William Bushell as Bushell and Son, the discharge from bankruptcy has been suspended for three years, ending February 27, 1902.

The new board schools at Bedford were opened last week. They consist of a mixed school, with central hall for 460 boys and girls, and an infant school to accommodate 410 children. The cost of the buildings was £7,050. The schools are warmed and ventilated by Shorland's Manchester grates. The window openings are fitted with Burt and Potts' lights and Leggett's patent fastenings. The contract was carried out by Mr. J. Wharton, builder, Bedford, from designs and under the superintendence of Mr. Henry Young, architect to the board.

Mr. Charles Smith, chairman of the Nottingham Board of Guardians, has laid the foundation-stone of a new workhouse which is being erected on a pleasant site on the outskirts of the city at a cost (exclusive of land and furnishing) of £250,000. The buildings are intended to accommodate 1,650 persons. The work is to be completed in three and a half years.

Major-General H. Darley Crozier, R.E., on behalf of the Local Government Board, held an inquiry at the Guildhall, Walsall, recently, regarding an application by the corporation for approval of the borrowing of money to purchase land as a site for municipal buildings, sanction for borrowing £8,000 for the provision of sanitary depots at Walsall and Bloxwich, and £1,230 for the construction of sanitary conveniences in various parts of the borough.

The new list of members of the Institution of Civil Engineers, just published, shows that on April last there were enrolled 20 honorary members, 2,004 members, 3,953 associate members, 326 associates, and 964 students, making a total of 7,267 names in all classes, an increase of 89 on the aggregate for the previous twelve months, the growth being most marked in the classes of members and associate members.

## Trade News.

## WAGES MOVEMENTS.

**ASHTON-UNDER-LYNE.**—The joiners at Ashton-under-Lyne, Stalybridge, Hyde, and district, have been conceded  $\frac{1}{4}$ d. per hour advance in wages, bringing the total to 9d. per hour, to take effect this week. They asked for  $2\frac{1}{2}$  hours fewer per week, but this demand they withdrew. The number of apprentices is to be one to three journeymen; and the maximum of seven in a shop to be abolished.

**HUDDERSFIELD.**—The joiners have struck work for an advance of three-farthings an hour—from 7 $\frac{1}{4}$ d. to 8 $\frac{1}{4}$ d. Till 1896 the joiners were only getting 7d., but in that year the money was advanced, after a struggle, by  $\frac{1}{4}$ d. The joiners at Sheffield, Rotherham, Doncaster, Bradford, Barnsley, and Harrogate receive 8 $\frac{1}{4}$ d. per hour; Leeds and Middlesbrough, 9d.; and York 8 $\frac{1}{4}$ d. The ship joiners at Hull get 9d. per hour, while the house joiners are at present agitating for an increase from 8 $\frac{1}{4}$ d. to 9d.

**MANCHESTER.**—The threatened dispute in the Manchester and Liverpool joinery trades has been settled by the employers in the Manchester district conceding an advance from 9d. to 9 $\frac{1}{4}$ d. per hour, which came into operation on Monday. When the demand was made the masters offered a farthing now and a farthing in October, and the Liverpool employers gave notice of a reduction of a farthing.

**NEWPORT, MON.**—The whole of the carpenters of Newport, numbering about 150, were on Saturday locked out by their employers. This is the upshot of a number of the carpenters taking sides in the plasterers' dispute. The painters have accepted the offer of the masters of a half-penny per hour advance, insuring a minimum wage of 7 $\frac{1}{4}$ d. per hour. Originally 8d. per hour was demanded.

**THE POTTERIES.**—Judge Jordan, to whom a dispute between the Master Builders' Association of the Potteries and Newcastle-under-Lyme and the local carpenters and builders was referred for arbitration, has made his award. The joiners and carpenters had given notice asking for a rise in wages from 8 $\frac{1}{4}$ d. to 9d. an hour, and for a reduction of the number of working hours. They also asked for the abolition of piecework under rule 7. Judge Jordan certifies that rule 1, which refers to hours, shall be amended so as to afford of a reduction of  $\frac{1}{2}$  hours per week for eight months of the year. Rule 2 has been altered so as to make the wages paid to skilled operatives 8 $\frac{1}{4}$ d. per hour. Rule 7 stands unaltered. The award comes into force on July 1 next. The advance in price does not apply to overtime.

**WIGAN.**—The painters and decorators came out on strike on Monday. The men have been seeking an advance of wages and a definite understanding as to the employment of apprentices. The masters were willing to submit the questions in dispute to an arbitrator appointed by the Board of Trade, but the men desired that a local arbitrator should be appointed. The masters declined to accept the men's proposal, and over 200 painters in the town are now out of work.

**WOLVERHAMPTON.**—The labourers six months ago gave the master builders in this district notice of their intention to claim an advance of  $\frac{1}{4}$ d. per hour in their wages, and the employers retaliated by claiming a reduction of wages. The notices terminated on Saturday, and during the past week negotiations have been proceeding with a view of averting a strike, but without success.

The new town-hall for Conway was formally opened on Monday. It has been erected from the plans of Mr. T. B. Farrington, C.E., borough surveyor, but owing to the illness of Mr. Farrington, the supervision of the work was given to Mr. R. Davies, architect, Bangor, the contractors being Messrs. Thorp and Sons, Llandudno.

## CHIPS.

At Chester, on Friday, Mr. W. O. E. Meade King, an inspector from the Local Government Board, held an inquiry as to an application from the city council for sanction to borrow £11,000 for building public baths, from plans by Messrs. Douglas and Minshall, of Abbey-square, Chester.

The ceremonial laying of the foundation-stone of a Roman Catholic Church at Beccles, to be known as St. Benet's Minster, took place on Wednesday week. The building, designed by Mr. F. E. Banham, architect, will be Norman in style, and is to be built with Ancaster and Bath stone inside and out. The work now in hand embraces the north façade, nave, baptistery, confessionals, and porch, for which about £7,000 is in hand, but more is wanted to complete the church. Mr. F. J. Allen's executors are the contractors.

New athletic grounds at Wath, near Rotherham, will be opened by Lord Hawke to-day (Friday). The pavilion has been erected, and the grounds have been laid out from designs by Mr. W. T. Campbell, of Sheffield.

The Bishop of Manchester consecrated, on Friday, the new mission schools, dedicated to St. Edward, at Castleton, Rochdale. The schools have been erected from plans prepared by Mr. Henry Lord, of Manchester. They are of red brick, with stone dressings, have cost £3,000, and provide about 360 school-places.

To-morrow (Saturday) Plymouth is to be visited by the Devon and Exeter Architectural Society. Mr. James Crocker, F.R.I.B.A., of Exeter, president, will occupy the chair at the luncheon, which will be held at the Duke of Cornwall Hotel. Subsequently the annual meeting will take place, and visits will be paid to the Corporation Dwellings and the Pearn Convalescent Home at Compton.

The Select Committee of the House of Commons which has been considering the Bill of the London and Brighton Company for the enlargement of Victoria Station on the western side, at an estimated cost of almost a million sterling, and the widening of the company's line at various points outside London, have found the preamble proved, so far as it related to the station.

The Woodford School Board have had a scheme for the erection of new schools in the George-lane district under consideration for some time, and plans have been prepared for 750 children, together with accommodation for a cookery centre. At a recent meeting of the Board it was decided to proceed at once with a block to accommodate 488 children and the cookery class-room. The plans for this block have been approved by the Education Department, and tenders will shortly be invited. The architect is Mr. E. Tidman, C.E., F.S.I., Victoria-street, Westminster.

The Burton-on-Trent Co-operative Society, Ltd., are about to erect a range of shops, offices, concert-hall, and show-rooms in Byrkley-street. Mr. R. Stevenson, of Imperial Chambers, Burton-on-Trent, is the architect, and the contract, which amounts to £7,380, has been secured by Messrs. Thos. Lowe and Sons, of the same town. The buildings are to be ready for use by October, 1900.

Dirckmanton Church, Derbyshire, is to be enriched by the erection of a stained-glass memorial window, the subjects being those of the Crucifixion, St. John, and the Virgin. The design selected was that of Messrs. Swaine, Bourne, and Son, Birmingham, in competition with other leading firms. They have also executed eight figure windows for Johannesburg this year.

The Pontefract Corporation have decided to give notice to terminate the engagement of the contractor for the making of the new reservoir on Park Hill, and to authorise the committee to proceed with the work as they thought best. It was stated that the work was practically at a standstill, and that many of the workmen had not for a fortnight received any wages.

The autumn congress of the Sanitary Institute will be held this year in Southampton, by invitation of the mayor and corporation, commencing on August 29. Mr. James Lemon, F.R.I.B.A., M.Inst.C.E., has been appointed president of the section dealing with engineering and architecture.

Mr. J. Passmore Edwards has intimated his intention of giving £10,000 upon trust to equip a school and building for the teaching of Economics and Commercial Science in the new London University.

## "SANITAS" DISTEMPER.

A Washable Sanitary Distemper for Whitening and Disinfecting Walls and Ceilings of Passages, Cellars, Stables, Kennels, Sheds, Farm Buildings, Railway Trucks, Horse Boxes, and for General Use.

7lb. Tins, 1s. 9d.; 14lb. Tins, 3s.; 28lb. Kegs, 5s. 6d.; 56lb. Kegs, 10s. 6d.; and 20s. per cwt.

## TENDERS.

\* Correspondents would in all cases oblige by the addresses of the parties tendering—at any rate, of accepted tender: it adds to the value of the information.

ASHBOURNE.—For making a sewer at Parwick, for the Ashbourne Rural Sanitary Authority:—  
Fielding, J. (accepted) ... £52 10 0

BERMONDSEY.—For rebuilding Haddon Hall mission buildings, Bermondsey New-road, on a fresh site consequent on the Tower Bridge Southern Approach improvement, for the London County Council and the trustees:—  
Roberts, L. H. and R. (accepted) ... £9,461 0 0

# THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LXXVI.—No. 2314.

FRIDAY, MAY 12, 1899.

## DRAINAGE BY-LAWS.

WE casually referred the other day to the new Drainage By-Laws made by the London County Council under section 202 of the Metropolis Management Act 1855, for regulating the dimensions, form, and mode of construction of pipes and drains, and their keeping, cleansing, and repairing, and of other means of communicating with sewers, and the traps and apparatus connected therewith. These far-reaching by-laws, of which we can here only give a brief summary, will apply to any person who intends to erect a new building, or to construct or reconstruct any drain or other conduit communicating with sewers, also to any building "erected before the confirmation of these by-laws as if the same were being constructed in a building newly erected." Clause I. is important, and provides that a person who erects a new building, and drains the subsoil of the site by a drain communicating with any sewer is to provide a "suitable and efficient trap between such subsoil drain and sewer." This will prevent any direct connection between the drain and sewer, and thereby prevent any sewer-air being brought under the building. The trap is to have a ventilating opening at a point near the trap to the open air, and the opening is to have a suitable grating or cover to prevent any obstruction. The grating to have an aggregate of apertures of not less than the sectional area of pipe or drain. The subsoil drain is to be constructed in the manner prescribed for a drain conveying sewage, and the drain above the trap to be of earthenware field-pipes, laid to a suitable fall, and to discharge into such trap. The drainage of surface water into any sewer from an area, forecourt, or paved surface to be by drains furnished with a properly trapped gully at every inlet. Every rain-water pipe to be connected to any sewer to discharge into the open air over a properly trapped gully. Such pipe is not to receive into it any discharge from closets, urinals, sink, or lavatory.

Referring to the materials and jointing for drains, except subsoil drains, Clause 4 provides sound glazed stoneware or semi-vitrified ware or cast-iron pipes; that no such drain is to pass under any building except where any other course is impracticable; that it shall be of adequate size and fall for conveying sewage, and be not less than 4in. internal diameter; that it be laid on a bed of concrete not less than 6in. thick, projecting on each side of drain to an extent at least equal to external diameter of drain. If such drain is of cast iron, the socket joints to be not less than 2½in. in depth, made with molten lead properly caulked, with annular space for lead to be not less than ¼in. in width for 3in. and 4in. pipes, and ¾in. wide for 5in. and 6in. pipes. If such drain is of stoneware, it is to be jointed with socket joints put together with cement. Other subsections require such drains (except those for subsoil) to be water-tight, and to resist a pressure of 2ft. head of water at least; that each drain is to be filled in with concrete, and be imbedded not less than half its diameter.

The thicknesses and weight of cast-iron pipes are given. Stoneware pipes have also thicknesses, depths of socket, &c., prescribed. Thus a 4in. stoneware pipe must have not less thickness than ½in., with a depth of socket of 1½in., and an annular space for cement of ⅛in., and the same thickness is

specified for 5in. and 6in. pipes, with 2in. depth of socket. Drains under a building are to be laid, when practicable, in direct lines the whole distance, and to be imbedded and covered with concrete 6in. thick all round. Iron drains are to be laid on a bed of concrete as in the manner prescribed above for drains that do not pass under a building. Access at the ends of drains under a building is to be afforded. Then follow directions for the composition of concrete, which is to be of clean gravel, hard brick (broken small), and ballast, well mixed with clean sand and Portland cement in the proportion of 1 of cement and 5 of other materials; or clean sand and good blue lias lime in proportion of 1 part sand, 1 part lime, and 4 parts other materials. Drains laid under a wall are to be protected by an arch, flagstone, or iron support, which shall not bear on the drain. Every main drain communicating with a sewer is to have an efficient intercepting trap at a point as distant as practicable from such building, and a separate manhole or other access to such trap. Passing other details we come to the ventilation of drains. Two untrapped openings are to be provided to the drains, and the following alternative arrangements are given:—

(a) One opening above and near the surface of ground is to communicate with the drains by a pipe-shaft or chamber as near as possible to the trap to be provided between main drain and sewer. Such opening is to be situated on that side of trap which is near the building. The second opening to be from a point in the drains as far as possible from the first, by means of a pipe or shaft vertically carried to a height to give a safe outlet for foul air.

(b) When the foregoing arrangement is impracticable the following is prescribed:—One opening by carrying up a pipe or shaft from a point near to the trap, with an open end to give a safe outlet to the foul air; the point at which such opening communicates with the drain being on the side of trap near the building, and the second opening as far distant as possible from the first, to be carried up above and near the surface of ground adjoining such opening, communicating by a suitable pipe with the drains; or (c) if neither of these arrangements is desirable, then both the first and second openings may be obtained by carrying up from the points referred to vertical pipes or shafts to such heights, and in such positions, that, when either acts as an inlet, the other may be a safe outlet for foul air.

Gratings or suitable covers to be provided to the openings; there are to be no bends or angles in the pipes. The sectional area of these pipes to be not less than that of the drain; or, if the drain exceed 4in., the internal diameter of the pipe shall not be greater than 4in.

Other clauses provide that there are to be no inlets to drains within buildings, except such as those of any closet apparatus, slop-sink, &c. That all waste pipes from buildings from lavatories or sinks are to be of metal or stoneware, and to be trapped immediately beneath such lavatories or sink by an efficient siphon trap of lead, iron, or stoneware, with means for inspection and cleansing, and which must be ventilated into the external air where necessary; that bell and D-traps are not allowed; that all waste pipes are to discharge into the open air, over properly-trapped gullies or channel leading to a gully.

The regulations respecting soil-pipes in new buildings, or existing buildings, require that, whenever practicable, such soil-pipe is to be placed outside the building, and it is to be of drawn lead or heavy cast iron. When it is necessary to construct it within the building, it is to be of drawn lead with properly wiped joints, and the thickness and weight of lead or iron are given. A 4in. pipe is to be not less than 7½lb. weight per

10ft. in length; if of iron, not less than 5½lb. per 6ft. length. The joints are to be, if socketed, 2½in. in depth, caulked with molten lead, with ¼in. annular space for the lead for 4in. pipes. If with flanged joints, they are to be securely bolted together with a suitable insertion. No connection with rainwater or waste pipes to be made, and no trap to be allowed in such soil-pipe, or between it and any drain. Not less a diameter than 3½in. interval is allowed, nor is there to be any bend, the soil-pipe being carried up to a sufficient height without diminution as a safe outlet for foul air.

The remaining clauses refer to connection of lead soil-pipe and waste-pipe with iron pipe or drain, connection of stoneware trap of closet with lead soil-pipe, lead soil-pipe with stoneware drain, ventilation of closet traps, &c.—details which we may leave to another article. The effect of the by-laws will be to insure more uniform results in sanitary matters in buildings newly erected, as well as in existing buildings, where any person reconstructs any pipe or drain communicating with the sewers.

A penalty of £2 is to be imposed on every person who shall offend against any of these by-laws, and a further penalty of 20s. for each day after written notice of the offence in case of a continuing offence. The present sanitary regulations are anything but satisfactory: they are fragmentary, and do not apply to the whole Metropolitan area. The vestries administer the drainage regulations, each has its own rules, and no uniformity of observance is possible. It is true there are London County Council regulations as to soil-pipes and other details, but these are seldom enforced. The proposed by-laws are to apply to the whole of London except the City, and as such will be heartily welcomed by the whole building profession and the public, who are most interested in sanitary progress.

## PICTURES AT THE ROYAL ACADEMY.—III.

A MORE leisurely acquaintance with the galleries reveals many pictures of a kind that do not redound to the discrimination of the hanging committee. On the top row of long wall in Gallery III. we see a large group of portraits of a family, very commonplace, and of no artistic merit. On the same line is a garden scene (241) of a rather uninteresting character as it appears to the visitor, and another large canvas, "Overhauling the Nets" (255), though "skied," occupies a larger space than its merits deserve. We expected at least to find in this gallery, especially on the north wall, an array of strong pictures; but the visitor who goes to see what there is in the place of Leighton finds a large portrait group by James Sant, "The Daughters of J. H. Buxton, Esq." (190), which, whatever its merits as a group of portraits, is decidedly poor and uninteresting as a work of artistic portraiture. There is a want of repose—the young ladies appear to have no one interest; they look in different directions. The grouping is faulty, and the colour weak. Another big picture occupying valuable space is F. Goodall's "On the Road to Mandalay"—a subject suggested to the painter by Mr. Rudyard Kipling's "Barrack-Room Ballads." It depicts a British soldier in uniform coquetting with a Burmese girl, in white jacket over a pink silk dress with sash, who offers a white blossom to her soldier lover. As a painter of Egyptian subjects and costumes Mr. Goodall has been accurate in his costumes of the young soldier and Burmese maid; the landscape is Tropical, the sky intense in its blueness, the foliage luxuriant; but with all these features there is little that draws the attention, or which exhibits a sufficient motive for the work or the size of canvas. These large pictures necessarily displace

others of more artistic interest or of better qualities in composition and colour.

"The Marsh Farm," by Arnesby Brown (191), is a pleasing sunrise effect with mists which throw a thin white veil over the landscape and the cows. The portrait of Miss Lilian Croft (215), by Ralph Peacock, is a graceful figure of a bright-haired young lady in an evening Empire dress of spotted silk. This young painter has not merely given us a portrait, but has tried to give us the manner the emotional and individual character of the young lady; and this picture may be placed with Mr. Sargent's work, or that of Mr. Orchardson. Alfred East, in his "Monk's Pool, Beardsale Priory," is charming in its spring-like colour and its brilliant effective handling and freshness. W. Logsdail, whose Venetian canal scenes are so well known, has gone a little out of his way in giving us a palatial interior, "A Venetian Interior in the 18th Century." It is to the architecture we take an exception. The perspective and drawing appear faultless; but the ceiling decoration looks heavy and clumsy in detail, and the colour in murky tints rather increases this effect. The lady singing to the accompaniment of a mandolin and the negro page are the chief occupants. A large chandelier hangs from the ceiling of rather clumsy design, and we must chiefly look upon the interior as an architectural setting in rather rococo taste.

A lesser work of *genre* is "A Cause and Just Impediment," by H. Gillard Glindoni (248), a brilliant and carefully-painted incident where a bride and bridegroom and party are about to enter a country church, but are challenged by a lady standing near the porch. "Skating Days in Old Brabant," by George H. Boughton, is a large picture in which the painter's *penchant* for snowy scenes is seen at its best. The frozen meadows and the quaint picturesque surrounding of a Flemish city are painted with much brilliance and sparkling effect in pale tints of grey and green. In the foreground, a young gallant is putting on his lady's skates, and there is a sense of gaiety in the scene. "The Widow of Nain," by Louis Feldmann, is a picture by a Flemish artist of much talent. The Saviour's figure is hardly pronounced, and the Flemish garb of the mourning crowd looks rather strange for the subject, while the distinct Flemish nationality of the mourners seems to detract from the merits of the painter's theme. Edward W. Waite's "Hawthorn Blossoms" (267), is a charming work. Among lesser works worth noticing in Gallery IV., we must refer to Margaret I. Dicksee's "Sheridan at the Linleys," an interior where young ladies are singing to the accompaniment played on a grand piano. Young Sheridan is attentively listening to the singers, and is said to have conceived a strong attachment to the elder girl, which resulted in a romantic marriage. The young man, scrupulously dressed in a green-silk coat, is leaning on the piano; the accessories and costumes are correct, and well painted.

Charles M. Paddy's "Marooned" (260) is one of the cleverest pictures. It represents three unfortunate men cast adrift on a desert island in the Tropics, to shift for themselves. The crew on the boat are pulling away as fast as they can, and one of the deserted men is retaliating by firing at the departing crew. Both the men in the boat and those marooned are drawn with much vigour, and the tale is well told.

"In Wintry Spring," in the next gallery, Mr. G. H. Boughton again paints a snowy landscape, but more of a fantasy than a reality. The grey, cold blast of winter is seen on one side of a stream, and the pink blossoms of spring on the other. A young maiden, as fragile and delicate as the blossom itself, stands shivering on the bank against the wintry blast that sweeps on her. Delicate handling and subtle tints of grey and pink,

PASSMORE EDWARDS HOSPITAL, WILLESSEN.

make a successful work of much poetical force.

We pass Mr. Leader's fine work "Where Brook and River Meet," already noticed, to a few others. "Elégie" (356), by Wm. A. Bouguereau, is quite French in sentiment. A well-modelled nude maiden leans over a monumental pedestal at the foot of which is a cupid. David Murray's picture "The Church Pool" (361) is strong and pleasing in its sense of colour. The very graceful and delicate picture by Ross E. Clark prompted by the poem "Among a Bed of Lilies I" (363), with the figure of a maiden in white, and Walter Langley's "Wandering Musicians" (367), with village green and bright evening sky, touching in its reality as well as poetic meaning, are worth attention; so also is Robert W. Allan's fine sea coast "Fresh From the Sea," full of freshness and strong colour. One of Dandy Sadler's country incidents of every-day life is No. 379, "The Christening." A young husband and bashful wife, accompanied by nurse and child, are being felicitated by friends outside the church; the vicar, in his surplice, is saying a kindly word to the wife, while another gentleman is bending over an old headstone trying to decipher the inscription. There is a sense of humour in the situation, which is painted with all Mr. Sadler's usual care and detail; albeit the church architecture is of a poor Carpenter's Gothic type, and is only redeemed by the white roses which climb in wild luxuriance over the high gabled porch. "An Acquittal," by Frank W. W. Topham, shows a crowd surrounding the entrance of a Venetian Tribunale; where a young soldier, released, is being kissed by his sweetheart, while the crowd are making an ovation in his favour. The sunlight effect on the crowd and the archway is cleverly painted. Henry S. Tuke also has a luminous sea-piece, "The Diver" (385), boys in a boat denuded of their dress, one about to make a plunge, is well drawn in the modelling of the figures, and the strong sunlight on water and haze are well

handled. A similar luminous and brilliant piece of sea-painting is W. H. Margetson's "The Wonders of the Shore" (396), a graceful maiden clad in clinging diaphanous drapery, fresh from the bath, is walking along the sandy beach. She holds her dressing-gown, which is blown by the breeze, while she looks at a crab on the sand. The rippling sea washing the beach and the reflected light on the water left by the receding tide on the sand are delicately handled. There is a clear open-air effect, and the work has a decorative charm apart from its drawing. H. H. La Thangue's "Love in the Harvest Field" (390) is another of this painter's studies of open-air peasant life. Of similar composition, Mr. La Thangue shows a man and his sweetheart walking home at sunset through a field. There is the same sense of light and shadow and vigorous realism, just as we may imagine from a painter who lives amongst the rural life he studies. F. Spenslove-Spenslove's "Gold, Green, and Grey" is a delicate handling of colour—a study of Picardy poplars in autumn.

#### THE PASSMORE EDWARDS HOSPITAL, WILLESSEN GREEN.

IN this scheme, as the plan will explain, the hospital has been doubled in size, the former kitchen block being pulled down, and a new and larger kitchen block erected further back upon the site. The two front wards for males and females have been doubled in size, giving an increase of eight beds, and new duty-rooms and bathrooms have been added for each sex. The operating and committee rooms have been enlarged, and a dispensary, store, children's ward for five beds, private ward for one bed, duty-room, bathroom, and w.c. for children's ward, bathroom and w.c. for private ward, and a nurses' duty-room have all been provided on the ground floor. A heating-chamber is also provided under new kitchen block. On the first floor, three new bedrooms, bathroom, linen-room, and w.c., and new staircase leading to same have been provided, and a swing verandah is contemplated outside the

PASSMORE EDWARDS HOSPITAL, WILLESDEN.—NEWMAN AND NEWMAN, Architects.

children's ward. As will be seen from the ground plan, arrangements are made by which a still further extension can be carried out at any future time. The hospital has been fitted up throughout in the most modern style, great care being taken with all sanitary matters. The buildings have been carried out in a most satisfactory manner by Messrs. Cowley and Drake, of Willesden-green, the work being of a most intricate and complicated nature, the total cost of the work being nearly £4,000, a large portion of which has been provided by Mr. Passmore Edwards. The architects are Messrs. Newman and Newman, F.R.I.B.A., F.S.I., of Tooley-street, London Bridge, S.E.

#### CONFERENCE ON ROAD-MAKING MATERIALS AND APPLIANCES.

THE conference of county, municipal, and urban surveyors and engineers on road-making materials and appliances in connection with the *Surveyor* exhibits at the Building Trades Exhibition in the Agricultural Hall, reported in our last issue, pp. 600-2, was concluded on the afternoons of Friday and Saturday in last week, the attendances being good, and the interest well sustained throughout.

On the Friday the chair was taken by Mr. A. T. Davis, county surveyor of Salop, in the absence through illness of Mr. O. Claude Robson, President of the Association of Municipal and County Engineers.

#### ACCESS COVERS AND PAVING MATERIALS.

Mr. J. PATTEN BARBER, surveyor to the Islington Vestry, read an exhaustive paper on the exhibits in Divisions I and J of the *Surveyor* exhibitors. Dealing first with the covers for access to sewers, pipes, and conduits, several kinds of manhole covers, both closed and with openings for ventilation, were described. In one the wood blocks round the ventilating portion of the cover were inserted from below, and were supported at the base by a detachable plate—an arrangement which admitted of the removal of worn blocks and the insertion of new ones with very little difficulty. In the octagonal cover used at Wimbledon, the wood blocks were made tapering, and were inserted from the top; they rested on projecting flanges at the base, and as these flanges only partially closed the bottom part of the recesses for the blocks, the latter could easily be drawn out from below when it became necessary to insert new blocks. In the construction of ventilating covers the necessity for making the closed portion overlap the sides of the mud receptacle sufficiently to prevent mud falling through the open part of the cover and lodging on the sides of the receptacle, or falling into the shaft, was sometimes overlooked. In the exhibits of materials for town carriage-ways a large number of quarries were represented. The only qualification sought 30 years ago in a paving stone for heavy traffic was hardness, and the sole consideration was durability. Only on such grounds could they conceive of the adoption of the old Penmaenmawr setts for carriage-ways; the dark glassy surfaces of these setts being the most slippery material on which horses had ever been driven. The life of the stone would probably be everlasting, and thus it might be regarded as the cheapest material but for this slipperiness. There were many stones now available which, whilst durable gave a good foothold to horses, and were reasonably economical in maintenance. For heavy traffic Guernsey granite, a bluish hard close-grained stone, was largely used in the Metropolis. It was good where the heaviest traffic occurred; but it wore slippery, but not so much as to become dangerous except on steep inclines. The stone could be redressed with very little waste, its texture being close and uniform. Ronez granite from Jersey had been recently brought into London. It resembled Guernsey granite, was an excellent stone for wheelers, and could be obtained in good lengths. There was another Penmaenmawr stone now used, which was similar in quality to Guernsey. The Cleve Hill and Rowley Regis setts, being black, might not be regarded with favour where appearance had to be considered; but the stone was close, fine-grained and tough, wore well, and was not slippery. Pwllheli granite was a compact stone, tough and gritty, and might be classed half-way between Guernsey and Aberdeen granite. Arklow granite, from County Wicklow, was dark and compact, and apparently would wear gritty. Of the Leicestershire stones, there were Mansfield,

Bardon Hill, and Mountsorrel, all moderately coarse in texture, and might be placed for wearing qualities a little below Guernsey granite. Enderby was a finer-grained, more compact stone than the three just referred to, tough and sufficiently gritty. He had found this very wasteful to re-dress, many setts being shattered in the operation. The Royale granite setts had been recently introduced into this country, although they had been used in Paris for twenty years, and were said to withstand heavy traffic. The Aberdeen granite setts, though more worn by heavy traffic than Guernsey and many other stones, were, nevertheless, eminently suitable for heavy traffic. Norwegian, Newry, and Castlewellan granites were all useful for lighter traffic, and were superior to all except Aberdeen granite for non-slipperiness. He referred in detail to the materials for macadam, including those from Haslingden, Rochdale, Moher and Hopton Wood. Passing on to consider hard-wood paving, Mr. Barber alluded to the well-known Jarrah from Western Australia, and also to the greenwood and white oak from South Carolina, and Mora wood from Demerara. The three last materials were new to this country; they were lighter than Jarrah, tough and fibrous, and probably less noisy. He had put down Mora wood, but had not yet had sufficient experience with it, and was also about to experiment with the others in the hope that they would be less noisy and less liable to expansion and contraction than some of the harder woods. Sanitary block-paving was principally composed of granite chippings and bitumen, and wore without becoming slippery. The author was making some experiments with various bricks for carriage-way paving both under heavy and light traffic.

#### IRISH MATERIALS.

Some notes on "Roadmaking Materials from the North of Ireland," prepared by Mr. S. G. FRASER, of Belfast, were read, in the absence of the author, by Mr. THOMPSON, of the *Surveyor*. Attention was drawn to the white, red, and grey sandstone, obtained from Scrabo, red sandstone from Dundonald and Dungannon, the latter being much used all over Ireland. The blue whinstone abounded in County Down, but varied much in quality, the deeper beds being the best and most uniform. Ballygowan setts were extensively used in Belfast and the North of England. Basalt or "blockstone," although found in abundance in Co. Antrim, was not, as a rule, a good stone for setts, as it split under the hammer, but was excellent for rubble masonry. Both whinstone and blockstone made good macadam, and whinstone setts never grew slippery, and wore well under moderate traffic. Newry granite was quarried to a radius of twenty to thirty miles. Artificial flags had been extensively used for many years, and had assisted to keep down the prices of natural stones; the price varied from 3s. 4d. to 3s. 9d. per yard; the chief objection to artificial flags was the expense of repair after a trench had been made in a footway for mains.

#### KERBING AND CONCRETE FOR FOOTPATHS.

Mr. H. T. WAKELAM, County Surveyor of Middlesex, read a paper in which he said he should simply describe the materials, and would not criticise their qualities, merits, and demerits. He emphasised the value of kerbs and footpath edgings as a protection to the pedestrian. The best form of cast-iron kerb that had come under his authority's notice was made by Messrs. Bayliss, Jones, and Bayliss, of Wolverhampton. Each piece was about 3ft. long, and had two back lugs, the whole of the kerbing laid being secured throughout its entire length with oak wedges driven into the lugs. For renewals the wedges were sawn through and withdrawn. Channels proved a protection for kerbs; they prevented percolation and saturation of the underbed, and the depressions and upheavals on the kerb line often seen on unchannelled roads were obviated by their use. Channels should be constructed on good foundations, and be sufficiently wide to generally carry off storm water, and should be bedded so that heavy weights would not disturb the true gradients. The author had found concrete *in situ*, a most suitable channel for suburban districts and country towns; it was easily constructed, cheap, and easily cleansed. Speaking upon footways, the author laid emphasis on the importance of laying a good foundation. If a natural one could not be obtained, an artificial one should be laid down, such as furnace clinker, hard core, old

broken bricks. In the choice of a natural material, the engineer and surveyor should select stone without laminations, and should watch that it was properly dressed at the joints throughout its entire thickness. In choosing Yorkshire stone, it would be found that the hand-dressed was the cheapest in the end, and only one kind of stone should be obtained, or unevenness of wear would be evident. Natural asphalt—by which he excluded tar-paving from use—had excellent lasting qualities, and, from a sanitary point of view, was hard to beat. Having referred to the slab paving made from destructor clinker by the engineers of Hornsey, Liverpool, and Birmingham, the author gave some of the compositions of concrete *in situ* used for footways, and remarked that it was a good plan to place a strip of roofing felt between each bed or bay to allow for expansion, and narrow bays always answered better than wide ones.

A short discussion followed, in which Mr. E. G. MAWBEY, borough surveyor of Leicester, defended the Leicestershire granites as paving-sett materials from some of the aspersions cast upon them, and explained that in Leicester he was using for footpaths concrete or artificial stone slabs 2½ in. in thickness, which could be obtained from the Victoria Stone Co. and other firms at about 4s. per square yard delivered. *In situ* concrete flags could be made for about 2s. 6d. per square yard; but he considered the ready-made slabs worth the additional cost. He coupled in the vote of thanks to the readers of papers and chairman that of Mr. Gibson Thompson, the editor of the *Surveyor*, who had organised the special exhibition and the very practical conferences. Mr. J. T. Eayrs, M.Inst.C.E., of Birmingham; Mr. C. H. Cooper, M.Inst.C.E., surveyor to the Wimbledon Urban District Council; Mr. S. S. Platt, borough engineer of Rochdale; and Mr. A. D. Greatorex, borough engineer, West Bromwich, also joined in the discussion; and Mr. Patten Barber replied, pointing out that the Penmaenmawr stone now quarried for setts was from a different bed from the slippery wearing setts formerly supplied, and which he had adversely criticised. Mr. Wakelam, Mr. Thompson, and the chairman also replied.

On Saturday, the closing day of the conference, the chair was taken by Mr. John Price, city engineer and surveyor of Birmingham, when four papers were read, three on such diverse subjects as urban tree-planting, tramway rails, and name-plates being submitted by Mr. Francis Smythe, surveyor to the Finchley Urban District Council, and the fourth by Mr. J. W. Bradley, borough engineer of Wolverhampton.

#### TREE-PLANTING IN STREETS.

In his first paper Mr. Smythe observed that the young trees to be planted in towns should have a good tuft of roots, produced by having been transplanted two or more times during the growth; the stem should be fairly straight and free from excrescences (for street planting the stem should not be less than 7ft. in length), with a fairly good head; but as the young stuff is usually grown close to one another, it is difficult to obtain a very large amount of leaf-growth; if there are plenty of roots a good head will soon be produced. A considerable amount of injury is often done to young plants, especially in dry, windy weather, by the length of time that elapses between the time they are dug up and planted, causing the roots to be dried up and the sap-ducts to be permanently contracted or destroyed. If the trees cannot be planted as soon as received, the roots should be covered up by damp straw, manure, or earth. One of the reasons trees are not often successful in their growth when planted in streets, is that no care is taken to prepare the site for their reception. How can a tree be expected to thrive in a hole about 2ft. square, either in a stratum of compressed builders' rubbish, or, again, in an impermeable clay, forming a sump for all the rainfall that may follow, and the holes filled up perhaps with a couple of barrow-fuls of road-drift? If they survive it will always be difficult—like Irish cattle—to tell their age. There are few streets in which any portion of the original soil is left, in which case an excavation at least 24ft. superficial should be made, say, 4ft. wide by 6ft. long, and from 2ft. to 3ft. deep; if in an impervious soil, it would be preferable to have the shallower depth, unless a layer of rough material can be laid at the bottom, with a drain to take away the superfluous moisture, which would be far better than having a continual sump. Indeed, if it were possible, it would be best to have the tree planted on a mound under

such conditions. The excavation should then be filled up to the level of the surface with good soil. The author collects all the road trimmings he can, and after it has been left in a heap for six or twelve months to rot, uses it for this purpose. To this should be added a small proportion of rotten dung; after this has been well trodden down a hole is made large enough to receive the roots, after they have been well and carefully spread out. More soil is put into the hole after the tree is planted, and if possible a layer of dung may be spread over the last layer of soil, and finally, a sufficient quantity of soil or gravel can be spread to bring the surface of the hole to the required level. Planting should not be done if possible in wet weather, and on no account unless the fresh soil is in a friable condition. Finally, the tree site, unless it is frosty weather, may receive a good watering to settle the soil round the roots of the tree. A great mistake is often made in planting too deep; a covering of 6in. of soil is ample above the topmost roots. As soon as the tree is planted it should be fastened to a stake or other support driven firmly in the ground, and it should be protected from injury by an iron guard, or wire netting. Trouble is experienced by wood stakes rotting off close to the ground, and the author exhibited an iron stake he had devised, made of 1½in. galvanised iron tubing, with a solid point and a turned wood final. As soon as the tree is planted the four-tined stay is driven into the ground, and the tubing is then driven through the socket of the stay, which it loosely fits. It is very durable, inexpensive, and will last for years. The reasons for pruning are: First, the removal of any branches that may not be required; and, secondly, to increase the ultimate leaf area. The tree should have been planted at least twelve months, to enable root-growth to be fully commenced before any pruning is done, and then, if the lower branches are small, say less than ½in. or even ¾in., they may be cut off close to the trunk that season, and perhaps, if the head of the tree is a good one, one or two of the branches next above them shortened half-way. Another season these latter may be cut back to the trunk, and a few higher up shortened half their length. Pruning should only be done to a limited extent. The best time is in the early spring, before the sap commences to rise. The author suggests the following selections of trees as being the most useful for street planting in the order named:—Trees for towns: Maple-leaved plane (*Platanus acerifolia*), Norway maple (*Acer platanoides*), sycamore (*Acer pseudo-platanus*), Canadian elm (*Ulmus Canadensis*), Canadian poplar (*Populus Canadensis*), balsam poplar (*Populus balsamifera*), Italian poplar (*Populus nigra*), abele poplar (*Populus alba*), common birch (*Betula alba*). Of the above trees the plane and balsam poplar prefer a heavy soil. The plane does not do so well in a very bleak position, and the balsam poplar, one of the best of its kind, has rather a tendency to canker on light soils. All the other trees will do well on any soils and in any aspects. Trees for seaside places: Norway maple, sycamore, grey poplar (*Populus canescens*), Huntingdon willow (*Salix alba*), seaside willow (*Salix rubra*), common birch, wych elm (*Ulmus montana*); the latter requires a heavy soil. On chalk soils all the maples, poplars, willows, and limes (tillias) may be planted; and for suburban districts the lime does well, but it is liable in hot weather to sugar-blight, to which all dirt and soot adheres, and it does not therefore suit towns. For smoky or manufacturing towns no tree does better than the sycamore, Canadian or balsam poplar; the balsam may have the preference to the Canadian poplar on heavy soils. Oaks were not named on account of their slow growth; nor flowering trees, on account of the damage done to them by children getting after their flowers, fruit, or nuts. The smaller kinds of trees should not be planted closer than 30ft. apart, and with the exception of limes on heavy soils, where they do not grow luxuriantly, and the birch, all the trees mentioned should have 40ft. between them.

#### TRAMWAY RAILS.

In a paper on this subject, Mr. SMYTHE said he only proposed to consider that afternoon two kinds of mechanical traction—viz., cable traction and electricity. There are only six examples of cable traction in this country, and one only in course of construction—viz., extensions at Edinburgh. In America it is gradually being superseded by trolley traction. The system is costly in execution, but economical in working, especially on hilly roads where the cars follow one

another in quick succession. As far as interference with road surfaces are concerned, the central slot rail is an objection. Electrical traction may be divided into four systems—viz., surface-contact, accumulator, conduit or underground, and trolley or overhead. In the surface-contact system devices are fixed against or attached to the rails, by which the current is conveyed to the motors, but the difficulties attending the system and its liability to get out of order has prevented its adoption. The accumulator system would perhaps be an ideal one if it were not for the great waste of power, the great weight of the batteries to be carried under the car, and cost of maintenance and repair; these items cause the cost of working per car mile to be so much that it is prohibitive to its adoption. By the conduit system the current is conveyed by a feeder laid in an underground channel, similar to the cable system, and it is conveyed to the motors of the car by means of a collector hanging from the car and passing through the slot. There is the same objection to the central rail conduit as regards interference with road surfaces as in the case of cable traction. The construction of conduit, and strength and number of yokes or cast-iron supports, must be sufficient to prevent the slot being closed. The only objection to the conduit system is its initial cost; and in comparison with the trolley system, the extra cost of maintenance and repair. The author has lately estimated the cost of constructing a tramway in his district, and in round figures it amounts to \$11,500 per mile single track for conduit, as against \$7,700 for the trolley system—a difference of \$3,800, while the extra cost of up-keep is estimated at \$600 per mile. Calculated for a double track, the difference is still greater. The great thing in favour of the trolley system is its cheap initial cost, and in the maintenance and repairs required; but the objection is the standards and overhead wires, probably more on account of the wires than the standards, as where similar poles are used for arc lighting alone there does not appear to be any objection to them. It is, however, astonishing how soon persons become used to their existence. The conducting wire is either supported by steel standards fixed along the edge of the footways or in the middle of the roadway about 40 yards apart, and less on curves, or on span wires across the street, fixed either to standards or roses attached to buildings. Undoubtedly the less wire there is the better, and for this reason the span wire system does not meet with favour in this country. A separate feeder is laid underground and connected to the conductors at intervals of about half a mile, in order that the current may have a more even distribution. The current is conveyed to the motors of the car while the latter is in motion by the trolley arm fixed on the roof of the car, which has a universal joint. To complete the circuit the current is returned to the power house by the rails being used as conductors, and great care has to be exercised to have a continuity between one rail and another. Modern practice is to use a rail in one piece to form a girder. The weak part of all tramway tracks is the constant movement that takes place at the ends of each length of rail where they meet one another, and in order to avoid this as much as possible the fish or connecting plates are made longer, and a sole plate added. One of the greatest difficulties in tramway maintenance is the greater wearing away of the material of which the track is constructed close to the rails, and devices have been introduced to avoid this. One of these was the insertion of narrow strips of steel alternately, of varying lengths, let into the pitching or paving at right angles to the road, but, from some cause, none of these have yet found favour.

#### STREET AND OTHER NAME-PLATES.

In his third paper Mr. SMYTHE mentioned that it was not until the third or fourth decade of the present century that cast iron was used for naming streets, and at the present time probably more name-plates made of this metal are used than any other kind, although many devices have been introduced, some of them running cast iron very close for public favour. Among these may be mentioned enamelled-iron name-plates made of an alloy containing a large proportion of zinc, embossed or raised letters on sheet iron and zinc plate, or letters cut out of the same metals, china or glass letters fastened on to wood or metal, plates made entirely of glass, glazed terracotta or china, metal plates let into the surface of foot-

paths, glass slips fastened into the lanterns of public lamps, and metal plates either fastened to the ladder arms of the same, or fastened to the lamp columns. Cast-iron name-plates have hitherto been most in use on account of their cheapness and durability, the only objection to them being their brittleness, but this defect can be much modified by the mixing of the metal and annealing. If some means were adopted by the manufacturers to stove the colours upon them it would add to their usefulness, and it would also be well if the surface were covered with a permanent enamel. Enamelled iron name-plates run cast-iron ones very closely in public use, on account of their smooth surface. The only objection to them is that the enamel often scales from the iron backing on account of oxide forming on the surface of the iron, either naturally or from a blow, and when once this commences the plate soon becomes disfigured and the lettering partially obliterated; some manufacturers say their plates are proof against the defect; but the author's experience is that, although there are some plates much better than others, they are all liable to the same fault. As, however, the scaling always commences at the edge, a great protection to the plate is to let it into a metal or wood frame. A metal plate is shown in this exhibition which avoids one of the defects of iron—viz., in being rustless, and it is stated by the manufacturers that the colouring is stoved thereon. The author has had a serviceable and cheap name-plate made in the following manner:—A 1in. piece of well-seasoned red deal was cut to the required size and the corners rounded to prevent the zinc from peeling off the hoop-iron, which it would do if the latter were bent to a sharp angle; into the board a number of tinned tacks were driven to within ¼in. of their heads, a piece of galvanised hoop-iron 1½in. wide was fastened with zinc nails round the edge of the board, projecting ¼in. in front of it, and flush with the back, a thin grout of Paris plaster was run over the tacks to the depth of ¼in., the heads of the tacks forming a "bite" for the plaster, and while the latter was in a moist state a glass slip name-plate was bedded upon the plaster. Although not necessary, a finish was given to the name-plate by a filleting being formed round the edge, made of white and red-lead putty, the back was painted to preserve the wood, and two wrought iron lugs screwed on to the back to hang the plate. The glass slip must not be warped, and if over 2ft. in length, it must be made of 21oz. glass. Latterly the author has a wood cleat, ½in. or ¾in. thick, placed between the name-plate and the wall or the object to which it is attached; the collection of dirt or soot above the plate is by this means washed behind the plate instead of over it during rainy weather. As a rule, street name-plates are made too small and not sufficiently prominent; an extra-sized letter does not add a very large proportion to the cost, as the time of fixing, which is a considerable item of the expense, would not take any longer. A bold moulding round the plate increases its prominence.

#### ROAD-MAKING APPLIANCES AND LITERATURE.

Mr. J. W. BRADLEY, borough engineer of Wolverhampton, read an interesting paper on the "Road-Making Exhibits." He confessed at the outset that he had been disappointed in the number and variety of the exhibits in these sections, for he thought the occasion would have been eagerly seized by manufacturers, as it would have afforded municipal engineers a unique opportunity for gaining new ideas and interchange of practices followed. In the first section—direction-posts and milestones—there were certain things to be kept in view to enable the structures to fulfil their purpose. Direction indicators should be of an imperishable material, bold and neat in design, with strong self-fixing bases. The lettering should be bold and legible, and the direction arms easily fixed at an angle without the necessity for special castings or complicated fastenings. As to milestones, he preferred those with flat faces to the old V-fronted ones, the latter being in his opinion inartistic. Referring to the neat and artistic designs and exceptionally fine castings for lamp columns exhibited by the Coalbrookdale Iron Co., the author expressed his surprise that so many lamp-pillars were erected by corporations and gas companies of a design which he had described as "horrific" when the cost of one artistically designed was so very little more. Mr. Bradley next referred to incandescent gas-lights, remarking as to these

that where a town had not a large electric-light installation, or did not propose to extend its electric street lamps beyond the district shopping area, the suggestion of incandescent gas-lighting was well worthy of the trial; but most depended upon the relative prices of gas and electricity, the ratios of which varied enormously. One of the great difficulties to be feared, when first incandescent burners began to be used for street-lighting, was the short life of the mantles, owing to vibration caused by passing traffic. Many so-called improvements had been devised and patented, and one of these, which had been tried with success for the past three years in Bradford (where some 2,000 were in use), was that invented by the Anti-Vibrating Incandescent Lighting Co., of Bradford, for giving longer life to the mantles. The burner was suspended by a spring, and had a flexible gas tube connected to the bottom, thus preserving the mantle from all shocks. The author dealt at some length and with much ability with the literature of road and street construction, first calling attention to the admirable series of a-little-too-detailed reports, issued by the engineers of roads and bridges in France, and the professional journals of that country, which contained matters of much interest to the municipal engineer. The civic authorities of the United States set our corporations and urban and rural authorities an example in the detailed statistics they compiled and issued, and many of them were of the highest value. The only body in this country which had a statistical department was the London County Council. The author next referred to the works on road engineering issued by Messrs. Chapman and Hall and by Messrs. E. and F. N. Spon, and made some interesting excerpts from the bibliography of road construction in this country, from the days of the Romans onwards. In conclusion, he remarked that Bacon's aphorism held as good now as in the days of Elizabeth. "There be three things which make a nation great and prosperous—a fertile soil, busy workshops, and easy conveyance from one place to another."

A discussion on the four papers took place, in which Messrs. J. Patten Barber (Islington), S. S. Platt (Rochdale), W. Stubbs (Blackburn), Yates (Waterloo, Liverpool), Howard Smith, H. T. Wakelam (Middlesex), and the Chairman took part. In summing up, the Chairman said that in Birmingham tree-planting was carried out under exceptional difficulties, but they made great efforts to maintain them. The trees which did best in that city were London planes, Ontario poplar, Huntingdon elm, common sycamore, and Canadian poplar. He exhibited sectional models in cardboard of tram-rails in section, including the one used in Brussels and carried out by a Berlin traction firm, and that adopted in Birmingham and devised by himself, which was, he believed, the shallowest conduit that could be made, and a modification of that scheme was being adopted in certain towns in the United States. The cost of a conduit system was very much greater than an overhead system; the shallow Birmingham one was £2,200 per mile more than any overhead system. In Birmingham they had decided to extend the incandescent-gas lighting by 2,000 street lights; they would not use any patented system, but a plan of their own to obviate vibration. In the formation of a macadamised road, he feared there had been no particular advance since the days of Telford, and where so-called "light railways," or, rather, country tramways, were laid down, no surveyor would venture to put down macadam between or outside the tram rails. He considered that the Light Railways Act had been prostituted by its provisions being utilised in connection with the construction of tramways, instead of being restricted to light railways, mainly for the conveyance of agricultural produce into towns, as the promoters of the measure contemplated.

#### CRICHTON CHURCH.

THE collegiate church of Crichton is one of many founded in the 15th century. Now, about 300 years after the eviction of its clergy and forfeiture of its estate, the work of restoration has been accomplished. A complete scheme was not contemplated in the plans and estimates; accordingly no provision could be made for restoration of the pinnacles, or for removal of the unsightly north staircase building or opening up the old window at its back; nor was it thought

possible to restore the east window (20ft. by 12ft.) otherwise than with the simple splays of the transept windows. But as a clearance was made and the work of reconstruction had begun, additional interest was awakened; a great amount of work not contemplated at first has been done, and the church has been completely restored in all the characteristic details of construction, with exception of its pinnacles, the east window, and its sacristy. The sacristy, with its lofty vaulted roof, could not be replaced; but a vestry has been erected on its site, the unsightly gallery staircase taken away, and the north window restored to match the rest. The restoration of the interior involved much heavy work, not merely in clearing out the modern church and galleries, but also in repairing the many rough holes made for beams and other timber-work, replacing portions cut out of pillars and arches, and also the cleaning of the stone from floor to apex of the lofty vaulted roof. The surface is unbroken by any decorative feature, in stringcourses or ribs. There is a small trefoil opening at the tower, a piscina in the south transept, sedilia in the south wall, and a small aumbry with moulded sill on the north wall. As to the improvement of the interior in its accommodation for the parish church, the whole area of the building is required for seating the congregation, the galleries being done away. The floor is laid at the old choir-floor level, and on the higher space formerly the sanctuary; the seating has been raised with a passage in front, nearly in line with the north and south doors. The steps at tower and chancel arch could not be retained. The pulpit is placed to command an unobstructed view of the congregation—i.e., at the west end, on a small platform. This is in front of an inner porch at the principal or west doorway, and over the porch the organ-case and organ are erected. The passages run round the side walls with hot-water pipes in trenches. All the woodwork above the floor is in fumigated oak. The framed panelled work in porch, pulpit, &c., is designed with the usual Decorated Gothic details; bench-ends are moulded and have *fleur-de-lis* finials, but there is no wood lining on the walls. Friends have come liberally forward to supplement the work of the committee. One donor has ordered a fine wall screen for the east wall and a Communion table from Messrs. Jones and Willis; another has filled the east window with an elaborated design in stained glass, as a memorial of one long connected with the district; and a side window contains a similar memorial of a minister of Crichton. In addition to the work above described, the heritors have renewed the tower roof, repairing its parapet, opening up its windows, and provided a complete system of spouting and drainage. The whole of the work has been carried out by tradesmen of the parish, from plans by Messrs. Hardy and Wight, architects, Edinburgh.

#### FIRE-RESISTING CONSTRUCTION OF THE NEW ADMIRALTY OFFICES.

THE new Admiralty buildings, now approaching completion from the designs of Messrs. Leeming and Leeming, will complete the block and make an imposing addition to the architectural surroundings of St. James's Park. From the Mall a good view is obtained of the new structure, with its corner turrets and cupolas. One of the chief features of the building, which as an example of workmanship and solid construction is unsurpassed, is the large introduction of the fire-resisting floors, ceilings, and roofs of Messrs. Mark Fawcett and Co. The whole of the floors, the partitions, the flat and sloping roofs, and the steel dome frames are constructed on this excellent system. Our inspection of the building the other day enables us to give our readers some idea of the construction employed by this well-known firm, who have applied the Fawcett system to the whole building, by which all the constructional steelwork is shielded or inclosed by tubular lintels and concrete.

The Fawcett system is well known to most of our readers; those who wish for more particulars, and the number of buildings in which the system has been used, will do well to consult the author's newly-published book on "Fire-Resisting Floors, Ceilings, and Roofs Constructed in Her Majesty's Buildings." We shall now describe the system as we see it in the New Admiralty block. At the time of our visit all the floors showed the naked construction, the girders being filled in with the tubular lintels ready for plastering below, and the breeze con-

crete filled in above the lintels with the wooden joists or fillets upon which the flooring is fixed. These lintels, which constitute the main feature of the system, are of a semi-fireclay, or red chimney-pot earth, made in the form of semi-circular tubes, with ribs and corrugations below, and each is supported on the lower flanges of the joists. Above, these lintels form a succession of ridges and furrows, while their lower flat flange-like plates have dovetail grooves to give a key to the plaster, and at the ends are made to project and cover the bottom iron flanges of girder about 2in. below, so as to protect the same from fire. They are placed diagonally between the joists or girders, giving increased strength, and their soffits form a continuous ceiling. The tubular section of lintel enables the air to circulate freely throughout the whole area, and also beneath the lower flanges of joists where air passages are formed. These floors are remarkably strong and compact. The 6in. cross partitions are in many cases constructed of sifted-breeze concrete—2 cental sacks of cement to  $\frac{1}{2}$  yard cube of sifted breeze—and are so compact and strong as to resist the heaviest blow that may be given them. In some of these stanchions are placed, carrying the upper girders.

Very important parts of the construction are the roofs. These are wholly constructed on the Fawcett system. Steel trusses, formed of I section about 12ft. apart, are placed over the walls externally forming the sloping sides, and these carry steel purlins which support the fireclay lintels and concrete for slating or leadwork. Various slopes have been formed, some nearly vertical, others of slight fall to the gutters. The purlins are placed 2ft. apart, and the concrete of breeze and cement forms a capital surface for the slates, as no battens are necessary, the nails being driven through the concrete, which gives a secure and firm hold. These roof-slopes and flats deserve the attention of the profession, as proving that this system can be applied to any slope. It would have been practically impossible to have constructed flat roofs of very little fall in the ordinary manner. The numerous dormer windows which light the outside corridors are entirely of breeze and cement concrete, the cheeks and walls being about 6in. thick. The manner in which the upper corridors have been widened by running 12in. by 15in. joists over the wall below, and supporting the upper corridor wall 2ft. 6in. within the lower wall, is ingenious. The plan of Messrs. Leeming shows skilful arrangement in the corridors. The open-light courts below and the inside corridors are well planned. On the top floor the corridors are placed outside, and are lighted from the dormers. The designs and plans of these buildings we have already given.

#### IMPERIAL THEATRE, BORDESLEY, BIRMINGHAM.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THIS theatre, which is now rapidly approaching completion, promises to be one of the most completely contrived of our provincial theatres. Messrs. Owen and Ward, architects, of Birmingham, have prepared the plans. The building has two frontages, one to High-street of 104ft., and the other to Clyde-street of 134ft. There are arranged twelve exits from the various parts of the house, communicating directly with the streets, and each section of the building has at least two spacious fireproof staircases connected therewith. The grand hall, which is approached from High-street, and is 25ft. by 20ft., will be decorated with parti-coloured marbles, the ceiling being domed and harmoniously decorated in colour. The staircases to circle and stalls lead from this hall. The interior accommodation is classified into orchestra and pit stalls, pit, dress circle, balcony, and gallery, together with six private boxes, and will seat 2,500 persons. The auditorium is 69ft. by 65ft., and the stage 69ft. by 40ft. The latter will be of the latest construction, capable of mounting the most elaborate productions. The grid will be 50ft. above stage level. A convenient green-room is provided, and ample dressing-rooms for both sexes. Spacious saloons are arranged of easy access to all parts of the house, and also conveniences for both ladies and gentlemen, together with requisite cloak-rooms. Both gas and electricity will be employed for lighting purposes throughout. The heating and ventilation will be carried out on thorough principles. The interior decoration will be principally

of fibrous plaster in the Renaissance style, the prevailing colours being cream, blue, and gold, whilst the draperies and upholstery will be in old gold silk. The elevation to High-street is treated boldly in red Ruabon brick, with buff terracotta dressings. The terracotta work is by Messrs. Doulton and Co., and the general contractor is Mr. E. J. Charles, of Moseley, Birmingham.

## SPECIFICATIONS.\*

(Continued from p. 602.)

IF any detail drawings are supplied with the contract plans, which is not often the case, a specification may be much shortened without detracting from its efficiency by merely referring to the detail drawings in question, and at the same time mentioning any particular feature not readily gathered from those drawings. Thus in about three lines may be stated all that is necessary, which otherwise would perhaps occupy a dozen or twenty. But I fear, until it is the custom to supply detail drawings with the contract plans, very much cannot be made of this point. Here is

## ANOTHER WAY TO SHORTEN A SPECIFICATION.

Take, for example, the windows to a building, one or two of which are dissimilar from the rest. I would first describe those, and then refer to all the others on all floors, in all positions, in the one item, and not describe them to each floor separately. Take, again, the external facings to brickwork. Describe any special facing first, and then the whole of the other facings to all parts in the one item without reference to special position. There are many other items which may be treated in this manner. One more suggestion. The wording itself of a specification may be much curtailed by care and practice. You will never be able to write concisely and to the point until you have written many specifications. Do not labour the wording needlessly, nor repeat yourself unnecessarily. In time the requisite language will come simply and quickly. I want it to be understood that my remarks chiefly apply to the correct form and wording of a specification of which quantities do not form a part of the contract, or which, perhaps, have not even been supplied. Another important point in a specification is that

## IT SHOULD BE READILY UNDERSTOOD

and clear. To avoid confusion, tabulate as much as possible the various parts of a complete item of work by placing each separate particular under the preceding one. It will take more paper, but then that is always a good fault, for it will make the description clear at a glance. The form of tabulation I would suggest is as follows, which illustrates the description of a roof formed with trusses:

The roof to be formed of, say, six whole trusses and two half-trusses, each to be placed 10ft. apart, and composed of the following scantlings, and the whole notched, framed, spiked, and strapped together:—

Tie beams 12in. by 6in., resting on 2ft. 6in. by 12in. by 3in. tooled York templates.

King posts out of ..... 6in. by 5in.

Principal rafters ..... 6in. by 4in.

Struts ..... 4½in. by 4in.

and so on. Here it will be noticed that each separate component part of the roof is placed immediately under the preceding one until all the items have been described. Thus, at a moment, the sizes and particulars of any one special part of the roof may be seen. This form of tabulation will be found much clearer than the method which is so often adopted of running on the particulars of the various items line after line without a break. In the same way may be tabulated the description of floors, windows, doors, and many other distinct items severally composed of many parts. As another aid to the clearness of a specification, divide the descriptions into many clauses, and do not make the clauses too long, nor omit an occasional full stop. Also keep the clauses well apart, and do not crowd them together; any item will then be quickly seen, and you will not have to question to which part of the building a description belongs. Conceding this point that a specification should be

\* By F. W. MACEY. A paper read before the London Architectural Association on April 28, 1899.

perfectly clear at a glance, a further question arises, Should the work be divided into

#### SEPARATE TRADE HEADINGS?

As a general principle, this is unavoidable, and I think desirable, but I would also say, without hesitation, that very many distinct items of work would be clearer and more comprehensible if the various trades relating to them were not separated, but the complete item of work described under the one heading, placed in whichever part of the specification seemed most desirable. Thus, to illustrate. Take an iron casement window, with wood frame, linings, and the usual glass and fittings. Ordinarily this would come under several trades; but I would describe everything connected with that window under the one heading of, say, joiner—that is, the iron casement, the wood frame, linings, shutters, and finishings, the ironmongery, and glass, and with, perhaps, a cross reference in smith, stating that the iron casements are described in joiner. The builder will see at a glance all the requirements of that window, and the client, if he peruse the specification, will also have an idea how it will look when finished. Another example: Take an iron girder. I would describe under smith and founder the girder itself, the templates, cover-stone, any cement packing, felt or lead seating, and the painting. Perhaps it might be better to generalise the painting under painter in the one description applicable to all girders and covered-up ironwork, and in that case a reference should be put under smith and founder. There will then be no excuse for the painting to this work escaping the builder's attention. When describing the work to small alterations, repairs, or decorations, it is almost essential to adopt this order of running on the description, regardless of trade headings and formalities. Of course, when work is let to separate tradesmen you cannot adopt this method.

#### A BUILDING CONTRACT,

which is often referred to in a general way as the specification, is understood to include the conditions of contract, the form of contract—that is, the actual agreement, and the specification of the subject matter embraced in the contract. The conditions of contract and the form of contract should only embody, so to speak, the actual legal requirements which, taken by themselves, do not affect the description and the value of the work and materials. These strictly legal clauses I do not propose to touch upon. But it will often be found in many specifications that under the leading conditions of contract are placed many clauses which do actually affect the amount of the estimate. This is a mistake, for at the time of tendering, a builder so often only hurriedly scans the conditions of contract, and when reading them over again, preparatory to signing the contract, may, unfortunately, find there are several items included which he has omitted to price in his estimate. The client does not always see his point, and the builder either has to bear the loss or throw up the work. This remark chiefly applies to a work for which no bills of quantities have been prepared. But that part of the contract, or, in other words, the specification itself, of the actual work and material, should embody every item which may in any way affect the estimate; therefore, under

THE GENERAL CLAUSES, OR PRELIMINARY ITEMS, as they are often called, I would include the following matters which are so often to be found only under the Conditions of Contract:—The date of completion—this requirement may necessitate an extra allowance for overtime or other special employment of labour. The mode of payment—under certain conditions the builder may require to borrow money to enable him to carry on the work between the times allotted for payment. Keeping the work in repair for a stated period after completion—this may necessitate an allowance to cover any matter which may crop up under this item. The insurance fees and fees to any authority should also be included under this heading of Preliminary Items, as also any other matter not coming under a trade heading which may possibly require a price. Just a hint as to the outside cover of a specification. Put as a reminder in red ink a note of the insurance and date of completion. One is apt to forget these matters. Then as to

#### THE MARGINAL REFERENCES.

It will be found a great convenience to all parties if a marginal note is given to each distinct item of work. It will then be seen at a glance where

a "bath casing" is placed, or the "spandrel framing to a staircase," instead of having to wade through pages of other subject matter. In addition to the marginal notes, I would put all the principal items under sub-headings, so to speak, in their respective trades. Such as all wood staircases under a sub-heading of "Staircases" in Carpenter and Joiner; similarly all casement windows under a sub-heading of "Casement Windows," and all such divisions of work. And when you come to the minor items which only require a separate clause to each, these might be put under the one sub-heading "Other Items" or "Other Fittings." These sub-headings should be written across the page. As to

#### NUMBERING THE CLAUSES,

this I think very important. It will be found of great assistance to be able to refer to the number of a clause in a letter when calling the builder's attention to any special part of the work, as also in the case of cross-references when referring from one part of the specification to another. Each separate clause need not necessarily be numbered, but only each distinct item of work which may embrace several clauses. As to marginal sketches to illustrate rather involved parts of the specification, I think in many cases these will be found very useful. I would then suggest that the lithographer take them direct from the architect's sketches. If the specification is typewritten or fair copied in the office, then either do all the sketches yourself or else see for yourself that they are copied correctly. Where should

#### PROVISIONAL AMOUNTS

and prime cost items come in a specification? Should each amount come under the trade in question to which it refers, or should they all in a body be put together? I think no hard and fast rule can be applied to this, but small provisional amounts should run on with the subject-matter to which they refer; and distinct and perhaps more costly provisional amounts, and of which there may be no other description in connection, should be all placed together under the one heading, "Provisional Amounts," either immediately following the preliminary items or else at the end of the specification. The general run of

#### PRIME COST ITEMS

usually apply more to small matters, and these, I think, should follow the items to which they refer. But if of any considerable amount, I would then put them also under the heading "Provisional Amounts." Should a specification have an index similar to that provided with a technical or scientific work? I think this would be very useful, and it certainly would make a specification a more complete and handy document. The index need only refer to the principal items. Sometimes it is difficult in a specification to locate the description of a particular part when there is no distinct mark or name on the drawing. Some employ the points of the compass; this is very well if they will apply, but when you get a position perhaps centrally situated, it rather fails in its object. I prefer in such cases to put a number or a letter, and that perhaps in a circle, against the part in question, and so refer to it in the specification. Many of these references will not be required, as the drawings will generally be sufficiently clear to locate the descriptions by referring to the ordinary parts of the building by name or position. Should an old specification be referred to when describing the work relating to another building? I think only so far as the general clauses are concerned, such as those under the preliminary items, the preambles to the various trades, and the other general covering clauses under those trades. But the details of the work I would write entirely in the first place without any reference whatever to a former specification. All detail descriptions cannot be exactly alike, and you will be far more likely to put in any necessary variation of the detail in question if you think it out as you go along, than if you copy an old description and alter it afterwards to suit, because when you copy an item you cannot properly be thinking out the details yourself. To obviate omitting, so to speak, any of the general items common to all work, have by your side a form or tabulated index of the items coming under the various trades. This can be looked down at a glance, and all the items extracted which may be required.

(To be continued.)

#### MAHOGANY AND VENEERS.

THE large exports of electrical and other machinery to South America have, says the *New York Times*, been the means of fostering an import trade in mahogany wood that affects the furniture and cabinet business in all parts of the United States. Most of the steamers that return from the South stop at Nicaragua and the United States of Colombia to load up with mahogany and cedar. Last year over 6,000,000ft. of mahogany logs were brought to New York, and the coming year the imports will probably run much higher.

Increased trade with the South American countries must naturally stimulate these imports, for the rare hard woods of the Tropical forest do not enter into competition with any native product. Their use is extending into many new fields and uses never before dreamed of. The perfection of the veneering machinery, by which very thin slices of wood can be cut off at half the former prices, enables cabinet and furniture manufacturers to turn out loads of mahogany articles. These furniture articles are what the trade calls "built-up" furniture. That is, they have a core of white pine or other cheap wood, and the surface is then veneered with thin layers of mahogany.

Before the veneering machinery was invented, all veneers were hand-sawn, and they cost considerable; but to-day 75 per cent. of the veneers is cut or sliced by huge knives. The sawed veneers are much better than the cut, and they last longer, but for the cheaper trade the cut answers all purposes. The slicer, as the veneer-cutting machine is called, is a costly machine, but it performs its work with wonderful effects. A large mahogany log is put into the powerful grip of the slicer, and as it moves against a rigid knife, which is 17ft. long, the veneer is cut off as evenly as a shaving is sliced from a block of wood by a plane. The whole log is thus sliced up into veneers one-thirtieth of an inch thick. Thus one log may yield several hundred veneers. Sawed veneers are more expensive, because not more than ten to fifteen can be cut from an inch of wood. The rest of the wood is lost in sawdust, while in the cut veneers there is no waste at all.

The relative cheapness of mahogany logs is also making revolutions in furniture manufacturing. The sailing vessels and steamers engaged in the trade are more numerous than ever before, and each steamer may bring 700,000ft. of mahogany logs to New York, and the sailing vessels from 200,000 to 300,000ft. The mahogany forests of South America are not being ruthlessly destroyed, as are many of our American woods. In Central America, where the forests are controlled by Americans, two trees are planted for everyone cut. This wise policy insures a permanency of supply that practically makes the wood inexhaustible. The trees cut for this mahogany trade average 25in. in diameter, with some running as large as 40in. They vary in age from twenty-five to seventy-five years. In twenty-five years, it is estimated by those controlling the forests, a mahogany tree will attain a good commercial age, when it can be cut with profit to those planting it. As most of the logs are used for veneering purposes, their size does not count as much as it does with many native woods.

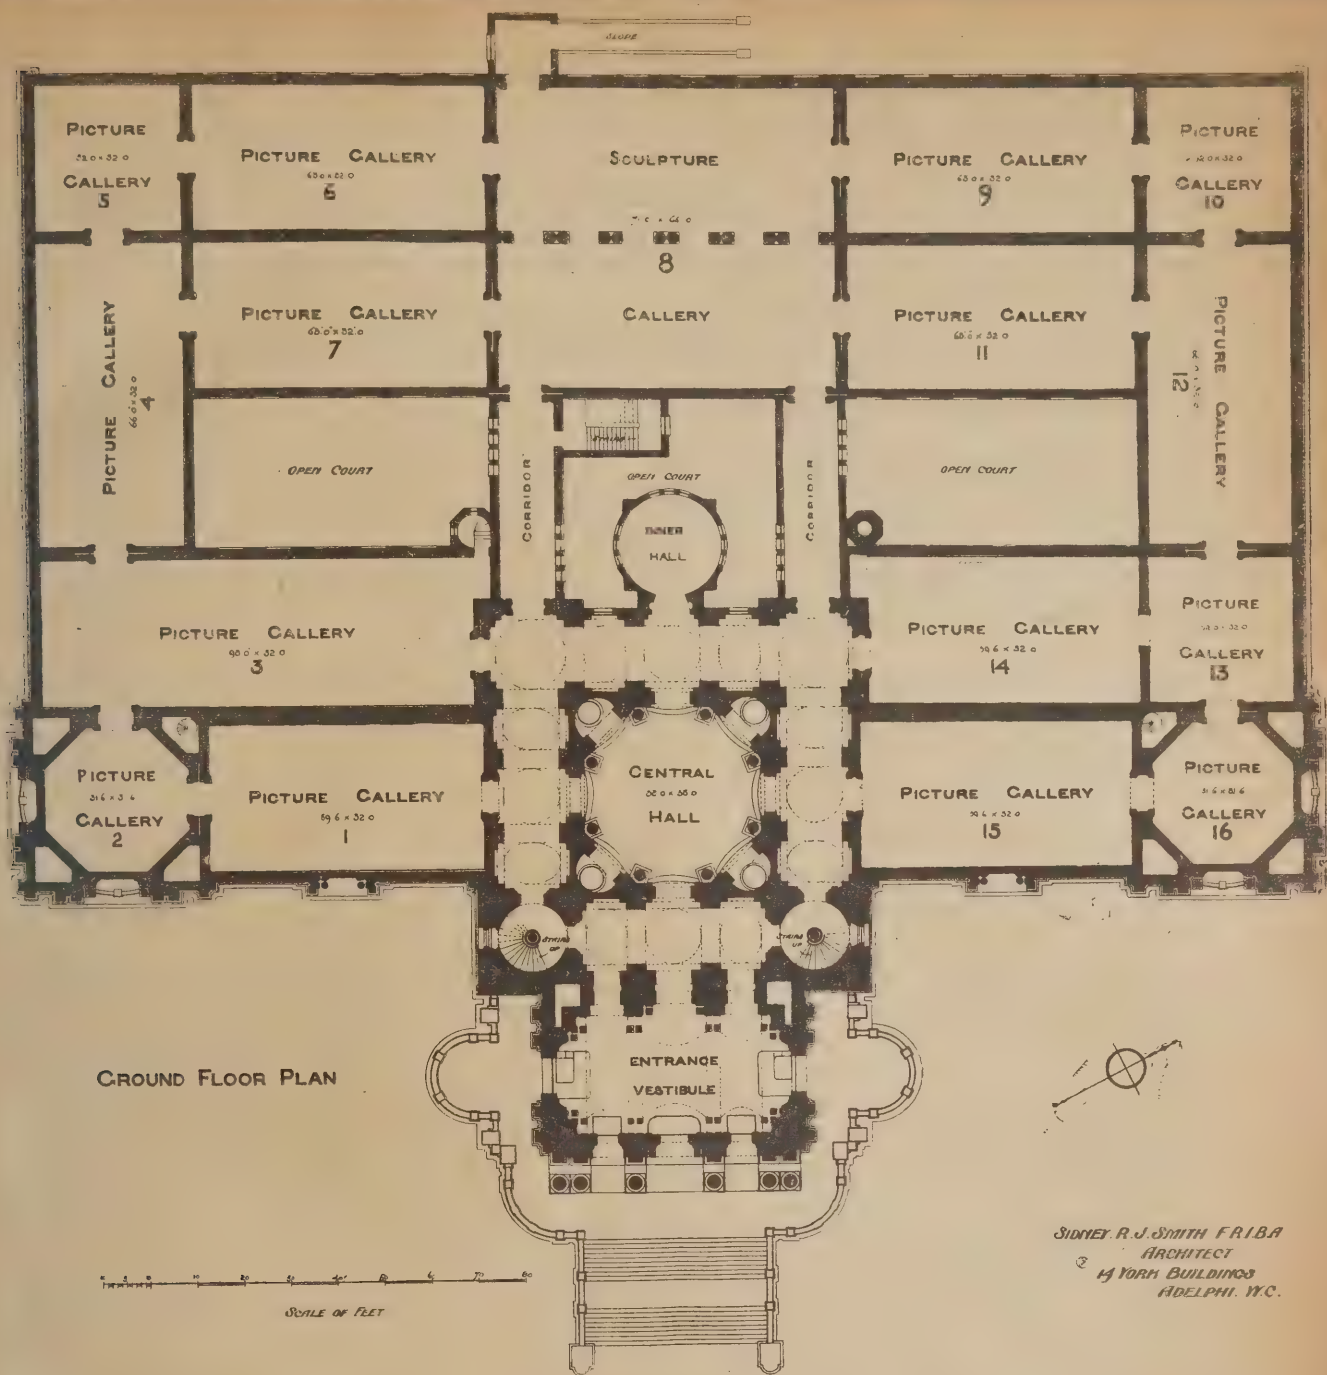

Lady Lees recently laid the foundation-stone in connection with the new church of St. Peter's, Oldham. It is to cost over £12,000, and of this sum £8,723 has been subscribed.

At Lutterworth, a cottage hospital is in course of erection, at the sole cost of Mrs. Feilding Palmer, as a memorial to her late husband. The architects are Messrs. Townshend and Fordham, of Peterborough, and the contractors Messrs. Linnell and Son, of Rugby.

A large and lofty steel chimney has just been built at the Natrona, Pa., plant of the Pennsylvania Salt Company. The chimney is 200ft. high, 41ft. 6in. in diameter at the base, and 28ft. 6in. in diameter at the top. It is lined with firebrick, and is used to carry off smoke and chemical vapours.

A memorial, consisting of a stained-glass window and brass tablet, has been erected in the north transept of St. Paul's Church, Castle Hill, Filleigh, the seat of the Fortescue family, to the memory of the late Captain Francis Fortescue, of the Scots Fusilier Guards, and of his wife, father, and mother. The window, a single-light Norman in style, has for its subject a figure of Our Lord, with hands raised in the attitude of benediction. At the foot of the window is a kneeling figure of a white-robed angel holding a scroll.

NATIONAL BRITISH GALLERY, GROSVENOR ROAD.

NATIONAL BRITISH GALLERY,  
GROSVENOR ROAD.

THE plan shows this building as completed, with the addition of the new galleries, which are now all roofed-in, and will be finished some time in July. Under these galleries are provided rooms for the curator and his staff, female students' mess-room, lavatories, &c., police room, attendants' rooms, refreshment-rooms, directors' studio, &c., black and white rooms, and many rooms for exhibition or other purposes. The new galleries are generally finished decoratively in much the same treatment as the existing galleries; but the central ones, which are to be used for sculpture are different, and divided by Portland stone Doric columns and an entablature, which continues all round the walls, and the pavement is in mosaic. The connecting corridors to existing central hall have circular coffered barrel roofs, and the walls treated in same way as the small inner circular hall. The buildings are faced in Portland stone. There is a slope provided at back for the benefit of invalids who have to use Bath chairs, &c. The glazing to roofs has been done by W. E.

Rendle and Co., and the ironwork by Handysides, the floors by Dennett and Ingle, and the iron doors and sashes by Mr. J. Stone; the pavings are being done by De Grelle, Houdret, and Co., the drains by Mr. G. Jennings, and the general contractors are Messrs. Higgs and Hill. The whole cost of these new buildings (as well as the existing building) has been borne by Sir Henry Tate, Bart., and the architect is Mr. Sidney R. J. Smith.

A Presbyterian church is approaching completion at Ashington, near Newcastle. It will be seated for 300 persons, and at the rear are schools for 150 children. Mr. C. S. Errington, of Newcastle-on-Tyne, is the architect, and Mr. R. Walker, of Bedlington, the contractor.

A private oratory has been added to Ellingham Hall, near Chatham, the seat of Sir John Haggerston, Bart., and was dedicated on the 27th ult. It has been designed by Messrs. Dunn and Hansom, architects, Newcastle-on-Tyne, in the Perpendicular style, and projects from the east end of the old hall. The contractors were Messrs. Elliott, of Preston.

At St. David's Church, Ely, near Cardiff, a stained-glass window has just been unveiled. It is of three lights, the subject of the design being the Ascension. Messrs. James and Sweet-Escott, of St. Mary-street, Cardiff, were the architects.

A chapel of ease to be dedicated to St. Andrew is about to be built in Charles-street, Truro, from plans by Mr. Silvanus Trevail, of that city. It will be seated for 120 people, and there will be a parish-room below.

Mr. Arthur B. Potter has offered to the Rochdale Corporation a bust, with marble pedestal, of his father, Mr. T. B. Potter, who represented the borough in Parliament for thirty years. The General Purposes Committee have accepted the gift.

The Perpendicular window at the east end of the south aisle of Camborne parish church has been filled with stained glass, illustrating acts of Charity and Mercy. The architects were Messrs. Ward and Hughes, of London.

A third memorial window has been placed in the north aisle of St. Paul's Church, Peterborough. It is the gift of the family of the late Mr. Arthur Carney, and contains the figure of St. John, the Apostle and Evangelist, with appropriate symbols and inscription.

## OBITUARY.

WE have to announce the death of Mr. G. RHODES, M.S.A., of Bedford Park, W., which occurred recently after a long illness. Mr. Rhodes was one of the oldest members of the Society of Architects, having been elected in 1884, the year of its formation. The sudden death is also reported of Mr. T. C. LEWIS, M.S.A., of Bristol, who had been a member of the Society since 1893.

The death occurred at his residence, 2, Claremont Park, Gateshead, on Friday night, of Mr. WM. CAMPBELL TYRIE, builder and contractor, of Gateshead, at the early age of 45 years. Mr. Tyrie was the son of a soldier of an Irish regiment, and, after serving his apprenticeship as a joiner, he went to the North of England, and became foreman to Messrs. G. and R. Lamb, builders, Gateshead. There he remained for some years, and then began business in partnership with a Mr. Graham, who is now in Johannesburg. After the dissolution of this, Mr. Tyrie carried on business on his own account. He laid the water mains between Newburn and Whittle Dene, and also brought the water from Catcleugh, and carried out the entire transformation of the interior of the Theatre Royal, Grey-street, Newcastle. A feature of his business, which revolutionised the exterior of large business premises in Newcastle, was the putting in of large shop windows.

## CHIPS.

New outfitting premises have just been erected at a cost of £2,000 in the High-street, Maidstone. Mr. Hewett, B.A., was the architect, and Messrs. Stevens and Barber were the builders.

The new schools, Mold, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

A block of twenty-two cottages will shortly be built by the improvement and buildings committee of the Manchester Corporation at Miles Platting at a cost of £4,372.

The parish church of North Creake, Norfolk, has been restored at a cost of £2,000. The most recent work has been a new floor of marble to the chancel, a carved oak chancel screen, panels on the chancel walls, clergy stalls, lamps, and a carved canopy to the font. The architects were Messrs. Hicks and Charlewood, of Newcastle.

The fine 15th-century church of Ranworth, facing the Norfolk Broad of that name, is being restored at a cost of £4,000 from plans by Mr. J. T. Micklethwaite, F.S.A. The work includes repairs to the unequalled rood-screen, which has been illustrated in our pages.

A large clock-tower, presented to the town of Wainfleet by Mrs. Walter Martin, was completed and the clock formally started on May 2. The clock has three large dials, and strikes the hours, and is fitted with all the latest improvements, and was the manufacture of Messrs. John Smith and Sons, Midland Clock Works, Darby.

In connection with the opening ceremonies of the New Free Church, Pudsey, near Leeds, a new illuminated turret-clock, showing the time upon two external dials, 5ft. each in diameter, and striking the hours upon a large bell, was formally set going. The work has been carried out by Messrs. W. Potts and Sons, clock manufacturers, of Guildford-street, Leeds, and Cloth Market, Newcastle-on-Tyne.

The partnership hitherto subsisting between F. Wheeldon and L. M. Tacon, architects and surveyors, of Birmingham, under the style of Wheeldon and Tacon, has been dissolved.

The new dry dock at Swansea, which cost £80,000, and is one of the largest docks in the Bristol Channel, being 450ft. long and 120ft. wide, was opened on Wednesday week.

The urban district council of Exmouth have raised the salary of their surveyor, Mr. Harding, from £160 to £200 per annum.

Colonel C. H. Luard, R.E., held a Local Government Board inquiry at Thetford, on Wednesday week, respecting the application of the town council for a loan of £2,500 for the improvement of the town hall. Mr. Green, architect, of Norwich, produced the plans, and explained that the work had been primarily undertaken in consequence of repeated settlements, bulges, and cracks in the walls, and he was therefore instructed to provide for reconstruction and enlargement.

Before a Select Committee of the House of Lords on Friday, the Metropolitan Water Companies Bill of the Government, enabling the companies to use their supplies to meet a case of emergency in another district, was considered and approved, subject to the insertion of sinking fund clauses.

## PROFESSIONAL AND TRADE SOCIETIES.

**BRISTOL SOCIETY OF ARCHITECTS.**—The annual general meeting was held at the Fine Arts Academy, Clifton, on Monday, the 8th inst., Mr. W. L. Bernard, president, in the chair. The annual report and balance sheet, which was presented and adopted, showed that the society was increasing both in numbers and influence, and that the financial condition of the society was satisfactory. The students' prizes were then distributed, after which a paper on "Speculative Builders and their Little Ways" was delivered by Mr. Frank Wills.

**EDINBURGH ARCHITECTURAL ASSOCIATION.**—The annual meeting of this Association was held on the 3rd inst., in the Royal Institution—Mr. Thomas Ross, president, in the chair. The statement of accounts showed that the Association commenced the year with a balance in hand of £124 9s. 10d., and ended with a balance of £109 0s. 6d. The membership was 267. Mr. James Bruce, W.S., was elected president for the year; Mr. John Watson and Mr. H. F. Kerr, vice-presidents; Mr. T. Fairbairn, secretary; and Mr. John Johnson, treasurer. Mr. Ross, the retiring president, made a few remarks regarding the desirability of union between the Architectural Association and the junior Architectural Society. He said that so far as they existed for the public good their influence would be much greater after such a union than now, as only on one point was there any difference between the two—viz., that the Association consists of architects and laymen, while the Society is composed of architectural assistants and others connected with the profession. It was surely possible to come to an agreement, and as the junior society had recently approached them with this object in view, he felt very hopeful that the practical outcome would be beneficial in many ways. So far as the public had any interest in architectural societies, it was desirable that the profession should speak with one voice.

**THE GLASGOW ARCHITECTURAL ASSOCIATION.**—On May 2 the president, Mr. George S. Hill, A.R.I.B.A., in the chair, Mr. Thomas Ramsay read a paper on "Some Points in the Erection of a Modern Office Block." The author said a building of this class was erected in the first place with the specific purpose of making money for its owners, with occasionally the further purpose of serving as an advertisement. The requirements necessary to allow of its doing so the author considered to be good situation or site, ease of access, good light, maximum of rental area, ease of rearrangement to suit tenants, and the minimum of cost consistent with true economy. The author enlarged on these several requirements, pointing out, among other things, the necessity for the introduction of a certain amount of fire-resisting, if not fireproof, material in the construction, and the absolute necessity of good light, this latter requirement, in his opinion, considerably affecting the money-earning capacity of the block.

**GLASGOW MASTER WRIGHTS' ASSOCIATION.**—The annual meeting of this association was held on Friday, Mr. James Ferguson, president, in the chair. The secretary, Mr. James L. Selkirk, read the annual report, from which it appeared that the membership had risen from 111 to 131, besides 15 honorary members. The financial statement showed the income to have been £85 13s. 6d., and the balance in bank and on hand £41 17s. 6d. The reports were adopted. The following gentlemen were elected office-bearers for the ensuing year, namely:—President, Alexander M'William, of Messrs. James Kyles and Co., Partick; vice-presidents, Mr. Thomas Stewart, Shields-road, and Mr. John Smeaton; and Mr. James L. Selkirk, C.A., secretary and treasurer, 64, West Regent-street.

**LIVERPOOL ARCHITECTURAL SOCIETY.**—The annual meeting of this society was held on Monday, Mr. W. E. Willink, C.C., occupying the chair. The report read by Prof. F. M. Simpson showed that the number of members was 136, as compared with 131 last year, the number of fellows being 59, associates 37, students 19, and honorary members 21. The balance-sheet presented by Mr. James Dod (treasurer) showed that there was a balance to the good of £138 7s. 8½d., as against a balance last year of £67 10s. 4½d. The election of officers for the ensuing year resulted as follows:—President, Mr. E. A. Ould; vice-presidents, Messrs. Wm. Owen and J. Woolfall; hon. secretaries, Professor F. M.

Simpson and Mr. Arnold Thornely; hon. treasurer, Mr. James Dod; hon. librarian, Mr. J. W. Blakey; and council—fellows, Messrs. J. W. Blakey, T. E. Eccles, A. P. Fry, Henry Hartley, F. C. Thicknesse, W. E. Willink, C.C., and J. Woolfall; associates, Messrs. F. E. P. Edwards and E. P. Hinde. The committee having been appointed, Mr. Willink, as the retiring president, delivered his closing address, in which he congratulated the members on the marked success which had attended the past year's work of the society.

**SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.**—The annual meeting of this society was held at the School of Art the other night, Mr. R. W. Fowler occupying the chair. The treasurer's statement of accounts, which showed a balance in hand of £124, was adopted. The twelfth annual report of the council was read by the hon. secretary, Mr. W. S. Fenton, and adopted. It stated that numerically there has not been much change in the membership, as having reached the high water-mark of last year (114) it could not reasonably be expected that the number of members would materially increase. During the year there had been one death, two withdrawals, and three lapses of membership, or a total loss of six members; but this had been compensated by the election of three lay members, one fellow, one associate, and three students, or a net gain of two members, making the total membership 116, which is the highest in the history of the society. The lectures of the session had been up to the high standard usually seen in the society's programmes. The council had their attention called to the case of an architect's client who had declined to comply with the usual custom of paying half (2½ per cent.) the usual commission on the signing of the contract, and the remainder on instalments, in accordance with the R.I.B.A. scale of charges. The council called the client's attention to the matter, and the R.I.B.A. scale of charges were sent to him, with the result that the commission was paid in due course. The council also sent out copies of the R.I.B.A. scale of charges to the practising members of the society, and to the school board, solicitors, and accountants, and hope this course will have the effect of improving the status and position of the architects and surveyors of the city. The council have devoted a considerable amount of time to the discussion of proposed conditions of contract proposed for adoption by the Master Builders' Association. On May 18, 1898, Messrs. J. Biggin, G. Webster, H. Brumby, and J. Spink, on behalf of the association, met the council and discussed the various points at issue, but no satisfactory issue had been arrived at. The amended conditions were still more objectionable and one-sided, and contained a clause requiring arbitration on every point that might arise during the course of the contract, and which would, in the council's opinion, prove most detrimental to both the architect's and client's interests, and would not, either, benefit the contractor in most cases. With regard to the Workmen's Compensation Act, the President now informed the society that in the course of his practice he had occasion to consult his solicitors with regard to a client's liability under the Act if the contractor became bankrupt or was otherwise unable to pay compensation under the Act. His solicitors advised him that corporate bodies, being employers of labour, would still be liable; but private employers or clients would be exempt. The following gentlemen were then elected officers and council for the year 1899-1900:—President, J. Smith, F.R.I.B.A.; vice-president, A. Smith Denton; hon. treasurer, Fred Fowles, F.S.I.; hon. secretary, W. C. Fenton; council, the above and Messrs. E. M. Gibbs, F.R.I.B.A., C. Hadfield, F.R.I.B.A., C. J. Innocent, F.R.I.B.A., F.S.I., T. Winder, A.M.I.C.E., J. B. Mitchell Withers, A.R.I.B.A., and J. R. Wigfull, A.R.I.B.A.

The erection of a new theatre at the corner of Saltley-road and Nechells-place, Birmingham, is about to be commenced. The designs have been prepared by Mr. T. Guest, of Corporation-street, Birmingham. The building will cost upwards of £10,000, and is to seat 2,000 persons.

The returns of £217,815 represent the excellent general business which characterised last week's proceedings at the Estate Mart. Nothing more important than a good supply of freehold ground-rents was on offer, but those and small residential holdings sold remarkably well throughout the week.

## ST. LUKE'S CHURCH, MUNICH.

THIS is the third Protestant Church at Munich, and Regius Professor Albert Schmidt was the architect. It was three years in course of erection. We take the following from the architect's description. The Mariannenplatz site on which it was built was given by the City Fathers to the Protestant community. The building is inclosed on three sides by thoroughfares, which originally were covered with buildings. On the fourth side, eastward, it lies between the lines of the Ludwig and Maximilian bridges, spanning the river Isar, over against the pleasure grounds on the Gasteig heights. Thus it will be seen that this is not only one of the most central positions, but a highly picturesque site as well. In clear weather, the mountain range in the distance forms a grand setting for the dome of the church. Munich has lately seen other important places of worship added to its buildings, such as the new Synagogue and new Catholic churches. The site runs in a direction east to west, between the Steinsdorf and Thiersch strassen, or streets, and in consequence of these defined restrictions it became necessary to obtain the requisite area towards the south and north. Thus the "central" church is adapted to the exigencies of the site. Entering through the main portal, in the Steinsdorf-strasse, an open porch is divided off by an arcade with openings leading on either side to the towers, with their circular staircases, and proceeding through a vaulted vestibule, embellished with figures, we pass into the body of the church passing under the arched organ-loft. The crowning feature of the interior is formed by the square lantern 14 metres wide, and which, at a clear height of 42 metres, is surmounted by a ribbed octagonal vault. This octagonal cupola is supported by arched pendentives, the ribs being carried by wall-shafts resting on corbels. On each side of the body of the church is a vaulted transept with square ends, lighted by rose windows of radiating design. The nave of the building extends from east to west, towards the principal entrance. The nave proper follows the width of the central area, and is of the same span as the chancel, and both terminate in octagonal apses. The aisles flank two sides of the octagon, and join the transepts. The building is essentially Gothic in its form of construction, the central nave and aisles being solidly roofed with ribs and vaults, and these groins are borne by a girde of pointed arches. The pendentives, which emphasise the transition of the dome from the lantern below, are decorated with busts of the four Evangelists, larger than life size. Over the aisles there is additionally an intermediate ceiling the beams of which are exposed. These timbers carry the galleries, rising in tiers, after the fashion of an amphitheatre. These in the transepts follow the octagon of the

ground plan. The nave and the aisles are borne by circular columns of Abbach sandstone. Between these in front of the galleries occur segmental arches. The architect points out that the diameters of these arches correspond in length with the circumference of one of the clusters of the quadrangle pillars. The chancel, or apse, is raised, and is reached by a flight of eight steps, situate between the responds of the central area. On this same level stand, adjoining left and right, are aisles which are shut off from the transepts by low stone screens. The apse takes the form of a raised presbytery, which is agreeably in the shade, receiving its light from above, an arrangement that very notably heightens the charm of the structure, and brings out the prominence of the altar. The sacristy, the rooms for meetings, and other conveniences are to the rear externally. To the right of the altar is located the baptismal font, while on the right-hand are the steps leading up to the pulpit, which joins on to the left-hand pillar of the crossing. The altar, pulpit, and baptismal font are built of coloured polished marble, brass being used for the figure decoration. These are all noteworthy of the sculptor's art. The windows of the presbytery, and of the adjoining aisles, are fitted with stained-glass pictures on a level with a gallery story, giving a rich scheme of colour. The centre-piece of the altar is adorned with a painting by Goldberg, representing the Descent from the Cross. The small rose window over the organ at the entrance end is likewise fitted with stained glass, while the large circular ones in the transepts are also intended to be similarly treated. The organ has a gallery of its own, with the balcony for the choir, and it stands over the entrance arcade filling the adjacent triangular spaces. Besides the main portal, there are two entrances, with vaulted porches projecting towards the interior, screened between the smaller columns in the transepts. The sacristy and the meeting-room, which have separate entrances, with external independent flights of steps, are covered with cruciform vaults, and are built round the apse of the presbytery on the same level with it as a one-story portion of the building, which allows of lighting the sacristy with windows over. Between transepts and the aisles are two turrets, with winding staircases, leading to the galleries. The large belfry and staircase towers are placed obliquely and at a radius from the body of the building, so as to leave both below and at the level of the galleries a lobby in each case between gallery and nave. The altar-piece, the pews and choir seats, as well as the organ are of oak. The photographs sent us by Professor Schmidt show how carefully the various parts have been worked out and considered. The lantern, which is crowned by a light-giving dome, is 42ft. square, and 126ft. high in the clear, and gives an individuality to the building. Acoustically, we are assured that the effect is exceedingly good, as every word spoken in the pulpit is heard with ease. Considering the lofty dome, this result is gratifying, and affords evidence that a domed auditorium may be satisfactorily employed. The new Synagogue, also designed by Prof. Schmidt, may perhaps be cited by him as a case in point, supporting his contention in this respect. The exterior of the church has high-pitched and simple span roofs, and the dome above passes with broaches from a quadrangle into an octagon. East and west, the nave proper articulates the body of the church, which is carried to a greater height, clear of the main roofs. The lower drum of the dome is composed of two vertically-divided encircling walls; one having large quatrefoil windows, which are set behind an external series of arcades having trefoil heads resting on columns. Between these two walls a sort of triforium passage-way is contrived. The treatment of the transept façades can be seen in the exterior view. Pointed arches over the windows recall the architecture of North Italy, and these openings for the most part have wall-shafts. The interior is partly enhanced by a triforium, through which runs a corridor. On the south-westerly side of the octagonal dome a pierced and visible winding staircase leads up to the lantern of the dome. The belfry towers stand out free diagonally at the level of the upper stories, and are composed of four stories; they, too, are pierced and left open without windows, whereby they are distinguished by deep shadows in effective contrast from the glazed parts of the structure marking their uses, and at the same time contributing very greatly to the picturesque effectiveness of the pile as a whole. The

cupolas and lanterns of the towers springing from the west turrets are, like the dome and lantern, all overlaid with copper. All other roof surfaces are slated. The main entrance façade is adorned with life-size figures of the apostles Peter and Paul. In the external architecture a yellowy grey Bodewöhr sandstone has been used for the masonry dressings, while the flat walling is of a greyish-red brick, adopted in other buildings by the same architect. The quiet tones of the building present a contrast with light and bright colouring of the surrounding buildings. The style of the church is described as belonging to the Transition, to which period we are indebted for a number of most valuable works of art, such as the churches of the Holy Apostles and Great St. Martin at Cologne, the Naumburg Cathedral, the church of the Holy Virgin at Arnstadt, &c., and this style is eminently adapted to fulfil the conditions, so far as area was concerned, of the church of St. Luke, without involving the necessity of violating the monumental character of Mediæval art. Taking this view, the architect regarded it as the cardinal point of his task to supply a modern church well-reconciled with the rules and methods of the masters of the Middle Ages. By the width of 42ft. for the span, and, above all, by the fact that the dome rests upon four free pillars, an experiment has been realised of a highly technical character. At the corner of the Mariannenplatz, and the Thiersch-strasse, a parsonage for the clergy has been built in a style similar to that of the church. We shall give a plan of this church, with some sections, showing the construction referred to, at an early date. The cost of the building is not stated, but we are indebted to the architect for the loan of these photographs and drawings, as well as the particulars for this description.

IMPERIAL THEATRE, BORDSELEY, BIRMINGHAM.  
(For description and sketch plans, see p. 634.)

## HIGH ALTAR AND SCREEN, WINCHESTER CATHEDRAL.

WE publish to-day, from a photograph just taken by Messrs. S. B. Bolas and Co., of Oxford-street, an illustration of the high altar and screen of Winchester Cathedral, as restored under the supervision of Mr. G. F. Bodley, A.R.A. The screen or stone reredos is the latest and finest of four 15th-century structures of this class, the others being at St. Alban's Cathedral, the Collegiate and now Cathedral Church of St. Saviour, Southwark, and New College Chapel, Oxford. In our issue of April 24, 1891, we gave a view, also from a photograph, of this superb Winchester example, when the first portion of the restoration had been completed by the erection of the large figures by Mr. R. Boulton, and a comparison of the two illustrations taken from nearly the same standpoint at eight years' interval, will be found interesting. Other illustrations of Winchester Cathedral published in the BUILDING NEWS are a plan of the precincts by the late Rev. Mackenzie E. C. Walcott, which appeared in our number for Dec. 26, 1879, interior of north transept—a drawing by G. H. Thompson, on Oct. 24, 1884, and some views of the interior of nave roof before and since reparation, given on Feb. 17 of the present year.

## KINGSTON UPON HULL PUBLIC CENTRAL LIBRARY.

THIS building is about to be erected on a site having frontages to Albion and Baker streets. The principal entrance is placed in the centre of the Albion-street front, and from the hall direct access is obtained to the lending library, magazine, librarian's, and ladies' rooms, while stairs 6ft. wide lead up to the first floor, on which are placed the reference library and book store. On the ground floor, the news-room is accessible from the Baker-street entrance; while the various other rooms required for the working of the library have been placed in the most suitable positions. The building will be faced externally with Leicestershire red bricks and Ancaster stone dressings, the only part having any decorative sculpture being the Albion-street entrance shown in the large scale view, and it is hoped that the sculpture will be of good quality. Internally the building will be plainly finished; but as far as possible with materials requiring little renewal, tile dadoes and painted walls being largely adopted. The main staircase hall is to be treated with a barrel-vaulted roof, which may be decorated by paintings at some future time. The architect is Mr. J. G. Gibson, of Gray's Inn-square, W.C. We give copies of the plans and elevations as well as a view of the central gable.

## Building Intelligence.

**ANCOATS, MANCHESTER.**—The Home and Shelter for Women which has been erected in Great Ancoats-street, Manchester, was opened on Friday. It is four stories high, and is divided into departments for casuals, a servants' home, and temporary home. There is also a coffee tavern. There are dayrooms, kitchen laundry, and sixty-three cubicles. Each department will have its own bathroom and lavatory, &c. The buildings are lighted by electricity. In connection with the same mission the foundation-stone of a men's home was laid in November last in Hood-street, Ancoats. The cost of the two institutions is £15,000. The style of the women's home is Elizabethan. The work has been carried out, from the designs of Mr. W. Sharp, architect, of Manchester, by Messrs. Young, Tinker, and Young, of Cheetham.

**BRISTOL.**—The Bishop of the Diocese opened the other afternoon the pupil teachers' centre, erected by the Bristol School Board on the Broad Weir. The building, which, apart from the site, has been erected at a cost of £4,400 from the designs of the architects, Messrs. La Trobe and Weston, is in the Renaissance style, and is carried out in terracotta and red bricks. On the lower ground floor is a science demonstrator's room, 44ft. long. There is a large assembly and examination hall on the Castle Green level, 56ft. by 30ft. Its seating capacity is for 300 persons, and its lighting is by semi-circular windows. There are six large classrooms, each 25ft. square in addition to masters' and mistresses' rooms, cloak-rooms and lavatories for students, besides separate rooms for science and for art students, and a residence for caretaker, also a students' dining-room. The general contractors have been Messrs. Hughes and Weeks, of St. Philip's.

**BULUWAYO.**—The new premises in Main-street for the Mashonaland Agency are near completion. The northern portion of the building is occupied by the telegraph offices, high court, &c. Mr. W. Douslin is the architect, and Mr. W. Rance the contractor; Messrs. Hayward Bros. and Eckstein's pavement lights are used. The frontage to Main-street is 206ft. 8in., and the return frontage to Sixth-avenue is 100ft. The top of the parapet is 40ft. high; the central tower is 60ft. high. The block contains fifty-two offices, also telegraph office, instrument-room, High Court, library, advocates' robing-room, sitting-room, two bedrooms, and bathroom. The chief façade is built of red sandstone with white freestone dressings. The style is Italian Renaissance.

**DRURY LANE THEATRE.**—Extensive additions to Drury Lane Theatre have been commenced. The new buildings, the plans of which have been prepared by Messrs. Pilditch, Chadwick, and Co., 2, Pall Mall East, will be erected upon vacant ground between Catherine-street, Russell-street, and Drury-lane, immediately adjoining the existing premises. Upon this space, which has a length of 132ft. and a depth of 100ft., will be erected in red brick and stone a carpenter's shop, a wardrobe store, a ballet room, and a paint room. Two new exits will also be provided from the theatre. The new buildings will be connected with the old premises by a long covered way. The front elevation to Drury-lane will consist of three shops, with two floors of flats above them. The work will cost about £15,000.

**EDINBURGH.**—At the Dean of Guild Court on Friday a warrant was given to Mr. John White for the erection of new buildings on the east side of North Bridge-street. They will extend from the south abutment of the North Bridge to the Commercial Bank buildings at the corner of the High-street. From Jeffrey-street there will be nine stories, and there will be six stories above North Bridge-street. The street floor on the North Bridge level will be devoted to shops. A bon marché, entering from North Bridge-street, will occupy the whole of the centre block on the five floors above the bridge level, and also the second floor below the bridge, and the floor on the level of Jeffrey-street except a small portion at the north-east corner. The remainder of the upper floors will be devoted to a hotel and two restaurants. Messrs. George Beattie and Son, of Edinburgh, are the architects. The buildings will cost about £170,000.

**FARNWORTH.**—A new theatre is in course of erection in Peel-street. The front is treated in Classical style. The pit floor has a quick slope.

In the front, and with seats upholstered in red plush, are stalls seating 100, and immediately behind is the pit, with seatings for 840. The dress-circle chairs give accommodation for fifty-seven in three rows; while the circle has room for 240. Behind this is the first promenade. At a slightly higher level is the gallery, with seats for 300, and an upper promenade. Altogether there are seats for 1,621 persons; but with standing room 2,000 people can be accommodated. Refreshment-rooms are provided for the various parts of the house, and a lounge and smoking-room for gentlemen, as well as ten dressing-rooms. The lighting of the theatre throughout is to be by electricity, but a full gas-lighting arrangement is also put in. Heating is on the low-pressure hot-water system, the heating chamber being in the basement. Messrs. Bradshaw and Gass, F.R.I.B.A., of Bolton, are the architects, and Messrs. J. B. and J. Entwisle, of Kersley, the contractors.

**IPSWICH.**—The new workhouse on the Woodbridge-road was opened on Wednesday by Mr. T. W. Russell, M.P. It has been erected from plans selected in competition and prepared by Messrs. Salter and Adams, 28, Woburn-place, London, in conjunction with Mr. W. Lister Newcombe. Messrs. Geo. Grimwood and Sons, Sudbury and Ipswich, took the contract at £25,773; Mr. Harry Cockrell was the clerk of works. The plans and specification for the electric lighting were prepared by Mr. E. R. Dolby, 8, Princes-street, Westminster, and the work has been carried out by Messrs. Crompton and Co., Chelmsford. The buildings are constructed with local red bricks, with Welsh slate roofs. The main buildings are recessed 200ft. from the road; they consist of a central administrative block and two pavilions, the longer one for male, the shorter for female inmates. The central block contains, in front, a committee-room, a master's office, a messenger's room, and the master's apartments; behind, a dining-hall, with an open-timbered roof of pitch-pine, and a gallery at one end; behind this is a kitchen and two sculleries. On each side of the dining-hall, kitchen, &c., is a corridor; on the other side of these corridors are, in one case, the master's storerooms, and on the other the matron's storerooms and the cook's room.

**LEEDS.**—On Saturday the public baths for Meanwood district were formally opened. The baths stand on a part of the old athletic ground, and have cost, inclusive of the land, about £13,000. The area covered is 3,748sq. yds. The baths have been built on the lines of those at Hunslet, but the boiler-house is on the street level. There are the same number of first and second class and swimming-baths as at the other establishments, and also soap and shower baths. There are in all twenty slipper-baths, five first-class for ladies, five first-class for gentlemen, and ten second-class for gentlemen. The architects are Messrs. Hanstock and Son, of Batley; the contractors are Mr. J. T. Wright, mason and bricklayer; Messrs. Braithwaite and Co., engineers; Messrs. Mason and Son, carpenters and joiners.

**MANCHESTER.**—The Hotel Midland Grand, which the Midland Railway Company is now erecting in Manchester, will cover an area of about two acres. About three years will be required to complete the undertaking, and the probable cost is a million sterling. The style will be largely Gothic, and the stone to be used on the ground floor elevations is red and grey Aberdeen granite, with a dressing of Shap granite. The upper portion of the building will be of brick and faience. The sky-line will be broken by a series of conical towers, including one at each angle of the building. One of the features of the hotel will be a concert-hall, while the plans also show large public rooms, a winter garden, a rotunda, a roof garden, a French restaurant, business and stock rooms, Royal and private suites, and 400 bedrooms. The building is to be carried out in four sections, and the first contract has been let, at about £80,000, to Messrs. William Brown and Son, of Salford, the portion of the building now in hand being situated at the corner of Lower Mosley-street and Windmill-street. The hotel will reach a height of seven stories, including the basement. It is being erected from the designs of Mr. Charles Trubshaw, of Derby, the architect to the Midland Railway Company.

**ROATH PARK, CARDIFF.**—A new Presbyterian church is being built at the junction of Penylan-road and Marlborough-road, and facing the entrance to Roath Park. The church will con-

sist of nave, with transepts and chancel, with porches and a commodious vestibule. The internal length is 125ft., the width of nave 47ft., and across transepts 62ft. There will be an open-timber roof, in pitch-pine, the height being 42ft. The seating and all other woodworks will be in pitch-pine. The chief external feature will be the tower and spire, 150ft. high. The church is designed in the Decorated style, and is being built of Newbridge polished stone, with Bath stone dressings. The church will accommodate between 800 and 900, 700 in nave and transepts, and about 140 in a small western gallery. The architects are Messrs. Habershon, Fawcner, and Groves, Newport and Cardiff, and the contractor is Mr. James Allen, Cardiff. The cost, including organ and furnishing, will be between £9,000 and £10,000.

**YORK.**—New central premises for the Equitable Industrial Society in Railway-street and Tanner-row were formally opened on Wednesday week. The building occupies an area of 150ft. by 84ft., and is divided into eight departments. The style adopted has been a modified type of Renaissance, the architects being Messrs. Athron and Beck, of Doncaster, and the contractors Messrs. Arnold and Son, of the same town. The main entrances are of polished granite, with wrought-iron grills and collapsible gates, the floors and walls being laid with encaustic tiles. The principal fronts, which are provided with plate-glass, are faced with red pressed bricks, with red sandstone dressings, and the roofs are covered with seconds Welsh slating, with red Ruabon ridges. The cost will be about £20,000.

### COMPETITIONS.

**COTHERSTONE.**—The Startforth Rural District Council has accepted the competitive scheme of Mr. J. C. Parker, C.E., of Newcastle-on-Tyne, for the sewerage and sewage disposal of Cotherstone-in-Teesdale. The engineer recommends that the sewage be treated on bacteriological principles.

**CARNARVON COTTAGE HOSPITAL.**—Out of a large number of competitors the plans of Mr. Rowland L. Jones, architect, Carnarvon, have been selected for the new cottage hospital, and the erection of the building, on a site presented by the Lord-Lieutenant (Mr. J. E. Greaves), is to be proceeded with at once.

**GOSPORT.**—The limited competition for the Public Library and Technical Institute at Gosport has been settled. Messrs. Spalding and Cross are awarded the first premium of £100. The second place is given to Messrs. Colson, Farrow, and Nisbet, of Winchester, and the third position to Messrs. Best and Callon, of Westminster. £5,000 is the limit insisted on by the conditions. Mr. Statham was the referee appointed by the council of the R.I.B.A.

### CHIPS.

The work undertaken on the Chapter-house of Canterbury Cathedral is now complete, and the decoration of its walls is in progress by Mr. Arthur O. Hemming, under Sir Arthur Blomfield's direction. It is now proposed to replace its present zinc roof with one of lead, which was the covering originally used. The surface of part of the northern exterior of the choir has been repaired and repointed.

The plans of Mr. Munro, of Bristol, have been approved for the Chessells Mission Buildings at Bedminster, providing temporary church accommodation for 700, and utilising the space for Sunday-school work with six separate classrooms.

A 14th-century statuette of the Virgin and Child has been discovered at Llantwit Major Church. Mr. G. E. Halliday, of Cardiff, the architect who has in hand the work of reparation of the western portion of the church, brought it to light. It was found in a stairway formerly leading to a parvise over the porch, which had been built up for some hundreds of years.

The annual meeting of the National Master Plumbers' Association was held at the Victoria Hotel, Wolverhampton, on the 3rd inst. Mr. J. Beale, of Hull, presided. The Mayor having given the delegates a cordial welcome to the town, Dr. Malet and Inspector Peers delivered addresses, and advocated that apprentices to the trade should be educated in up-to-date sanitary science. The Chairman, in an address, spoke of the gross injustice to traders of the growing system of municipal trading. Mr. J. Skirrow, of Leeds, was elected president for the ensuing year, and the next meeting was fixed to be held in that city.

## TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## NOTICE.

Bound copies of Vol. LXXV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXI., XXXII., XXXIII., XXXIV., XXXIX., XL., XLV., XLVI., XLIX., LI., LII., LIV., LV., LX., LXI., LXII., LXIV., LXV., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., and LXXV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 90c. gold). To France or Belgium, £1 6s. 0d. (or 3fr. 90c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

## Correspondence.

## RESTORATION WESTMINSTER ABBEY WEST FRONT.

To the Editor of the BUILDING NEWS.

SIR,—May I be allowed to refer to the letter signed "Antiquarian Architect," in your issue of the 21st ult., and to say that the whole point of the letter vanishes when it is known that the work referred to is not done under the direction of Mr. Micklethwaite?—I am, &c.,

THACKERAY TURNER, Secretary.

Society for the Protection of Ancient Buildings, 10, Buckingham-street, Adelphi, W.C., May 5.

SIR,—If I feel strongly about this matter upon which I ventured to address you a few weeks ago, I can assure your readers, and Mr. Micklethwaite too, that I have no desire to do him any injustice. Your correspondent "F. C.," in last Friday's BUILDING NEWS, says Mr. Micklethwaite has nothing to do in any shape or form with the work of restoring the West Front now seemingly in progress. If this be so—and I accept the assurance—surely it may be asked what Mr. Micklethwaite, as architect to the Dean and Chapter, may be about, to allow work so contrary to the methods he has often professed to go on? The scaffolding is still there. If he, the surveyor to the fabric, is content to occupy that position of trust, while so-called falsifications

of its historic character are deliberately made under his very nose, and in the eyes of all men, then the beholders, and architects too, naturally conclude the work has his sanction. The late Mr. Pearson had enough to bear during his lifetime from his unsparing critics; and, as I had a letter from him a short time before his death on this same subject, I speak with knowledge when I say he had enough to endure without being held responsible for things done after he has gone. I cannot believe that Mr. Micklethwaite would in silence allow anyone to attempt a parting kick at Mr. Pearson's reputation, as I fancy "F. C." has endeavoured to do. Westminster Abbey is even more important, historically, than Peterborough Cathedral. Look at both, and see where vulgar "forgeries," so called, cry out the most with all their noisy newness.—I am, &c.,

AN ANTIQUARIAN ARCHITECT.

## CHURCH OF THE SACRED HEART, MONTMARTRE.

SIR,—The name *Amédée* as architect of the above was given in my recent article as a quotation, within inverted commas, from notes—also my own—appearing in the BUILDING NEWS for the 18th of October, 1878.

No architect's name occurs upon the lithographs, representing the building as it will be when completed, sold by outside touts and in the crowd of quaint little ecclesiastical shops that crown the height upon the north side of the structure.—I am, &c.,

Exeter, May 5, 1899.

HARRY HEMS.

## Intercommunication.

## QUESTIONS.

[12233.]—Quantities.—An architect is instructed to prepare plans, specifications, &c., for 20 houses in blocks of five each. He does so, and takes off quantities for one block of five. The lowest tender is, say, £500 for the five, or £2,000 for the 20. What commission is the architect entitled to on his quantities? The proprietors gave instructions for quantities to be taken off.—PEVERILL.

## REPLIES.

[12232.]—Damp Basement.—Have earthenware or terracotta perforated bricks inserted, or Doulton and Co.'s earthenware perforated blocks inserted in walls; have clear open space under floors of 12in. or 15in. Saturate joists with boiling carbolineum, of Peters, Baitsch, and Co., of Derby.—REGENT'S PARK.

[12233.]—Obstruction in Lead Pipe.—Most likely the result of animal, fatty, or vegetable acids. Try periodical doses of strong boiling hot solution of alkali. If possible, stop up end of pipe for a short time, allowing solution to stand in pipe and act energetically, all the better.—REGENT'S PARK.

The new isolation hospital, Aldershot, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with ornamental tiled sides and with descending smoke-flues, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Ashley-road New Congregational Church, Hale, Altrincham, was opened on the 4th inst. The building forms part of a larger scheme. The school church will have accommodation for about 350 sittings. A large lecture-room is provided, with vestry and service-room, &c. The work has been carried out by Messrs. William Lambert and Son, of Bowdon, from the designs of Messrs. William Waddington and Son, of Manchester.

A start was made last week with the preliminary work in connection with the new deep-water dock at Seaham Harbour, promoted in the first instance by the Marquis of Londonderry, and since undertaken by a company. Mr. V. D. Lake is the engineer in chief. The contractors for the building of the dock and piers are Messrs. Pearson, of Westminster, represented at Seaham by Mr. T. M. L. Walsh. The dock and piers will be formed of concrete blocks faced with granite, weighing 30 tons each. It is anticipated that the operations will take about four years to complete.

On the south side of ancient Simnel-street, Southampton, a number of slum habitations have been demolished, and on the site there is to be erected by the corporation dwellings for artisans at a cost of about £9,000. The foundation-stone of the new buildings, which are to the north of the municipal lodging-house, now in course of construction, was laid by the Mayor last week. Mr. C. J. Hair, A.R.I.B.A., is the architect, and Messrs. Dyer and Sons, of Southampton, are the contractors. There will be in the new building only 26 sets of tenements, 12 of them being of only two rooms, and the cost of building them will be close upon £350 per tenement.

## LEGAL INTELLIGENCE.

ANCIENT LIGHTS.—ASTIN v. JOHNSON.—The plaintiff in this case, heard at the Lancashire Chancery held recently at Manchester before Vice-Chancellor Hall, was Mary Astin, a widow, and she claimed an injunction against the defendant, Thomas Johnson, to restrain him from erecting or continuing the erection of certain buildings which, it was alleged, seriously infringed the plaintiff's rights of light and air. The plaintiff carries on the business of a tin-plate worker in Under-lane, Hollinwood, and certain windows on the easterly side of the premises occupied by her are ancient lights. The defendant commenced the erection of a building on ground immediately adjoining the plaintiff's premises, and only separated from them by a passage of 7ft. The plaintiff stated that if the defendant's building was allowed to continue erection it would render her property practically useless for the purpose for which she purchased it, and she would be seriously damaged thereby. The defendant denied that his building infringed the plaintiff's right or that the plaintiff had sustained any damage. Mr. James William Beaumont, architect, of Manchester, who had been appointed by the court to report on the matter, gave it as his opinion that the defendant's building interfered considerably with the plaintiff's light. His Honour granted the injunction asked for.

ARCHITECTS' CLAIM AGAINST A SCHOOL BOARD.—WOODHOUSE AND WILLOUGHBY v. MANCHESTER SCHOOL BOARD.—The hearing of this action, which was brought by a firm of Manchester architects for the recovery of £120, representing charges for measuring certain extra quantities in connection with the building of the Holland-street Board Schools, took place on Thursday and Friday in last week before Mr. Justice Bigham and a special jury. The plaintiffs were the successful competitors with plans for the schools. After the compensation more land was bought by the board, necessitating alterations in the situation of the caretaker's house and other changes. This involved revision of the plans and quantities, and while the work of erection was proceeding there were other minor alterations. The net result of these changes was that the cost of the schools was augmented by £60. The sum claimed represented 2½ per cent. commission on the extra items dealt with, but which were not included in the work done by the builders. The defence was that the original quantities were insufficient, and that alterations made from plan during the building of the schools were not sanctioned by the board. Summing up, the Judge said the dispute was of a paltry character, and ought to have been easily settled by the parties coming together. After retiring, the jury found for plaintiffs for the amount claimed. The Judge refused to certify for a special jury. It was a scandal to cause twelve business gentlemen to waste their time on such a trumpery case, and no reason why a special jury should have been asked for. Plaintiffs' counsel said his clients had offered to submit the dispute to a competent gentleman for decision, but the school board refused to consider the matter with a view to a settlement. His lordship declined to certify for a special jury, and entered judgment for plaintiffs with ordinary costs.

EXITS FROM FIRES IN FACTORIES.—At Southwark Police-court last week, John Carr, Ellis Carr, Arthur Carr, and Huntingdon Stone, trading as Peek, Frean, and Co., Bermondsey, were summoned at the instance of the London County Council for failing on January 30 and each succeeding day to March 28 to comply with a notice requiring them to provide reasonable means of escape in case of fire at the premises occupied by Messrs. Lloyd and Son, Mill-street, Dock-head, of which they were the owners. Mr. Chilvers, solicitor, appeared for the London County Council, and Mr. Morsely represented defendants. Mr. Chilvers said that between 200 and 300 persons were employed on the premises in question in making packing-cases and tins. As far back as February 17, 1896, the Council gave Messrs. Peek, Frean, and Co., notice, as owners, that they must alter the premises so as to provide adequate means of escape for the workpeople in case of fire. Defendants sent plans which the Council could not accept. In July last, however, defendants made a proposal, which the Council agreed to, but up to the present the work had not been commenced. The summons was in respect of 58 days, and defendants were liable to a penalty of £1 for each day. Mr. Morsely said the tenants of the property had instructed their architect, Mr. Elkington, to proceed with the alterations required with all possible speed. Mr. Paul Taylor imposed a penalty of £1 for the first 20 days, amounting to £20, and £5 5s. costs.

WORSHIP-STREET POLICE COURT.—Mr. Haden Corser heard a summons taken out by Mr. Henry Lovegrove, district surveyor of South Islington and Shoreditch, against the North London Railway Company. The secretary of the company gave orders for the erection of a v.c. on a piece of waste ground for the use of a tenant of some adjoining railway arches, but no notice was given to the

district surveyor, the defendants claiming exemption. Existing walls were used for three sides of the building, and the district surveyor required the front to be of brickwork. At the hearing of the case, the counsel urged that the erection so far was only a screen of wood and corrugated iron, and there being no roof, the magistrates dismissed the summons, but awarded no costs.

**RE BARTON AND SON.**—A first meeting was held on Tuesday, Mr. E. L. Hough, Official Receiver. The debtors were timber merchants, carrying on business at 57, Gracechurch-street, and their liabilities were returned at £13,118, but the Chairman reported that the amount would probably be increased to the extent of £4,000 or £5,000 by claims on pending contracts. The assets were estimated at £11,939. It was resolved that the estate should be wound up in bankruptcy, and Mr. H. W. Bayne, of Leadenhall-street, was appointed trustee, together with a committee of inspection.

#### WATER SUPPLY AND SANITARY MATTERS.

**CLAYTON-LE-MOORS.**—The urban district council have approved of a scheme prepared by Mr. Dodgeon, surveyor to the council, for surface-water drainage for a portion of the district, and have decided to apply to the Local Government Board for sanction to borrow the sum of £475 to carry out the work.

**NORTHAM WATERWORKS.**—A reservoir is being constructed on Melbury Moor, eight miles from Bideford, to supply Northam with water. The works are being carried out by Messrs. Dart and Pollard, contractors, of Paignton, under the directions of Mr. Baldwin Latham, C.E., engineer to the Northam Urban District Council. The operations have been in progress about five months, during which time huts for the men have been erected, and stabling, sheds, workshops, &c. The wall of the dam will be supported by earthwork on either side, 200ft. thick at the base, tapering off to 10ft. at the top. The reservoir when full will contain over 33,000,000 gallons of water. This, after passing through filter-beds, will be taken by means of a 6in. pipe to a second reservoir to be built at Northam, eight miles distant. There it will be distributed to Appledore, Westward-Ho, and all outlying parts of Northam town, 18½ miles of pipe being required for the purpose. The resident engineer is Mr. W. E. Thornton, Nilgala, Bideford. Mr. W. H. C. Pollard is the resident representative of the contractors, and Mr. W. Squires is foreman of works. Mr. J. E. Parnell has charge of the engineering department. The contractors expect to complete the works in two years, the contract price being £26,000.

**PORTISHEAD.**—A system of sewerage has just been completed, and house connections are being made. The sewage, without treatment of any kind, is discharged into the Severn at a point about a mile from the shore, valves being provided to keep the sea water out of the sewers. The outfall sewer is straight, and 1,896ft. in length, being constructed of 15in. cast iron-pipes with spigot, socket, and flange joints. The total length of sewers on the high and low levels is, approximately, eight miles. Those on the high level consists of 6in. to 8in. pipes, the depth below ground level varying from 4ft. 3in. to 38ft. 4in., the deeper sewers being constructed in tunnel. For the low level the sewers are chiefly 6in. and 8in. stoneware pipes, the main sewer through the town being constructed of Parker and Hassall's double-lined pipes. Ventilation is on the column and pipe system. Messrs. Doulton and Co. supplied most of the ordinary pipes. The works have been carried out at a cost of £15,000, under the direction of Mr. T. J. Moss Flower, C.E., F.G.S., 25, Victoria-street, S.W., and Scottish Buildings, Bristol. Messrs. J. and T. Binns, of Horwich, were the contractors, and Mr. F. W. Trimm was the clerk of works.

#### CHIPS.

The town council of Tunbridge Wells have decided to increase the salary of the surveyor from £250 to a maximum of £350, by £20 annual increments.

The corporation of Liverpool had another long discussion on the maintenance or demolition of St. George's tower and spire at their last meeting, and eventually resolved to leave the final decision in the hands of Dr. Ryle, the Bishop.

The Select Committee of the House of Commons has sanctioned the scheme of the Great Western and Great Central Railway Companies for providing a new line from the Great Central into London without running over the Metropolitan Railway, under an existing agreement.

The scheme for enlarging the interesting parish church of Preston, near Brighton, in accordance with plans prepared by Sir Arthur W. Blomfield, A.R.A., has been abandoned, and it has been decided to build a district church on a fresh site.

### Our Office Table.

STUNG, apparently, by the criticisms passed upon his scheme for decorating St. Paul's, so far as it is yet revealed in the eastern portions of that cathedral, Sir W. B. Richmond has penned a three-column letter to the *Times*, of which the keynote is that "I am the responsible person in this matter." He desires to be judged not by his contemporaries, but by posterity, which is awkward for the present generation, especially as Sir William considers "that no present-day expression of opinions will indirectly influence the final decision upon my work which must be arrived at a long time hence." Sir William tells us he invites criticism; but the remarks of architects are a breach of that modesty which is becoming to "builders, as they should properly be called." He argues that nearly all the great buildings of the world have been decorated and often covered with coloured ornament. "St. Paul's, which, as Wren left it, was cold and austere, ought to be treated in the same way, and by myself"—a delightful illustration of that "modesty" which, however becoming in builders, lends an additional grace to eminent artists and amateur architects. Another gem from the same epistle has indeed quite a flavour of its own of modesty: "Much as I may value the opinion held by my friends and colleagues, my president Sir Edward Poynter, and my other president Mr. Aitchison, at the risk of seeming to be presumptuous, I confess to hold my own opinion in yet higher esteem." Job didn't know everything, when he exclaimed, "O that mine enemy would write a book!" Nowadays, if one's adversary can be indulged with three columns of rope in the *Times*, he is pretty nearly certain to hang himself!

The first of the series of lectures to be given in connection with the periodical examinations of the Carpenters' Company was delivered by Mr. F. R. Farrow, F.R.I.B.A., at Carpenters' Hall, London Wall, on Thursday evening in last week, the subject being "Strength and Strains in Wood." The lecturer explained the nature of compression, tension, torsion, and other stresses or strains to which timber is subject, and then went on to illustrate from the structure of a roof the way in which those stresses came upon its different parts. Figures relating to the factors of safety in strains were then given, and some of the static problems of construction were dealt with. Mr. Farrow illustrated his address by take-to-pieces models, diagrams, photographs, and specimens of materials.

At the last meeting of the Brighton Corporation, the sanitary committee presented tenders for the erection of 28 five-roomed artisans' houses in St. Helen's-road, Elm-grove, and recommended the acceptance of the tender of Messrs. Sattin and Evershed to do the work for £7,424. They pointed out that at this price 8s. 6d. must be charged for rent, and recommended that, in order to let for 7s. 3d. per week, application should be made for an extension of the period of repayment of the loan sanctioned by the Local Government Board. The chairman of the committee explained that a year ago since they invited the local architects and surveyors to prepare competitive plans of dwellings to be let at 5s. 6d. a week. "Sanitas" won the premium of £75 for preparing the best plans, and he estimated the cost of the houses at £165 6s. 9d. apiece, the borough surveyor putting them at £204 10s. Tenders were invited, and they were disappointed in only getting three, the lowest of which was £7,424. If they built the houses at that cost, the lowest they could let them at was 8s. 6d. a week, and this was due to the fact that materials had advanced in price by 20 per cent. If they could borrow the money for 40 years they could let the houses at something like 7s. a week, and at that rental the sanitary committee were very doubtful whether the houses would so readily let as they had anticipated. A long discussion ensued, the members being obviously disappointed to find that the recent advances in wages and reduction in working hours had so increased the cost of building operations, and in the end the report was referred back to the committee.

The annual report of the curators of the Sheldonian Theatre, which was presented to the Senate of Oxford University on Tuesday, gives, on the authority of Professor A. H. Church, a serious account of the condition of the ceiling paintings in the theatre. These are on canvas, and were executed by Robert Streater about 1669,

in which year Pepys saw them approaching completion. The report of the curators gives an interesting history both of the paintings and of the roof itself. The paintings appear to have been already restored in 1762, in 1802, and in 1826. In 1802 Wren's roof, reported as "in a state of decay," was entirely removed and a new roof, externally, at any rate, "extremely dissimilar," was substituted for it. Among other alterations, the series of oval dormer windows which surround the original roof, and which appear in Loggan's print, as well as in the frontispieces of books formerly issued by the University Press (the work of which till 1714 was carried on in the space above the painted ceiling), were entirely removed. The curators observe that the paintings of the roof formed part of Wren's original design, and were certainly *in situ* when the theatre was opened on July 9, 1669. They hope to be able to prevent the progress of any further injury, but it will be a difficult and expensive process.

COMPRESSED air for cleaning purposes is being used in some of the taller office buildings in New York City. Many of the buildings have their elevator walls partially hidden behind more or less decorative grill work. It is frequently of bronze, and of such design that the dust of a week detracts much from its appearance. To remove the dust, which always lodges in the smallest cracks, a jet of compressed air is directed upon it. In the Dun Building in New York, such a plant was installed by Mr. John W. Ferguson, of New York, and consists essentially of a system of pipe-lines throughout the buildings with outlets wherever desirable. Short flexible-hose connections are attached to these, and a nozzle at the other end of the hose may be carried about at will.

We understand that the Eiffel Tower is undergoing a complete renovation in preparation for the forthcoming exhibition. It has been decided to paint the entire structure with an enamel, and for which five shades have been chosen. The dome and summit are to be of a fine lemon chrome, and the shades will graduate to the pedestal, which will be a rich dark orange. The product, chosen from among thirty different manufactures, has been "Le peinture Laque Chine Email" of the Société Anonyme des Etablissements Georges Hartog, of Paris, a company which has lately been formed by the amalgamation of Messrs. Georges Hartog and Co., and the Paris Branch of Messrs. Robt. Ingham, Clark, and Co., Ltd., of London, Hamburg, New York, and Chicago. It may be interesting to note that for the two coats which are to be applied upon the Tower, nearly fifty tons of enamel will be employed.

The report of the Boston (Mass.) Fire Commissioner reveals the influence of new methods of construction on fire-losses. The "defective flue," which was once almost the main source of fires, shows a decided loss of harmful power, the number attributed to this cause in 1898 having been only 11 out of a total of 1,500 fires. The local regulations, which have for fifteen years past required flues from boilers, furnaces, and ranges to have either 8in. walls or fireclay linings, have contributed greatly to this change. Sixty-five fires were caused by electric wires, and 67 by lamp explosions. Matches caused 215 fires, and spontaneous combustion and explosion or ignition of chemicals caused 132. Out of the whole number of fires only 39 extended to other buildings.

#### MEETINGS FOR THE ENSUING WEEK.

- SATURDAY (TO-MORROW).**—St. Paul's Ecclesiastical Society. Visit to Lincoln's Inn Chapel. 3 p.m.  
Northern Architectural Association. Visit to South Shields.  
**MONDAY.**—Surveyors' Institution. "Land Purchase in Ireland," by R. M. D. Saunders, F.S.I. 8 p.m.  
Royal Institute of British Architects. "The Architectural Element in Engineering Work," by H. H. Statham. 8 p.m.  
**TUESDAY.**—Society of Arts. "The Artistic Treatment of Picture Frames," by I. Hunter Donaldson. 8 p.m.  
**WEDNESDAY.**—Society of Arts. "The Law of Trade Marks," by J. E. Evans Jackson. 8 p.m.  
**THURSDAY.**—Carpenters' Hall Free Lectures. "Timber Roofs," by Professor Banister Fletcher, F.R.I.B.A. 8 p.m.

At the last meeting of the Salford Town Council it was decided to lay a new water-main from Gorton Reservoir to the borough, at a cost of £25,000.

## LIST OF COMPETITIONS OPEN.

Arbroath—Public Shambles .....	£7, £5, and £3 .....	W. F. Macintosh, Clerk to Commissioners, Arbroath .....	May 16
Leeds—Market Hall and Shops, Kirkgate Market .....	£150, £100, £50 .....	The City Engineer, Municipal Buildings, Leeds .....	June 1

# THE BUILDING NEWS

## AND ENGINEERING JOURNAL.

VOL. LXXVI.—No. 2315.

FRIDAY, MAY 19, 1899.

### THE DISPUTE IN THE BUILDING TRADE.

A SETTLEMENT ARRIVED AT.

WE have said comparatively little about the points at issue in the recent lamentable series of disputes, because we have felt sure all along that the good sense of both sides would avoid the threatened disastrous lock-out or strike, about which some of our contemporaries have been writing so glibly during the past week or two.

We believe that, at the moment of going to press, an arrangement has been arrived at between the representative organisations of the masters on the one side, and the men on the other, which will, if formally ratified, terminate the struggle within the next few days, and afford a lasting basis of future concord. We have little doubt ourselves that this ratification will be accomplished.

We believe that the questions of apprenticeship and demarcation are to form the subject of a special arrangement by a special joint committee. With regard to the matter of alleged boycotting and blacklisting, the men give an undertaking which guarantees the avoidance of these practices in every case where the employer abides by the mutually-agreed upon trade rules. We also believe that a satisfactory formula has been arranged which covers strikes against non-unionist labour.

If sectional bitterness should by any unhappy chance upset the agreement practically arrived at, the responsibility on either side will be a very heavy one. We cannot believe in its possibility. We feel sure that the good sense of both sides, which has facilitated an intervention as honourable as it has been effectual, will prove equal to the task of adjusting all details of a settlement which, in our opinion, is a statesmanlike and generous one.

### ESTIMATES.—VI.

BRICKWORK, TILE-PAVING, ETC.

THE application of "constants of labour" to the determination of values in the trades of building is worth more attention than is usually bestowed. A "constant" is really a number or a fraction which is used to fix or preserve the results of observation as to any particular thing—in this case, labour; in fact, a constant represents the average time of executing each kind of work. Many French writers on construction have employed them in all the trades, and in numerous works on building and construction, as in Dobson's "Guide to Measuring," in Hurst's "Handbook," &c., a series of constants for the trades are given. A constant represents, in days and decimal parts of a day, the time which it takes to execute a certain unit of work like a yard or a foot. By multiplying the amount of the workman's wages for 10 hours by the given constant we find the cost of the unit of a yard or foot. If, for example, a bricklayer gets 9d. per hour, which is the wage paid in London, and he works 10 hours, the amount of his wages will be 95d., or 7s. 11d. Let us apply the constant for cutting and bonding new in old work, which is .022 per foot super. Multiplying 95d. by .022 we get 2.090, or, say, 2d. per foot super. For rough cutting to birdsmouth the constant is given as .008 day of a bricklayer. Thus  $95 \times .008 = .760 = \frac{3}{4}$ d. per foot run.

The cost of labour can only be determined by a close observation of the work done by each workman. One man will do a fair day's work, another only half the quantity. In London the wages per hour are given as under, and upon these we base our labour items:—

	£	s.	d.
Excavator .....	0	0	6½
Labourer .....	0	0	6½
Bricklayer .....	0	0	9½
Mason .....	0	0	9½
Fixer .....	0	0	10
Carpenter .....	0	0	9½
Joiner .....	0	0	9½

The following is the rate of wages issued by the London County Council. They are also those of the trade-unions in the London district, and comprised within a radius of 12 miles from Charing Cross:—

	Per hour.	(a)	(b)	(c)
Carpenters .....	9½d.			
Joiners .....	9½			
Bricklayers .....	9½			
Bricklayers (cutting and setting gauged work) .....	10½			
Plasterers .....	9½	50	47	44½
Masons .....	9½			
Masons (fixing) .....	10½			
Painters and glaziers .....	8½			
Smiths, fitters, &c. ....	9 to 10			
Labourers .....	6½			
Plumbers .....	11			

Columns a, b, c represent the hours of labour per week; a are the summer hours, b and c are the 14 winter weeks after the first Monday in November; b giving the three weeks at beginning and three weeks at end of that period, and c the eight middle weeks.

Plumbers work 47 hours in summer, 44½ hours during the three weeks at beginning and end of winter, and 42 hours during the eight middle weeks.

With these preliminary remarks we resume our bill.

140ft. super. Filling-in to hollow walls with White's "Hygeian Rock" composition, 2in. thick, as vertical dampcourse.

This is priced at 1s. 4d. per foot super., but it is desirable to obtain a quotation for special requirements.

543ft. super. Dampcourse of Callender's Pure Bitumen, ½in. thick.

Price at 3d. per foot super.

Callender's Pure Bitumen Dampcourse is sold in pieces 24ft. long, of the following widths and pieces:—5in. wide 2s. 3d., 10in. wide 4s., 12in. wide 4s. 10d., 15in. 5s. 9d., 19in. wide 7s., 24in. wide 9s. 3d., 27in. wide 11s. net cash.

Taking a 14in. wall and using the 15in. wide piece at 5s. 9d. the piece, the cost for the material works out at a trifle over 2d. per foot super. To this ½ may be added for labour. It is better to obtain estimates for this and other special preparations, as the cost will largely depend on quantity.

30ft. run rough-cut birdsmouth.

2d. is a fair price for this item.

55ft. run rough, cut chamfer to inside arches and jambs.

This may be put at 1½d. per foot run.

20ft. run rough-cut splay 5in. wide.

Put this the same.

35ft. run. Cutting chase for pipe 4½in. by 4½in. Say 4d. per foot run.

No. 80. Frames bedded in lime and hair, reveals screeded and pointed.

The cost may be calculated as follows:—

	£	s.	d.
Lime and hair .....	0	0	2
Plasterer and labourer half an hour, say .....	0	0	8
Fixing rough deal screeds, say .....	0	0	4
	0	1	2
Profit .....	0	0	1½
Each .....	0	1	3½

Of course the value depends on the size of

frame, and a bill should give the dimensions of frame.

605ft. super. Facings in picked stocks finished with neat struck joint.

This is sometimes put at 2d. per foot.

The extra value only on facings may be obtained by deducting the difference per thousand between stocks and the facing bricks, and divide remainder by 10 to find price in pence per foot.

The number of facing bricks to each rod may be put at 1,000.

Picked stocks are usually selected.

A usual contract price in the Metropolis is 1d. per superficial foot, including pointing. The best malm facing Laxton prices at 5½d. per foot, labour and materials, and dark red Bracknell at 5d. per foot. Best white Suffolks are 4½d., and red Fareham bricks at 5½d. The number of facing bricks per superficial foot is about seven.

230ft. super. Extra facing with Lawrence's (Bracknell) best red facing bricks, including raking out joints and pointing with a neat bevel joint in fine mortar.

Obtain price per thousand of bricks in field, add carriage, loading and unloading and stacking, and deduct price of ordinary bricks.

	£	s.	d.
Price of bricks delivered on works, say ..	3	0	0
Deduct price of ordinary bricks, say .....	1	14	0
	1	6	0

Say the extra cost of seven bricks at this rate per thousand is 2½d. per foot, add raking out and pointing, say 2d., will give 4½d. per foot super.

The following prices are quoted for Thos. Lawrence and Son's Bracknell facing bricks:

	£	s.	d.
No. 4, Orange red, pressed, per 1,000 ...	3	7	1
No. 5, Cherry red " " " " " " " "	3	10	1
No. 6, Dark red " " " " " " " "	3	12	7
No. 12, Orange red " " " " " " " "	2	14	3

These prices are delivered at Nine Elms Station, then to these prices add unloading and loading, cartage, say 3s. 6d. within two miles.

Other well-known bricks are used for facings, such as the Fareham red, the Loughborough white pressed, Kent gault bricks pressed, and best malms, Red Ruabon pressed. Here are a few quoted prices:—

	£	s.	d.
Red Ruabon pressed facing bricks, per 1,000 .....	2	15	6
Blue ditto, per 1,000 .....	2	15	0
Buff ditto, per 1,000 .....	3	0	0

These prices are in trucks at works.

Ornamental bricks are supplied by Mr. James Brown, of Essex Wharf, Whitechapel, whose London prime cost prices are:—

Ordinary patterns of moulded strings, 3in. high headers, and stretchers:—

11s. 6d. per 100; angles square, 3d. each.

Moulded plinths, strings, labels, &c., 4½in. high, set on edge (4 to a foot):—

13s. 6d. per 100; angles 6in. square, 6d. each.

Moulded courses 5½in. high:—

15s. per 100; angles, 1s. each.

56ft. run. Extra on brickwork for labour in moulded brick and facing to one course of moulded brick as string, oversailing, raking out, and pointing to match facing:—

	£	s.	d.
Moulded bricks at £4 10s. per thousand	4	10	0
Railway rates, cartage, &c. ....	0	15	0
	5	5	0
Deduct 1,000 stocks at .....	1	14	0
	3	11	0

Say there are three moulded bricks to the foot run of string at the above price per 1,000, extra cost of these would be

Add labour, raking out, and pointing 6in. girt = ½ft. at 1½ per foot super. ...

0 0 0½

0 0 3½

65ft. run. Extra in brickwork in moulded brick course, raking out and pointing.

Suppose this item is to be of James Brown's moulded bricks  $4\frac{1}{2}$ in. high, set on edge:—

Price at London depot 13s. 6d. per 100, £ s. d.	
allowing four bricks to a foot, $\frac{100}{4}$	
= 25ft. run. and 25ft. run at 13s. 6d.	
= 1d. per foot	0 0 7
Railway cartage, &c.	0 0 1 $\frac{1}{2}$
Add labour, raking out, pointing, 9in. girt = $\frac{1}{2}$ ft. at $\frac{1}{4}$ d. per foot super.	0 0 1 $\frac{1}{2}$
Deduct stocks, say	0 0 2
	0 0 7 $\frac{1}{2}$

56ft. super. Extra on facings, rubbed and gauged segmental arches in Lawrence's No. 10 red rubbers, raked out, and pointed in putty.

In pricing this item we have to obtain the price of bricks per thousand, adding expenses of railway rates, loading, unloading, cartage, &c.; then find cost of rubbers necessary to do 1ft. superficial of gauged arches,

and deduct from this the cost of ordinary facing, and add labour for rubbing, setting, &c.

Say, bricks per thousand, including railway rates, 2 $\frac{1}{2}$ tons, &c.	£ s. d.
Cartage to works within two miles	4 15 0
Unloading and stacking	0 2 6
	0 1 0
	4 18 6
Ten bricks to the foot super. is generally allowed for gauged arches, including waste, and the cost of same is at the above rate, say	£ s. d.
Deduct cost of facings	0 1 0
	0 0 2 $\frac{1}{2}$
Add for labour, rubbing, and setting	0 0 9 $\frac{1}{2}$
	0 1 2
Say cost per foot super. 2s.	0 1 11 $\frac{1}{2}$
Add profit	0 0 2
	0 2 1 $\frac{1}{2}$

42ft. super. Extra on facings, segmental arches of best malms, gauged and set in putty.

This may be put at the same price. One price-book prices it as high as 2s. 9d., all materials.

Last week we illustrated a section of a hollow wall, showing a cavity of 2 $\frac{1}{2}$ in., and an inner wall of 9in., and an outer wall of 4 $\frac{1}{2}$ in., above the frame of window opening, intended to show how the window frame is protected from moisture. A piece of 4lb. lead of the whole width of frame, and a few

inches beyond on each side, is tucked into a joint of the brickwork of the outer and inner thickness a course or two above the frame, and bent to form a gutter as shown. The gutter is dressed to give a fall from centre each way, so that the moisture which comes through outer wall is thrown off into the hollow beyond opening.

The previous section showed a similar cavity wall, tied together with galvanised iron ties (four to each superficial yard), and the manner the cavity is formed below the plinth.

This week we show some ordinary kinds of moulded bricks. These bricks are  $3\frac{1}{2}$ in. thick. The price of Ruabon bricks is £5 10s. per thousand. The sections are suitable for cornice joints, sills, and plinths; *e* is a good plinth, *b* a string cornice or sill brick; *a c d* are also good cornice or sill mouldings.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fortnightly meeting of this Institute was held on Monday evening, the President, Professor George Aitchison, R.A., in the chair.

##### THE ARCHITECTURAL ELEMENT IN ENGINEERING WORK.

A paper on this subject, or rather on that phase relating to bridges, was read by Mr. H. HEATHCOTE STATHAM, and was illustrated by lantern slides. The author discussed the respective spheres of the professions of architecture and engineering, and observed that the purely utilitarian structures of the engineer had an interest of their own, if of a lower order than that of architectural structures, and he held that those who persistently decried engineering work gave evidence not so much of superior taste as of one-sided education. The appearance of a railway girder bridge was redeemed by its obvious suitability to its purpose, and it was absurd to blame engineers for erecting steel bridges and thus spoiling the scenery when their duty to their employers practically left them no choice. The author, who apologised for not having completed his paper, gave a running commentary on a series of lantern slides of bridges, beginning with a crude Canadian suspension structure of branches, and passing on to elaborate Japanese works of steep gradients, and then to trestle viaducts in the United States and Cornwall, and on to the consideration of stone and steel structures. Most bridges, he pointed out, were characterised by simplicity. But within the last 25 years the minds of engineers had become possessed with the idea of producing handsome structures, for which their training had not fitted them, and this desire on their part had resulted in things of which there was real reason to complain. Hammersmith Bridge was a terrible instance of lack of sense of scale. The Tower Bridge again illustrated a different vice—a total want of simplicity—and a desire to make the structure look what it was not, and here an architect whose name was concealed had been called in to ornament the superfluous granite boxing of the piers. The proposed new Vauxhall Bridge was an example of trying to make a very ornamental thing instead of being content with a simple one. It was said to be an imitation of a bridge at Coulouvrière, near Geneva. This latter from a distance was picturesque; but its detail was not good, and no architect would have designed it. He regretted the engineer to the Bridges Committee had ever seen it. He then criticised the design of Vauxhall Bridge in detail, concluding with the observation that the whole thing was a jumbled collection of details which might be got out of books put together by someone who did not understand the language of architectural design. Why should not an architect design a bridge, assisted by an engineer?

In the discussion which followed the Earl of WEMYSS urged at great length the importance and advantages of making models of all new structures with their surroundings, which would, he believed, enable members of the Houses of Parliament to understand the merits and demerits of proposed buildings and engineering works, and, if provided, would have prevented the adoption of the recent designs for the War and Government Buildings—a suggestion good-naturedly applauded by Mr. J. M. Brydon, who was seated just behind the octogenarian

lord. He proceeded to twit the President and Council of the Institute with having done nothing to protest against the work in progress at St. Paul's Cathedral, and with having been inactive as to the new buildings in Whitehall.

Mr. A. T. WALMSLEY thought architects had no more desire to undertake great engineering works than to prepare their own quantities. He held that engineers should be made responsible for the stability of these immense engineering undertakings, and architects might, perhaps, be called in to advise as to the arrangement of parts and details.

Mr. HENRY LOVEGROVE reminded the lecturer that the late Sir Horace Jones designed the details of the Tower Bridge, and after his death the work was continued by Mr. D. T. Stevenson. To which Mr. STATHAM replied that Sir Horace Jones made a design, but this was quite different to the executed work.

Mr. BERESFORD PITE remarked that if Sir Alexander Binnie took up the same position with regard to Vauxhall Bridge as Sir William Richmond had done at St. Paul's, they would be in an *impasse*. Architects had no quarrel with the construction of Vauxhall Bridge, although they might object to casing concrete with granite.

Professor KERR said the address had not been so academical as he had expected, but it was very suggestive. The lantern views shown had been delusive, as they were taken from points of view to suit artists, and not architects. The point was, why should not the construction of engineers be beautified? If the public did not, as Lord Wemyss seemed to think, understand drawings, by all means let models be constructed of all new works.

Mr. W. WOODWARD observed that at an early stage of the correspondence between the Institute and the London County Council as to Vauxhall Bridge, Messrs. Waterhouse and Mountford wrote to Sir A. Binnie expressing their "entire satisfaction" with the design, subject to a few corrections to be made by Sir Alexander. Did not this strong expression of approval close the mouths of the Institute with regard to the buildings? The lecturer had criticised the details of that bridge, and especially a column on each pier carrying nothing; but, unfortunately, an hotel could be seen in High-street, Kensington, designed by a distinguished architect, where there were columns carrying nothing, and dozens of examples by other well-known members of the Institute could be seen in various parts of London. Again, Mr. Statham had objected to the casing of concrete by cement; but he must know that all the Italian churches were merely veneered with marble, and, further, it was difficult to understand, on structural grounds, why concrete, which admittedly had structural advantages, should not be encased in a more durable material. The lamp standards had also been criticised; but instead of regarding the design as one of unmitigated ugliness, he believed most of those in that room were impressed with the dignity and general excellence of the design of that bridge. ("Oh, oh," and laughter.) Mr. Statham would have been well advised if he had confined his criticism to general matters; when they came to examine the wonderful design for the improvement of the bridge, prepared by the joint effort of Messrs. Statham and Mountford, they must condemn the drawing for its "unmitigated ugliness," worthy of an engineer; and he, for one, could see no improvement on the accepted design. The narrowness of the piers was, they knew, not the fault of the engineer, but was due to the Thames Conservancy Board.

Mr. E. W. HUDSON asked Mr. Statham's opinion of Page's bridge at Westminster, the lines of which he thought very graceful.

Mr. E. W. MOUNTFORD contended that Sir A. Binnie had been successful in reproducing some of the objectionable features of the bridge at Geneva without any corresponding advantages. The bad appearance of Vauxhall Bridge was certainly partly due to the smallness of the piers, owing to the refusal of the Thames Conservancy Board to permit wider ones to be put down. The Institute Committee suggested that these should be widened by some 5ft. or 6ft., for appearance sake, but were informed that it would be quite impracticable. Still, the opposition of the Institute had not been in vain. Mr. Statham had not, as Mr. Woodward supposed, objected to the casing of the concrete; it was necessary to cover it in, and it had been suggested that Sir W. B. Richmond might turn his attention from St. Paul's and incase the bridge with mosaic. The letter to Sir A. Binnie, expressing general approval of the

general outlines of the design, was intended to be private, and was written with a purpose.

Mr. W. D. CAROE having pointed out that the difficulty was to get the public and the engineering profession to understand what was ornament, Mr. STATHAM replied remarking that Westminster Bridge looked well, but lost its interest when one knew that the graceful lines of the bridge did not correspond with those of the ironwork which really carried the load. He had not objected to the casing of concrete with granite.

Mr. WOODWARD asked if Messrs. Mountford's and Stathan's design for Vauxhall Bridge would be published in the *Institute Journal*.

Mr. STATHAM replied No, he did not prepare designs for Mr. Woodward to criticise, and wrote his paper for quite a different class of person.

The PRESIDENT announced that a special meeting would be held on May 29 to rescind for the time being by-laws 3 and 11, to allow of the election of G. F. Bodley, A.R.A., as a Fellow.

#### THE ARCHITECTURAL ASSOCIATION.

THE closing ordinary meeting for the present session of the Architectural Association, was held on Friday evening at 9, Conduit-street, W., the President, Mr. G. H. Fellowes Pryne, F.R.I.B.A., in the chair. Mr. G. B. Carvill, Hon. Sec., proposed a vote of thanks to Messrs. G. H. Fellowes Pryne and F. A. Walters for conducting visits over new churches at Ealing, on April 29th, and to Mr. H. Greville Montgomery for arranging a visit to the Building Trades Exhibition on May 6th. Mr. E. Howley Sim, Hon. Sec., announced that the Annual Dinner would be held on Wednesday, May 31st, at the Holborn Restaurant. The following gentlemen were elected as members: W. H. Baines, H. McGowan Bowes, J. Faraday, G. H. Lovegrove, G. H. Peache, W. J. Windrum, J. Saunders, and N. D. Sheffield. The President called attention to the fact that the visit arranged for Saturday, June 3rd, to Hatfield Hall could not be held, and that the members would see in lieu thereof Cobham Hall, Kent.

#### ASPECT AND SOIL IN RELATION TO THE DWELLING-HOUSE.

A paper on this subject was read by Dr. G. V. POORE, who pointed out that the conditions under which dwelling-houses are built have been revolutionised by steam machinery. Modern facilities as regards water supply and sewerage have made curtilage unnecessary, and have enabled us to build towers of flats which, from the sanitarian's point of view, are most undesirable. While all recognise that overcrowding is the greatest of social evils, both as to morals or health, the lecturer pointed out that public opinion is at present mainly in favour of overcrowding in cities, and, further, that overcrowding is encouraged both directly and indirectly by modern municipalism and the by-laws which regulate building operations. The speculative builder considers the question of cost and cost only, and until the public recognise that aspect has a real money value and is worth paying for, there is no likelihood that the question of aspect will trouble the mind of the builder.

#### URBANISING IN PRACTICE.

The engineer and the surveyor have too much the "whip hand" of the architect, and by the time the building estate has been laid out the whole question of aspect has been practically settled, and the architect has really no choice in the matter. The author described in racy terms the "development" (so-called) and the wholesale urbanising of a rural spot, with all the evils attendant thereon, and showed that where a recreation ground was rescued from the speculating builders' clutches, the houses which surrounded it did not look upon this green oasis, but were directed to the main roads, while a dismal array of privies and washhouses were turned towards the open space.

#### ASPECT.

Since the best aspect for the chief rooms of a house is one looking to the south-east, it is obvious that if the main roads of a building estate run from south-west to north-east, the houses flanking such roads would have one side turned to the south-east. On the north side of the road the fronts would face the south-east, and on the south side the backs would face the south-east, unless the local council permitted, and the builder were willing, to allow the backs of the houses on

the southern side of the road to be turned to the street. Speaking as a doctor, he urged that it would be advisable to turn the backs to the street, if by so doing a good aspect can be obtained for the chief rooms. By adopting this plan we have the additional advantage of bringing the culinary and sanitary arrangements close to the street, and thereby greatly simplifying the sewerage arrangements. Whether houses with their backs to the street would meet with the approval of "the masses," he could not say. If it were considered essential that the chief rooms of a house should face the south-east, there could be no difficulty in attaining this end (except in streets running from north-west to south-east), provided the houses were placed obliquely to the street line and were built *en echelon*—a mode of building which tends to secure privacy, although it probably adds to the expense of building and the difficulties of plotting out the estate. Is it necessary that all the roads on a building estate should be absolutely straight and at right angles to each other? Is it quite impossible to rest the eye and give some variety by an occasional curve?

#### DOCTOR SUNLIGHT.

The question of aspect is very much a question of sunlight, and the latter has great influence on health. The Italians have a proverb which says that the doctor comes to those places which the sun does not visit, and it is certain that there is most tuberculosis in places which are overcrowded, and to which the sun finds access with difficulty. Among children under five there is more tubercular disease in London than in any other county, and probably for the reason that the number of persons on a given area is greater in London than in any other county. It is, indeed, a remarkable fact that in only two of the registration districts in London (Lewisham and Hampstead) is the death-rate of children from tuberculosis less than it is in England as a whole. In all the other districts the death-rate from the tubercular diseases is much higher than in the country at large. This prevalence of tuberculosis is due to overcrowding of houses on the land and overcrowding of people in the houses, to the dirt-laden air and the darkness and the gloom. In London it is almost idle to talk of aspect. If aspect is mainly a question of sunlight, then in London it is not only necessary to have your house facing towards the sun, but also to make sure that no screen in the shape of a tower of flats intervene between it and the sun. To have your house facing the sun, and with its chief living-rooms well exposed to it, means a considerable saving of fuel and gas. If a dwelling be detached and isolated it is generally possible to give the chief rooms any aspect which may be desired. It is common to find, however, that detached villas have their fronts parallel to the road, even though this position should entail a north-east aspect.

#### A PLEA FOR THE ISOLATED DWELLING.

On the general grounds that overcrowding is to be lessened by every means in our power, sanitary authorities should encourage the erection of detached and isolated dwellings. The most important part about a "home" is not the house but the garden round it. The children of a country labourer, born in the commonest and cheapest erection of wood or mud and thatch, standing in its rood of potato-ground, have a much better chance of growing up healthy in body and mind than those who have been born under the fostering care of Urban District Councils in houses with concrete foundations, damp-proof walls, patent water-closets and traps, sewer-pipes, and rain-water pipes; with an expensive paving in front, and a tiny concreted yard behind, which is practically an air-well with putrefaction traps in its floor. This last class of dwelling, the outcome of by-laws which seem to be designed for the purpose of rapidly urbanising rural places, is very expensive, and the artisan finds that he has to pay, relatively, an enormous part of his earnings in rent and rates, and that his children have no private playground. The stringent building by-laws which are now in force in many places are admittedly necessary in crowded centres of population; and if they were still more strict on the question of height of houses, and the relation to be enforced between the cubic contents of the building and its surroundings, no one would object. On the other hand, these by-laws very much augment the cost of building, and thus it is becoming increasingly difficult to get an adequate return for houses erected for the wage-earning class. So much is this the case that it seems not

unlikely that municipalities will be called upon to provide dwellings and run them at the expense of the ratepayers as a whole. Many rural municipalities have adopted these by-laws, and appear to enforce them very often to the detriment rather than the advantage of the locality. The builder of an isolated dwelling ought, the lecturer contended, to be allowed to escape from these harassing by-laws, and ought to be permitted greater freedom in the choice of building materials than the speculator who is trying his hardest to put the maximum population on the minimum legal area. In relation to fire and infectious disease, the surest preventive measure is the isolation of the dwelling. If the dwelling be separated from the boundaries of other premises and the public thoroughfare by a distance equal to its height, it ought to be allowed to escape from the by-laws. The insurance offices will know how to enforce an adequate security against fire.

#### WHY NOT WOODEN COTTAGES?

Mr. Till, of Eynsford, in Kent, recently erected two timber cottages in the country on either side of a road. One of these cottages was condemned because it happened to be within the boundary of a council which had adopted model by-laws. The only valid reason for such condemnation was the danger of fire. But it is evident that the danger of loss of life from fire is very slight in an isolated cottage with the bedroom windows, at most, some 10ft. above the ground. On the other hand, the danger to loss of property is indicated by the fact that the insurance offices charge 2s. 6d. per cent. instead of 1s. 6d. If, however, a model by-law cottage costs £250, while a wooden cottage equally large and wholesome costs £150, it is evident that the cost of insurance is equal in the two cases. The rent of the first at 5 per cent. would be £12 10s., and the rent of the second £7 10s. By living in a wooden cottage, allowing for rates at 4s. in the £, the working-man would save £6 a year, or nearly 2s. 4d. a week. But the isolated cottage must be under control as regards cesspools or any underground sanitary abominations, which may be an unseen danger to the neighbours; but on the grounds of the health and safety of the public, builders of isolated dwellings ought not to be harassed by by-laws.

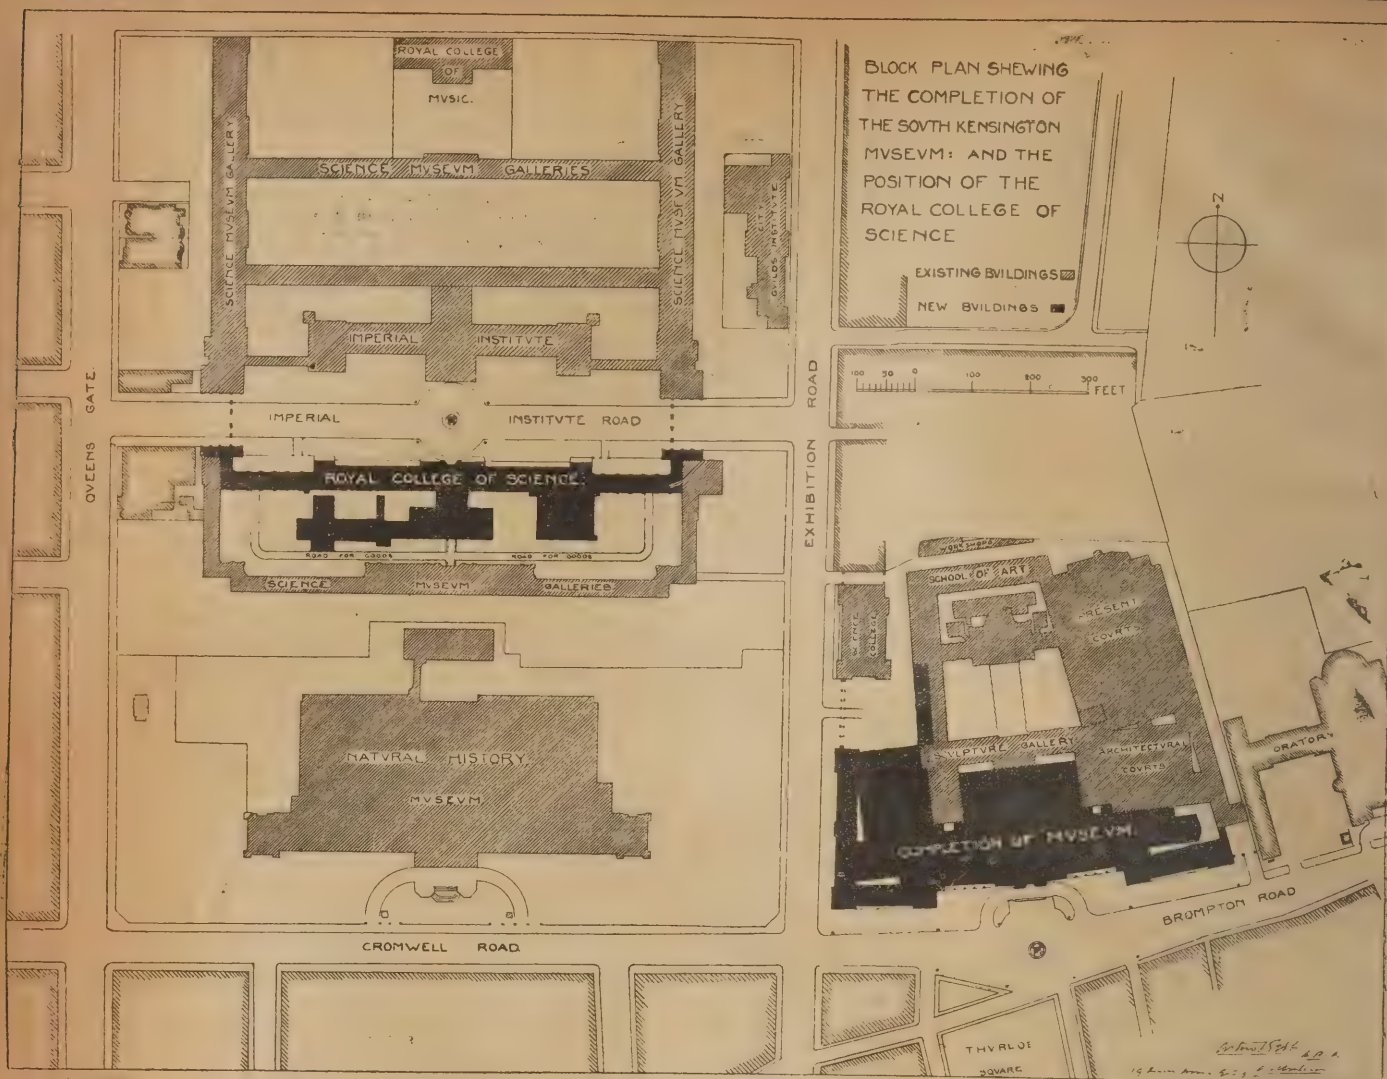

#### SOIL: THEORY AND KNOWN FACTS.

The question of soil in relation to the dwelling is necessarily one of great importance. Assuming, in the first instance, that the soil selected is pure, the lecturer confessed that he had no evidence that in the matter of wholesomeness there is any difference between rocks, sand, gravel, or chalk. Nor is there any evidence that either of these soils gives rise to unwholesome emanations. In cities, where organic filth has been buried in the soil for ages, it seems likely that the gases of putrefaction may gain access to the house. In London, when the soil is opened up, there is always a stink of illuminating gas, and, obviously, it is desirable to keep that out of our dwellings. Further, impurities from sewers and cesspools are sure to leak into the soils of populous places. Therefore, the model by-laws insist that the ground upon which a house is built shall be covered with a regulation thickness of concrete. This is a reasonable provision in a populous place; but so soon as a crack or pinhole is accidentally made in the concrete, the alleged security given by it vanishes. In country places which have adopted the model by-laws, the covering of pure chalk or sand or gravel with concrete is equally insisted upon before a cottage can be built. This has the effect of increasing the cost and rent of the cottage, unless it be thought advisable to make the floor of concrete finished with cement. It goes without saying that for houses built in low-lying damp situations, an impermeable layer of concrete is necessary. It is quite possible to build a house upon clay which shall be perfectly dry, and through clay unwholesome gases find it difficult to travel, which is a theoretical advantage. Fogs are frequent on clay lands; but it is not clear that an occasional pure fog does any harm to a healthy person. The foul irritating fogs of London are, however, dangerous to many and deadly to not a few.

#### WASTE WATERS.

The nature of the soil upon which a house is built has great influence on the ease with which the waste drainage waters are got rid of. On porous soils—such as sand, gravel, and many chalks—they soak away, and hence there has been a great temptation on such soils to construct

soak-away cesspools, which in the days of our ancestors, before the use of water-closets and fixed baths became general, were little likely to contain infective matter, and continued to act efficiently for years. Modern sanitation has raised the amount of waste water enormously, and the invention of the water-closet has greatly increased the danger and foulness of the waste waters. In conclusion, whether a house be on a permeable or impermeable soil: (1) all waste fluids should be dealt with before putrefaction sets in; (2) they should be delivered on to the surface, and not beneath the surface of the ground; (3) they should never be allowed to collect in cesspools, which encourage putrefaction, and merely postpone the inevitable work of distributing them over the ground.

A discussion followed, in which Mr. TILL, of Eynesford, Messrs. F. T. W. GOLDSMITH, E. SWINFEN HARRIS, W. BASSETT HOPKINS, W. H. SETH-SMITH, H. A. SATCHELL, A. S. FLOWER, and the President took part, and a hearty vote of thanks was accorded to Dr. Poore, who replied to various points raised.

#### THE A.A. TRAVELLING STUDENTSHIP.

The President announced that five sets of drawings were received in competition for this studentship. They were of exceptional interest and ability, and the Committee had awarded the Studentship to D. Theodore Fyfe, of Chetwynd-road, Highgate-road, N.W.; a second prize of £5 to Henry Tanner, jun., Queen Anne's-gate, S.W.; and hon. mention to H. Farquharson, of Leyland-road, Lse, S.E.

#### ELECTION OF OFFICERS AND COMMITTEE.

The President read the report of the scrutineers on the voting for officers and committee for the session 1899-1900 as follows:—President, Mr. G. H. Fellowes-Pryne; Vice-Presidents, Messrs. E. Howley Sim and H. T. Hare; Committee, Messrs. Beresford Pite, W. A. Pite, P. J. Marvin, A. H. Hart, F. G. F. Hooper, H. A. Satchell, M. Garbutt, W. A. Forsyth,

W. H. Seth-Smith, and A. T. Bolton; Hon. Treasurer, Mr. Hampden W. Pratt; Hon. Librarian, Mr. A. S. Flower; Hon. Secretaries, Messrs. G. B. Carvill and R. S. Balfour (the foregoing form the Committee); Hon. Solicitor, Mr. W. H. Jamieson; Hon. Assistant Librarian, Mr. W. B. Dukes; Hon. Auditors, Messrs. J. W. Stonhold and W. E. Davis; Assistant Secretary and Registrar, Mr. D. G. Driver.

The business of this session was closed at the end of a three hours' meeting by passing, by acclamation, of votes of thanks to the various retiring officers and members of committee.

#### VICTORIA AND ALBERT MUSEUM, SOUTH KENSINGTON.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THE very complete series of drawings which we publish to-day gives an admirable idea of the whole scheme of these new buildings, of which the Queen laid the foundation-stone on Wednesday. The general block plan accompanying these notes shows very distinctly how Mr. Aston Webb's additions combine with the existing galleries, as well as their relation to the Royal College of Science in Exhibition-road. A few weeks ago\* we illustrated Mr. Aston Webb's design for the new Science Buildings on the other side of the way, which will face the Imperial Institute, and occupy the site at the rear of the Natural History Museum. That part of the general scheme, however, has no structural connection with the larger group of new museum buildings in Cromwell-road; but inasmuch as the College of Science naturally formed a very important factor in the contrivance of the whole plan, it cannot be ignored even indirectly in a notice of this kind when dealing with the design now happily put in hand for execution. It is about eight years since the limited competition was held; when Mr. Aston Webb's design was

chosen. It will be found fully illustrated in the BUILDING NEWS for Aug. 7 and 14, Sept. 11, and Nov. 20, 1891. We likewise published all the other competitive designs at the same time. This week the drawings of the new scheme have been on view at H.M. Office of Works.

With these references and preliminary remarks we turn with renewed pleasure to the project as it will forthwith be realised. Several important changes have been made both in the plans as well as in the elevations; the former certainly are improvements, though we are not so sure that the alterations in the treatment of the façades will be altogether correspondingly welcomed. The plan gains very materially by the contrivance of the main façade in a quadrant line following the frontage boundary in Cromwell-road, and continuing the building line in Exhibition-road. The central portion of the south front is set back 30ft. The recasting of the plan in this manner not only enhances the picturesqueness of the distribution of its parts, but it has enabled the architect to utilise the site to a much better advantage. The new buildings will add 250,000ft. to the present floor area, which amounts to 180,000ft., so that the space covered will be more than doubled. The existing large quadrangle in front of the well-known refreshment-rooms will eventually be divided into two open courts by continuing the central avenue straight through from the principal entrance hall of the new museum buildings, and crossing on the way the antique cast-iron corridor. There is a dignified symmetry about the scheme which is always conspicuous in good planning, while the new parts are made to fit in ingeniously and squarely with the present buildings. Useful areas are introduced, where awkward deviations would otherwise occur, and, architecturally speaking, Mr. Webb's plan is well considered, and skilfully handled in a masterly way. The arcaded aisles or galleries, as they are called, dividing the southern courts from the north-west, and central courts, will afford scope for architectural effect in an unambitious manner,

\* See BUILDING NEWS, April 7, 1899.

design. This comparative failure of effective design which may thus be hinted is to some extent due, we fancy, to the size of the columns between the windows immediately over the entrance. The whole middle part might be lifted up and the detail made larger in scale. The freedom of treatment introduced by the angle-set buttresses furnishes ample excuse for a decided departure from the continuation of the secondary horizontal lines, which, quite apart from this central pavilion, are amply sufficient, if not in a minor degree excessive.

### SPECIFICATIONS.\*

(Concluded from p. 636.)

#### THE AMBIGUOUS "BEST."

THERE is one word in a specification of which the meaning is often disputed. It is the word "best" when applied to workmanship and materials, especially to materials, and is, I grant, somewhat ambiguous. But I would not use such terms as "best finest," "extra best," "super best," "best best," and so on; but merely employ the word best once and for all, and attempt to define its meaning. Here is a suggested definition of this word. "The word 'best,' as applied to materials, articles, and workmanship shall mean that there is no superior quality of material or finish of article in the market, and no better class of workmanship obtainable." In fact, by defining this word "best," it will only be necessary to mention it in the one clause when stating that all materials and workmanship are to be of the best quality and class.

#### MECHANICAL DEFINITIONS.

We are all apt to fall into the error of describing certain materials mechanically, such as timber from a market which has long since been entirely exhausted, or stone from a worked-out quarry, or we use misleading and exaggerated language, "timber free from knots," demanding what, in our own minds, we never expect to obtain. We should only specify what we can get, what we mean to have, and then see that we get it. At the same time we must not lose sight of the fact that our endeavour must be to obtain the most suitable and best material procurable in the market, and that the work when executed shall be a credit to all.

#### SUB-CONTRACTS.

As to the question of sub-contracts, this would take some time to discuss, but, as a general rule, let a sub-contract go through the general contractor; but when this is impossible, then make the sub-contractor subject to all the conditions of the main contract equally with the general contractor, and in the main contract stipulate that the general contractor is to give every facility to the sub-contractor, and allow him the use of his scaffolding and plant.

#### ARRANGEMENT OF STAIRS.

Having now, so far, settled the general scope and bearing of a specification, the next step is to put the various items into order and place. As I have before said, we cannot do better, generally, than divide the specification into separate headings or trades as they are called. As to the order in which these trades should be placed, I do not think that very important, only let each trade, if possible, come in the order in which the building would be erected. Thus the specification would be started with the preliminary items or general clauses, under which heading would come every item that would apply to the building generally as a whole. Then would follow the trade of excavator, this being the first start of the actual work. Then the trades embracing the structural parts of the building, such as bricklayer or mason, whichever trade would chiefly apply to the walls. In like manner you would go on constructing the building on paper until it was roofed in, when the trades taking the interior fittings, finishings, and requirements would follow, and finally the decoration and painting. As to what items each particular trade should embrace, or how many trades the specification should be divided into, that to some extent would be a matter of convenience and clearness, consequent on the nature of the building in question. Thus, if pavior is a considerable item, make it a separate trade, but if a very minor point, then the paving may come under the trade of bricklayer. Again, if the

drainage is a large item, I would make that a distinct trade, instead of putting it, as it is often done, under excavator. Further, floor and wall-tiling might either come under pavior, bricklayer, or plasterer, as each of these trades, in certain parts of the country, is performed by the same class of workmen. Many other items may be treated in the same manner. Each trade is

#### STARTED WITH A PREAMBLE

or the general clauses mostly applicable to all the items under that trade, such as the description of the various materials, and the general covering clauses referring to similar parts of the work in different positions; after which follow in detail the actual items of work. Strictly speaking, a preamble is an introduction or preface; but in a specification the term is applied in the sense of denoting the general clauses and descriptions at the beginning of each trade. Going more fully into the various items of almost similar description under each trade, I think the best plan, in most cases, is to describe all the items of a similar nature to each floor separately, from the lowest to the topmost story, continuing with other similar items on each floor. But if the description of any item will apply equally over the whole of the building, describe it so, without reference to each separate floor, and thus save useless repetition. As to the exact order of the various items under each trade, I would put them as far as possible in that order in which they would be built. But there is no hard and fast rule to follow in this respect, as in many cases it will be clearer to run them on, regardless of that order. When describing the items

#### DO NOT OMIT TO MENTION

the class of material: thus state the particular quarry and bed of stone, give the class of wood for the timber and joinery work, and state whether it is rough or wrot. A general clause, such as this, "that all exposed faces of timber and joinery work except where otherwise mentioned are to be wrot," will save repetition of this word "wrot." State if you mean Portland or other kind of cement; the word Portland is often omitted. And all other descriptions of materials should be clearly defined.

Reverting once more to what may be considered the best order in which to place the items of work under the various trades, I know that this is one of the chief difficulties of the beginner, and I will suggest an arrangement for some of the principal items. I have before mentioned that, as a rule, it is best to specify the items in that order in which the work will be built, but that it is not always possible to carry out that order. But I would say that, whatever order you once adopt, always follow in all your specifications and in all its parts, so that you will know yourself where to find an item. I have also said that each trade in every case should start with a preamble, or the general clauses and description of materials. Now to take the principal items under the various trades respectively.

#### IN PRELIMINARY ITEMS

I do not think any particular order is essential, but it would be as well to keep the clauses in that order which would mostly run with the order of the work to the building. If old buildings have to be removed, the description would come under this heading of preliminary items. But if a housebreaker is employed then this work would form a separate and distinct contract by itself. In Excavator take the surface excavation first, then the deep excavation, such as that to basements and cellars; then the general excavation to the foundations and the attendant items, such as planking and strutting, filling and ramming; and, finally, any other small or particular items. Then describe the concrete foundations, after which the surface concrete and any brick rubbish under, then the concrete floors, roof, and stairs. If the walls of a building are in concrete I would take these immediately after the concrete foundations, of which they then would almost form a part. Under drainage describe the manholes first, then the pipes with the concrete, then the gullies and other similar items. The items under the trade of pavior are so simple that any order might serve, but take first the important items of internal paving, and follow on with the smaller items, and finish with the external paving.

#### IN BRICKLAYER

commence with the general walls of the building, then the damp-course, hoop iron, and other attendant items. Then those parts in cement,

such as rough arches, trimmer arches, piers, sleeper walls, half-brick walls, and dry areas. Then the external facings and pointing, gauged or other external arches, dressings, mouldings and ornaments, external glazed brickwork, or flint facings. Then the internal facings and pointing, glazed brickwork, and wall tiling. Boundary and retaining walls, and such-like distinct items should come last, and be described separately and completely by themselves. Terra-cotta facings might either come with the other external facings or be kept as an item by itself after the description of the other general work, and before such items as boundary or other walling.

#### IN MASON

commence with the rough stones such as templates and corbels, if not elsewhere described, and follow on with the thresholds, sills, copings, internal pavings, staircases, hearths, and chimneypieces. Then the external paving, steps, and curbs. If the walls are built or faced in stone I would describe these first completely, with all the labours, mouldings, and ornaments on them, and then follow on with the rough stones and internal items, and finally with the external items, such as pavings, steps, and curbs. I would not trouble to keep all stone of a similar nature under the one heading, unless it should happen to come in that order. Many make

#### CARPENTER AND JOINER

two trades. In a large work perhaps it is better to separate them, but in a small work I should certainly keep them together. But it is immaterial whether they are separated or not as long as the descriptions are clear. Personally, I prefer them generally under one heading; you will perceive the reason from the order of the items I will now give you under these trades. Lintels, bresssummers, posts, cradling, floor and ceiling joists and plates, sound boarding roof or flat timbers, felt, battens, gutters, and all external joiners' work to the roof or flats, except windows, doors, and skylights, such as rolls, facias, barge-boards, and such-like items. Then would come quartered partitions, followed on with flooring, windows, skylights, external doors, internal doors, framed partitions, skirtings, dadoes, wall and ceiling panelling, staircases, sinks, water-closets, and bath casings, and other internal fittings, such as shelves, cupboards, and such-like domestic fittings. Fencing, weather-boarding, or other outside work should be complete items by themselves, and come last. Half-timber work, with all its attendant items, might, I think, come after the description of the rough timbers. I would not separate hard woods from soft woods, but describe them as they come on each separate story.

#### IN SMITH AND FOUNDER

take this order: lintels, chimney-bars, straps, girders, floors, columns, roofs, carriages, iron windows, gutters, stack pipes, external railings and gratings, stoves and ranges and heating. Heating may come under heating engineer. Under slater and tiler, roofs first, then vertical slating or tiling, shelves, cisterns, and such-like smaller items.

#### IN PLUMBER

take gutters, flashings, and other roof finishings, flats and their gutters, and finishings, then drinking-water supply pipes, cisterns, sinks, lavatories, baths, and fittings. Then water-closet supply pipes, cisterns, water-closets, slop sinks, urinals and fittings, soil and ventilating pipes, hot-water circulation.

#### ZINCWORKER AND COPPERSMITH.

Take flats, gutters, and finishings, pipes, lighting conductors. In plasterer describe first the general plaster work to ceilings, partitions, and walls, then follow with cornices, coves, centre flowers. Then those parts in cement, and, finally, the external plaster or cement work, or if preferred take the external work first.

#### GLAZIER.

External glass to skylights, windows, doors, then internal lights and screens, and pavement lights last.

#### PAINTER AND PAPERHANGER.

Internal work to ceilings, walls, wood and iron work, and polishing. Then external painting to wood, iron, and cement work. As to the order in the trades I have not mentioned, such as bellhanger, gasfitter, and electric-lighting

\* By F. W. MACEY. A paper read before the London Architectural Association on April 23, 1899.

engineer, which are not generally of any considerable variation, there is very little to suggest, but keep the order of the work, such as the main items first and fittings afterwards. I might mention that the order adopted in bills of quantities is not precisely the same in all parts as that of a specification. The order in quantities is placed to an extent to facilitate the pricing, and the order in the specification should be to distinguish quickly the position of the work.

## PRICES.

One word before I come to the last part of this paper. If the prices in a bill of quantities are not to be taken into account in the settlement of extras and omissions, or if quantities have not been supplied, then a schedule of items should be provided for the builder to fill in, and be attached to the specification and form part of the contract upon which variations may be valued.

## ADDITIONAL HINTS.

I have now, I think, stated the various points which are necessary to be observed for efficient specification writing, and I will just mention a few matters which are worthy of attention and which are not always found to be clearly stated in a specification, but are sometimes omitted altogether, taking preliminary items first. Always state that the plant and temporary erections are to be removed when directed, such as the scaffolding, hoarding, shoring, clerk of works' office, and any other items temporary in their character. The provision of these items is usually stated in the specification, but their removal is not always mentioned. State if the hoarding is not to be let to an advertisement contractor. Clearly define what you mean by prime cost and provisional amounts. State if the employer's business is to be carried on during building operations. Mention that the contractor is to give due facilities to other tradesmen who may be employed on the premises, and also that the contractor is to allow such other tradesmen the use of his scaffolding and plant. State to whom any coins or curiosities found on the premises or during the excavations are to belong. If the contractor has done any work previous to signing the contract, then embody this work in the contract, otherwise an extra may be claimed for some small items which at the time of signing the contract were understood to be included in the contract amount.

## EXCAVATOR.

Where the foundations in a length of walling are not all one level, require the excavation to be in steps and not on the rake. Stipulate that there should be no excavations for ballast or sand unless necessary for the actual excavations, as this may affect the stability of the building. Specify that brick rubbish be put under surface concrete which receives wood-block flooring or paving. There will then be less liability of damp coming through. In clay soils, require the foundations to be taken down below the action of the weather. This may necessitate the foundations being taken down some 4ft., 5ft., or 6ft. below an otherwise good bottom. Specify a proportion of coke-breeze, slag, or gypsum in concrete fireproof construction. It will the better resist the action of fire. State that all foul earth and cesspools are to be removed and the excavation filled up with clean rubbish or concrete. Encase new drain-pipes in concrete; if a slight settlement occurs, they will then the better hang together. Half-channels in manholes are better formed in cement than with half-pipes. A cleaner flow of sewage can thereby be obtained. Then as to the items under bricklayer. Do not forget to mention these points: To tie the walls in; to build external walls hollow, if possible, but in damp situations certainly; and specify the lead covering over the heads of doors, windows, or arches coming within the hollow space. This will prevent the wet being communicated to the inner thickness of the hollow walls. Describe a weather joint externally to brick walls. Build the brickwork up in even heights and fill up all the joints. Let the sand be free from dirt and the water clean. Sea water or sea sand may be used where dryness is not essential. Build chimney-stacks, where they appear above the roofs, either partly down from the top, or else wholly, in cement, preferably the latter. Build all parapet walls and the brickwork immediately under the eaves a certain distance down in cement, and a second damp-course here and to chimney-stacks will not be amiss. Half-brick walls should, of course, be built in cement. Boundary fence

walling should have a damp-course, and preferably be built in cement. In retaining walls against earth do not omit the weeping drains or other device for taking off the accumulating water at the back. Smoke flues should not be too large—9in. by 9in. is sufficient for most fireplaces; and gather the brickwork quickly over the fireplace openings. Build all stoves around solid, and fill up the boxings to chimney-pieces. Fires have often occurred through neglect of this precaution. Do not put too long a description to terracotta work because it may be the custom. Put a straight joint between connecting walls and a heavy tower, and do not attach a large chimney-shaft to the main structure.

## MASON.

Stone templates should be of considerable area and tooled, and not left rough. In fact, any stone upon which work is built should be tooled as a least labour on it. Do not forget the cement packing between the rivet heads on the top of flange girders and the cover stones. Stone hanging steps are almost better placed in position and pinned in after the building is up, sand courses being left in the brickwork for this purpose. In stone columns or pilasters the apophyses should be worked on the shafts. The effect is better. Portland cement will stain delicate marbles and some limestones.

## CARPENTER AND JOINER.

When possible, employ wood-block flooring on the lowermost floors next the ground. The ordinary joists and flooring for this position are more liable to decay. In this latter case let the joists and plates be of oak. Put cast-iron shoes or stone bases to all solid door-frames. Bed window-sills on to the stone sills in white-lead, and do not omit the iron tongue. The cleats to roof-trusses and horns on solid door-frames are sometimes forgotten. Snow-boards to roof gutters will often prevent wet penetrating when the snow melts. Open casement windows outwards if you want to be perfectly sure of keeping out the wet. The ends of timbers, where bedded in walls, should have a circulation of air around them. A little sap on the edges of timber exposed to the air will not be any very great source of weakness, and it will not be likely to affect the rest of the timber. All gutters should be wide enough to walk along. Small angle fillets at the junction of horizontal and vertical planes of a roof flat will make better work than if the leadwork be turned up sharply. This remark will also apply to lead gutters. In some cases it is almost preferable to put a p.c. amount for the ironmongery to each door, window, or other fitting, and select the class of ironmongery afterwards. Slater and Tiler.—Tiles and slates without boarding under should be torched. Smith and Founder.—Let rain-water pipes stand out about 1in. clear of the walls.

## PLASTERER.

Timbers over 3in. wide should have the arrises taken off before the lathing is nailed on; this will enable the plastering to get a better key. The walls at the backs of skirtings, or any other woodwork, should be plastered over to prevent vermin harbouring. The outside of all flues between timbers, floors, and where in the roof, should be roughly rendered over. This will be a preventive against fire. Single laths should not be lapped at the joints, as is often done.

## PLUMBER AND GASFITTER.

Do not omit the exhaust-pipe to hot-water circulation, or to the heating arrangements. Keep all hot and cold water pipes well away from each other, and from the action of frost. All pipes, whether gas or water, should be readily accessible, and, if possible, on the face of the walls. The furring-up of hot-water pipes is chiefly found between the boiler and the circulating cylinder or tank. This portion of the piping should be easily accessible for cleansing. All horizontal gas pipe should be laid with a fall, to prevent any condensed liquid remaining in any part of the pipes, and thereby affecting the efficiency of the gas supply. It is a good plan to fix all internal pipes about ½in. clear of walls, especially hot-water pipes. Do not work the hot-water supply and heating arrangements from the same boiler. Failure is almost certain.

## GLAZIER.

All glass subject to jars should be bedded in wash-leather or indiarubber as well as in putty. I might mention that one of the best methods for glazing skylights is merely to seal the glass on a

bedding of putty, and then to sprig it in and paint the joint over with the woodwork of the bars. It is perfectly watertight, and there is no putty on the weather side to get out of order. This plan is much adopted in horticultural buildings, both vertically as well as in the top-light glazing. The laps of the glass to top light should be cut to a curve, the water being directed down the centre of the glass and away from the rebates in the bars.

## PAINTER.

External painting if done in the spring or autumn will give a more satisfactory result. No painting, papering, or other decoration should be done while there is a suspicion of dampness about the building. All ironwork should be well painted over before it is buried or covered up.

## WATER COLOUR DRAWINGS.

AT the Fine Art Society's Galleries, 148, New Bond-street, is to be seen a collection of water-colour drawings by Mr. Arthur Severn, R.I., a painter whose personal connection with Mr. Ruskin has led him to depict many of the beauties of the Lake district. Such drawings as "Entrance to Mr. Ruskin's Garden, Brantwood," views of the Cumberland coast, Coniston Lake, "Hyacinths at Brantwood," "Heather above Brantwood," show the great appreciation Mr. Severn has for this district, and the varied moods which season and atmosphere impart to the scenery. Coniston Lake is the subject of several sketches, showing sunrise and evening on the "Old Man," Autumn sunset, and other effects on the lake. Mr. Severn's forte is in sea, sky, and cloud effects, and we may notice the drawings of "Sunset at Seascale," the sea, and coast in "Afternoon Effect, Seascale," "After Storm, Cumberland Coast," a rough sea effect. The sunlight and colour of "Seascale Dieppe," "Cloud Effect, Seascale," "Stormcloud," at the same coast. The cloud studies, as in "Afternoon Effects," No. 80, represent a stormy sky and sea, the light bursting through the grey cloud and lighting up the sea near the horizon. Mr. Severn is also a close observer of rocks. His view of the "Rock at Monaco" the "Limestone Gorge, Constantine, Algiers," are clever rock studies. The view of "Avignon," the clever drawing of "The Dee, Kirkcudbright," splashing over rocky bed between trees; the dark mass of hills and reflection of sky in water, "Evening from Brantwood," are all characteristic studies. Several views of the Tower Bridge are shown by moonlight, sunlight, and evening effect, and the views of Westminster, especially No. 73, showing the Palace through a vale of smoke and vapour, and at sunset, are worth notice. The Land's End and views from Florence, the Riviera, Venice, Algiers, Abbeville, a sketch of the front of the cathedral, views of Cromer, St. Ives, &c., are in this collection, and are interesting as depicting natural effects under varied conditions. Mr. Severn uses freely body colour, which imparts to many of his works a depth of tone unattainable with water colour.

## THE SURVEYORS' INSTITUTION.

THE following Student Candidates have passed the Examination for the Professional Associateship:—

Rowland William Alderson, Leek Wootton, Warwick; John William Wilson Armstrong, Blaenau, Stratford-on-Avon; Ernest Witton Booth, Surveyor's Office, Town Hall, Morley, Yorkshire; Arthur George Bradshaw, 7, Gage-street, Lancaster; Clement Joseph Bentley Bridge-water, 94, Portland-place, W.; Basil Vassar Bruton, 29, Fleet-street, E.C.; Geoffrey Redmore Church, 2, Steeles-road, South Hampstead, N.W.; George Harry Cole, 10, Fernshaw-road, Chelsea, S.W.; George Edwin Cragg, 19, Greenside, Kendal, Westmoreland; George Herbert Croft, 10, Sussex-square, Brighton, Sussex; George Alfred Cutler, West Bank, Lewisham Hill, S.W.; Henry Dann, jun., Gwynant, Overcliffe, Gravesend, Kent; John William Statterley Humphreys Davies, 27, Kensington Park-gardens, W.; Henry Arthur Armitage Gate, 20, Mecklenburgh-square, W.C.; Herbert Alexander Glead, 21, Flodden-road, Camberwell, S.E.; James Caulfield Goff, Laurel Hill, Kingstown, Co. Dublin; Alfred Goodman, West Springfield, Upper Clapton, N.E.; Ronald George Gurney, Brook-street, Aylesbury, Bucks; John Sebastian Hall, Valkyrie, Muswell Hill, N.; Tom Percy Hartley, "Uffculme," Garlinge-road, West Hampstead, N.W.; Lancelot Gouldar Hawkins, Downham Market, Norfolk; Edward Robert Hinchliff, 23, Victoria-street, Crewe, Cheshire; Michael Anselm Hindmarsh, Crag View, Alnwick, Northumberland; George Howland, Rushmead, Colleshill, Amersham, Bucks; Percival Hurlbutt, Queen's Ferry, Flintshire, North Wales; George Potter Knowles, 15, Argyle-square, W.C.; Ninian P. Laird, Kirby Muxloe, near Leicester; Sydney Martin Lampard, 114, Clapton

Common, N.; Henry Lemmoin-Cannon, 252, Brixton Hill, S.W.; Hudson Little, Rose Villa, Winton-road, Carlisle; Edward Adrian Lumley, 22, St. James's-street, S.W.; Sydney Mager, 28, Carleton-road, Tufnell Park, N.; Thomas James Meaby, jun., Canford, Wimborne, Dorset; Henry Arthur Newman, 48, Constantine-road, Hampstead, N.W.; Shirley Herbert Potter, 1, Wyndham-road, Edgbaston, Birmingham; Frank Percy Pratt, Castle House, Ongar, Essex; Thomas Reginald Ransom, Dunkeld, 59, Ritherdon-road, Upper Tooting, S.W.; Douglas William Reeve, St. Moritz, Mulgrave-road, Sutton, Surrey; Maurice Charles Riddett, Highclere, Ryde, Isle of Wight; Arthur Dennett Rutley, Birchwood, Caterham Valley, Surrey; William Henry Sanday, Blackwell Hall, Chesham, Bucks; Stanley Lunau Sandell, Belcaire, 77, Widmore-road, Bromley, Kent; John Henry Simpson, The Estate Office, Bryanston, Blandford; John Ambrose Smith, Tatton Dale, Knutsford, Cheshire; Frank Vincent Tait, 31, Pepper-street, Chester; Frank Treacher Terry, 8, Hopton-road, Streatham, S.W.; Arthur Henry Tyack, 88, Mosley-street, Manchester; Cyprian Charles Oswald Whiteley, 44, Ellison-road, Streatham Common, S.W.; Sidney Prudden Wigley, 29, Fleet-street, E.C.; Arthur Codrington Williams, Moor Court Farm, Sparsholt, Winchester, Hants; Thomas Henry Wright, "Hawkhurst," Terrapin-road, Upper Tooting, S.W. \*Special Prize. +Institution Prize.

The following Non-Student Candidates have passed the Examination for the Professional Associateship:—

Gordon Campbell Atkinson, 162, Mercers-road, Tufnell Park, N.; Frederick George Barker, Bridge House, Fordingbridge, Hants; Alfred William Baylis, 9, Thanet-road, Erith, Kent; Edmund Brand, 2, St. Andrew's-place, Lewes, Sussex; Frederick George Brooker, Elm Bank, Hitchenhatch-lane, Sevenoaks, Kent; William Nathaniel Brooks, Durwards, Witham, Essex; Ernest Newth Buttenhaw, South View, Sunnyside, St. Alban's, Herts; Richard Herbert Chichester, Cheswardine, Market Drayton, Salop; Leonard Eustace Clarke, 9, Chichester-street, W.; James Thomson Cole, Fell-court, Torquay, Devon; Edward Arthur Cook, Bennington Lodge, Framlingham, Suffolk; Arthur Wesley Crampton, The Park, Mansfield, Notts; Hollis Augustus Crook, 43, Bridge-avenue, Hamersmith, W.; Herbert Hood Daniel, Hill-End House, Henbury, near Bristol; Robert Harvey Addington Delves, Stamford House, Derby-road, Woodford, Essex; James Murgratroy Dickinson, Millans Park, Ambleside, Westmoreland; Eustace Cyril Theodore Dodd, Belle Vue, Ashcroft, Cirencester; Dugdale Oakley Dunlop, 20, Booth-street, Manchester; Hugh Wicksted Ethelston, Hinton, Whitchurch, Salop; Alfred Charles Stanley Fowler, 53, Oakfield-road, Stroud Green, N.; George Freeman, 44, Alexandra-road, Wimbledon, S.W.; William Pope Genge, jun., North Curry, Taunton, Somerset; Arthur John Hooley, The Poplars, Allestree, Derbyshire; Arthur Ernest Hope, 13, St. George's-square, Forest Gate, E.; Alan Herbert Howgrave-Graham, 12, Willow-road, Hampstead, N.W.; George Whitaker Hunt, South Eastern Agricultural College, Wye, Kent; Alexander Pearson Jolly, 6, Northbrook-street, Newbury, Berks; Philip Vivian Jones, Wood View, Hengoed, via Cardiff; George William Cairer Kelly, Pembroke-street, Appleby, Westmoreland; Albert Tommons Latham, 5, Grosvenor-road, South Norwood, S.E.; Walter Bernard Laurence, 61, Eardley-crescent, Earl's Court, S.W.; Leonard Lickis, 33, Whittinghall-road, Parson's Green, S.W.; Albert Daniel Lomas, 8, Chatham-place, Liverpool; John Luke, jun., Corporation-road, Belgrave, Leicester; Dyneley Luker, 19, Waldeck-road, Ealing, W.; Humphrey Dod Lynes, Estate Office, Glanllyn, Bala, North Wales; Douglas Samuel Matthews, 650, Fulham-road, S.W.; Percy William Meredith, 20, Deerbrook-road, Herne Hill, S.E.; Frederick Walter Merrick, Poplar House, Stanwell Moor, near Staines; Ernest William Moat, 67, Kennington Oval, S.E.; Elvin Fowley Mumby, 8, Trinity-road, Upper Tooting, S.W.; Emmanuel Joseph Oram, 42, Lansdowne-road, Tottenham, N.; William Arthur Paliser, Featherstone, Yorks; Herbert Mostyn Parry, 9, Irving Mansions, West Kensington, W.; John Stonehouse Petcl, Haltwhistle, near Carlisle; Roger Prosser, University College of Wales, Aberystwith; Alfred Ernest Protheroe, Bourn House, Leytonstone, E.; Ernest Edward Richardson, 23, Trinder-road, Crouch Hill, N.; Philip Robertson Sandhills, Monkton, Ayrshire, N.B.; Samuel Messiter Rowlandson, 19, North Bailey, Durham; Arthur Lionel Rutter, 62, Sidney-street, Cambridge; Hubert Corvell Sands, 67, Pelham-road, Gravesend, Kent; Douglas Smith, Windsor Estate Office, St. Fagan's, Cardiff; Robert Stephenson, jun., Burwell, Cambridgeshire; Edward Frederick Stimson, 8, Moorgate-street, E.C.; James Henry Sutcliffe, Hazelwood, Hedden Bridge, York; Francis William Terry, Stratton Straules, Norwich; George Thomas, 10, Waterloo-place, S.W.; Richard Squire Thorne, Agricultural College, Reading; Leonard Fielder Thurgood, Ringwood, Upper Richmond-road, Putney, S.W.; Arthur Tighe, 55, Durlston-road, Upper Clapton, N.; Henry Turner, 21, St. Paul's-road, Preston, Lancashire; Marcus Oswald Type, "Glendenthorpe," Trafalgar-road, Moseley, Birmingham; David Alexander Watson, Estate Office, Shirkburn, Wallingford; Henry Stanton Webber, 8, Craufurd Rise, Maidenhead, Berks; Frederic Beauchamp Wells, Carlton Chambers, Baldwin-street, Bristol; Herbert James West, Mount Carron, Hainault-road, Leytonstone, E.; Edward Box Wetenhall, 27, Fitzroy-street, Fitzroy-square, W.; Percy Newton Wilkinson, 3, St. Mark's-square, Regent's Park, N.W.; James Bernard Witham, Oakleigh Boothroyden, Rhodes, near Middleton, Manchester; Frank Sydney Woodcock, 245, Underhill-road, East Dulwich, S.E.; Francis Edward Yewdall, 6, Ellington-street, Barnsbury, N. \* "Driver" Prize and "Penfold" Silver Medal.

IRISH CANDIDATES.—Donough Richard O'Brien, 16, Upper Mallow-street, Limerick; George Pakenham Stewart, Laragh, Killiney, Co. Dublin.

The following Professional Associates have passed the Examination for the Fellowship in Division IV.:—

Sydney Wood Ambler, 10, Leighton-street, Woburn, Bedfordshire; Francis Houghton Angel, 50, Russell-road, Kensington, W.; Bernard Beresford Baddeley, "Lakefield," Woodberry Down, N.; Geoffrey Clinton Baker, 19, St. Anne's-crescent, Lewes, Sussex; Stephen

Allen Barns, 51, Brooke-road, Stoke Newington, N.; Joseph Grant Bickford, 23, Charleville-road, West Kensington, W.; John Bowyer Bird, 25, Harrington Gardens, S.W.; \*John Friendship Bowden, Park View, Barnstaple, Devon; William Newbegin Brackett, 83, Maldon-road, Colchester, Essex; Albert Ernest Butler, Agricultural Chambers, 20, Blagrove-street, Reading; Charles Butler, 14, Queen-street, Huddersfield, Yorkshire; William George Cope, 8, Orchard-street, Portman-square, W.; Norris Tynwald Cowin, 21, Argyle-square, King's Cross, W.C.; William Thomas Cresswell, Barrack Reconstruction Office, Colchester, Essex; Charles Tylee Cronk, Sevenoaks, Kent; Cecil Goldar Fearn Culverhouse, 9, Whitehall-place, S.W.; Thomas Samuel Dangerfield, 14, St. George's-terrace, South Kensington, S.W.; John Everington, Merton House, Dulwich Wood Park, Norwood, S.E.; Frederick Russell Fox, Imperial Hotel, Barnstaple, Devon; Robert Strachan Gardiner, Crosswood Estate Office, Wenait, Aberystwith; Douglas Fleet Goldsmith, Lavant-street, Petersfield, Hants; James Gunter, Estate Office, Glasbury, Radnorshire; John Edward Harrison, Estate Office, Allestree, Derbyshire; Mackintosh Meleng Holl, Sywell, Northampton; John Murray Kerr, Summerfield Park, Llanidloes, Montgomeryshire; Charles Frederick Dashwood Lang, Vigo House, Weybridge, Surrey; Donald Lloyd Wells, Somerset; Arthur George Marshall, 1, Army and Navy Mansions, Victoria-street, S.W.; Arthur Morris, 15, Denbigh-place, S.W.; William Henry Morris, West House, Chirbury, Shropshire; John Oscar Nesbitt, 6, Limefield-terrace, Levenshulme, Manchester; Robert Mathewson Ogilvie, 10, Bolstro-road, Hayward's Heath, Sussex; Roger William Oldnall, Gorst Hall Farm, Kidderminster; William Henry Pain, 40, Navarino-road, Hackney, N.E.; Richard George Gordon Reed, Glendevon, Addiscombe-road, Croydon; Arthur Bayliffe Richardson, 78, King Edward-road, South Hackney, N.E.; Archibald Lacy Scott, Bury St. Edmund's, Suffolk; John Eustace Seeker, Estate Office, Warrington; Alfred Sydney Edward Sedgwick, 195, Tulse Hill, S.W.; Robert Harold Seal, Theatre Royal Chambers, St. Mary-street, Cardiff; Harold Sheldon, Town Hall Chambers, Middlewich, Cheshire; Charles Ayre MacKenzie Skues, Hyrst View, Campden-road, South Croydon; George Henry Smith, Brooklands, New Malden, Surrey; +Sydney Arthur Smith, Head Master's House, Maitland Park, Haverstock Hill, N.W.; Herbert Percy Stimson, 2, New Kent-road, S.E.; Frederick Stanley Sutton, Willow Cottage, 133, Brixton Hill, S.W.; Horace Clare Waterfield, 30, Prince's-square, Bayswater, W.; Reginald Spencer Wigram, 12A, Savile-row, W.; Charles Albert Willoughby, 23, Friends-road, Croydon; Frederick Robert Wilson, 10, St. Nicholas-road, Upper Tooting, S.W.; Thomas John Young, South-Eastern Agricultural College, Wye, Kent. \* "Crawter" Prize. + "Penfold" Gold Medal.

The following Candidates have passed the Direct Examination for the Fellowship:—

Frank William Booker, Short Hill, Hollow Stone, Nottingham; William Harold Eve, 10, Union-court, E.C.; Banister Flight Fletcher, 23, New Bridge-street, E.C.; Thomas Marcus Houghton, 15, Montholme-road, Wandsworth Common, S.W.; Samuel Brown Saunders, L. and A.W.R.E. Estate Offices, Waterloo Station, S.E.; Arthur Courtenay Scott-Smith, 10, Gandy-street, Exeter, Devon; Thomas William Harris Taylor, Trehid Estate Office, Camborne, Cornwall; Thomas John Woodrow, Cedar Lodge, Feltham, Middlesex.

#### OBITUARY.

MR. GEORGE FOSBERY LYSER, late Engineer-in-Chief of the Mersey Dock Board, died at his London residence on Thursday night in last week from pneumonia. Mr. Lyster was born in Ireland in 1821, and was for many years regarded as one of the most eminent dock engineers in the world. He carried out a number of important engineering works before his appointment by the Mersey Board in 1861. That position he held until two years ago, when he retired, his son succeeding him as Engineer-in-Chief. The Liverpool Docks were practically remodelled under his direction, at an expenditure of 19 millions sterling.

A new drill-hall is being erected at Hanley, and special consideration is being given to the ventilation, which will be carried out on the Boyle system.

Lord Rothschild took part on Friday at the completion of the Cable-street Board School, St. George's-in-the-East. The building affords accommodation for 404 children in the upper standard, and is supplied with a gymnasium and workshop.

The Chester-le-Street Rural District Council have adopted plans, estimates, and a report submitted by Messrs. D. Balfour and Son, civil engineers, Newcastle, for a proposed new road from New Washington to Jingling Gate, near Felling. The road will be about 1½ miles in length, will be 30ft. in width, and will have footpaths at the sides. It will provide a practically level road from Hetton, Houghton, the Herringtons, Penshaw, and Washington, to Gateshead, thereby avoiding the heavy hills on the present route by Birtley and Wrekenton, &c.

At the Audit House, Southampton, on Wednesday week, Mr. F. H. Tulloch, M.Inst.C.E., one of the Local Government Board inspectors, held an inquiry relative to an application by the town council for sanction to borrow the sum of £1,200 for the purchase of land in Duke's-road, Portswood, for purposes of a depot, and for works of paving and sewerage. Mr. W. S. G. Bennett, the borough surveyor, explained the proposals.

## Building Intelligence.

**BIRMINGHAM.**—On a site at the corner of John Bright-street, Station-street, and Suffolk-street a series of residences is to be built on the flat principle, after the style of the "mansions" which prevail in the Metropolis. The plans, which have been prepared by Messrs. Newton and Cheate, Newhall-street, provide for a red brick building, domestic in character, and three stories in height. On the ground floor shops will be arranged with separate entrances, basements, and conveniences, while above will be twelve sets of chambers, four on each floor. The cost of the building is estimated at £5,000.

**NOTTINGHAM.**—The Mundella Higher Grade School and School of Science has been opened by Sir George Kekewich. The larger school is in two separate blocks, divided into the Higher Grade and Science Department, and the laundry, gymnasium, and dining-rooms. In these accommodation is provided for 402 girls and 502 boys; whilst in a neighbouring building 230 infants will be accommodated. The front of the Graded School is of brick, with yellow terracotta dressings. On the ground floor is situated the girls' school, with assembly hall, 64ft. by 30ft. in width; on the first floor is the boys' school; and the laboratories, lecture-room, and drawing-class rooms occupy the second floor. The gymnasium; in the southern block, is 44ft. by 22ft. The infants' school has a central hall, 48ft. by 27ft. The contract for the schools and out-buildings, exclusive of fittings, amounted to £17,146. Messrs. J. Wright and Sons, of Nottingham, have supplied the school fittings.

**PONTYPOOL.**—The Pontypool Town Hall, designed in 1854 in the Italian Renaissance style by Messrs. Bidlake and Lovatt, of Wolverhampton, and opened in 1856, is now undergoing repair, alteration, and general decoration, including a heating chamber and heating scheme, some additional rooms, re-slating and leading, new illuminated clock faces (four), and the re-casting of the clock bell, all designed by and being carried out (by Messrs. Morgan and Evans, builders, of Pontnewynydd) under the superintendence of Mr. Robert Williams, F.R.I.B.A., of Lee, S.E., and Pontypool. The bell, from full-sized details prepared by the architect, will be cast in the town.

#### CHIPS.

The Duke and Duchess of York will, on June 22, open the Milton House, a home for 24 boys, at the Colony, Chalfont St. Peter's, and also the home for 24 girls which Mr. J. Passmore Edwards has likewise erected for the National Society for the Employment of Epileptics. The Greene Home, for 24 men, will also be opened, and the Isolation Home erected at the cost of Mrs. Darmer. The architect of all these buildings is Mr. Maurice B. Adams, F.R.I.B.A.

The first of the four great windows in the Lady-chapel of Gloucester Cathedral, which it is intended to fill with stained glass, has been completed. The window is the gift of the Baron de Ferrière. The upper lights contain angels of the highest dignity on thrones, together with the Archangel Gabriel. The scene of the Incarnation occupies the middle lights. The third tier contains British saints—St. Patrick, Bede, Helena, Bridget, and David. The small lower light represents scenes taken from their lives. The Dean hopes before the end of the present year two more windows will be completed.

New banking premises have been built by Messrs. Bolitho and Co. in Princess-square, Plymouth, and were opened yesterday (Thursday). Mr. C. H. Tozer, of Plymouth, was the contractor.

The last of the five windows in the new chancel of Whitfield Church, Glossop, has now been filled in with stained glass by Messrs. Ward and Hughes, the subject being the Nativity.

The finance committee of the Liverpool City Council have received an application from Messrs. Gamon, Farmer, and Company, solicitors to the Bishop of the diocese, asking for an extension of the time allowed for the demolition of St. George's Church.

The Barrow Town Council have decided to go on with the original scheme for a new technical school at a cost of about £15,000. Plans were drawn up some time ago by Messrs. Woodhouse and Willoughby, of Manchester, but they were objected to as being too costly. These have been modified, and, although the cost will now be £5,000 more than the amount originally contemplated, the council will proceed with the scheme.

## Our Illustrations.

VICTORIA AND ALBERT MUSEUM, SOUTH KENSINGTON.

(For description and further plans of this important building, of which the foundation-stone was laid by the Queen on Wednesday, see p. 666.)

## ROEDEAN SCHOOL, BRIGHTON.

THIS drawing, by the architect, Mr. John W. Simpson, is on view at the Royal Academy this year. The birdseye perspective, shown at Burlington House last summer, appeared in our pages for August 13, 1897, when a block plan was given, with a descriptive account of the work. The buildings, which are very extensive, are now in course of completion. The school occupies an elevated site overlooking the sea between Brighton and Ovingdean. The present view furnishes a more detailed sketch of the central part or school-house proper, with houses Nos. 2 and 3 to the right and left of the recessed quadrangle. The middle portal seen in the sketch leads into a wainscoted hall, and from thence an oak stairway rises by a dual flight as an approach to the great hall used for the assembly of the school. This apartment is located to the rear of the clock tower. The classrooms extend along the front of this middle block, and the big bay window over the entrance marks the mistresses' drawing-room. The head mistress's office is to the right hand of the porch. The upper range of rooms is devoted to the mistresses. The school comprises four boarding-houses in addition to the school block, and the music-rooms are situate to the back of the large hall. These houses are each distinct, with separate rooms for each of the forty pupils. Connecting corridors unite the whole together. A large gymnasium is a very real attraction. In each house there is a girls' dining-room, girls' drawing-room, house-mistress's study, preparation-rooms, prefects' studies, and complete accommodation, with kitchens, &c., for a distinct staff. A laboratory and adjacent classrooms are very complete in their appointments. Red bricks and rough-cast are used for the walling, and stone for the dressings. The roofs are covered with tiles. The chapel has not yet been built. From its position and size the school at Roedean makes a conspicuous feature in the landscape viewed from the marine parade at Kemptown. We gave a bird's-eye view of the building on Aug. 13, 1897.

## NO. XV. DEVONSHIRE SQUARE, E.C.

THIS building, situated on the north side of Devonshire-square, is wholly occupied by a firm of solicitors, and was specially designed to meet their requirements, containing on four floors rooms for the partners and offices for the clerks, the top floor being used as a caretaker's house. Fireproof construction has been used for all the

floors. The wood finishings internally are in varnished pitch-pine. Externally, red bricks and Monk's Park stone has been used. Our illustration is reproduced from the drawing in this year's Academy Exhibition. Mr. Howard Chatfield Clarke was architect for the building, and the contractors were Messrs. Woodward and Co.

## NEW STAIRCASE, WARNHAM COURT.

THE staircase shown in our illustration, from the architect's Royal Academy drawing, is part of a scheme for enlarging the main hall, and for giving more prominence to the main staircase of the house, which has hitherto been hidden away behind the end wall of the hall. The work entailed the removal of this wall and of the external wall of the old staircase, the latter being rebuilt some 5ft. or 6ft. further out, and containing a fine oriel window, which sheds a flood of light into the large hall. The staircase is entirely of oak, and was executed by Messrs. J. Thompson and Co., of Peterborough, who also carried out the structural alteration referred to. The architect is Mr. Arthur C. Blomfield.

## ST. LUKE'S CHURCH, MUNICH.

WE continue our illustrations of this church, of which a description was given last week, with the exterior and interior views, by a cross-section of the building looking west, and a plan.

## ALTAR SCREEN, WINCHESTER.

By an inadvertence in our descriptions last Friday the photograph reproduced was attributed wrongly to Messrs. Bolas and Co. The excellent view was taken by Mr. H. W. Salmon, of High-street, Winchester, whose beautiful photographs of architectural subjects particularly are well known.

At the last meeting of the Bradford Corporation the salary of Mr. J. H. Cox (city surveyor) was increased from £650 to £750, an amendment to refer the matter back to the committee being rejected.

Mr. Arnold Royle, C.B., on behalf of the Local Government Board, held an inquiry on Friday at the Salford Town Hall with reference to an application of the Salford Corporation for permission to borrow the sum of £19,550 for the extension of Ladywell Sanatorium. Mr. Henry Lord, of Manchester, the architect, explained the plans, by which 80 additional beds will be provided for patients, and twelve more beds for nurses.

The churchyard cross at Plymtree, South West Devon, was rededicated last week, after restoration, at a cost of £600. The head of the cross was found when the foundations of the new church-house were being dug two years ago. This, it was found, fitted exactly on to the shaft which was built into the Rectory garden wall. A new base only was wanted. The cross dates from the 13th century. The shaft and head were of one piece of granite, standing on a broad granite base with steps. Let into the sockets on the face and back of the cross head were carvings in some softer stone, probably representing, on the front our Lord's crucifixion, and on the back a figure of the Virgin. The cross now stands considerably over 10ft. high.

On the site of St. John's Church, Driffield, last week, the foundation-stone was laid of a new structure, to replace a wooden building erected 20 years ago. The church will consist of a nave and chancel, with transepts. It will seat 419 persons. The cost is estimated at £3,500. Messrs. W. Leason and Son, of Driffield, are the sole contractors, and the woodwork will also be done in the town by Messrs. Shepherdson and Son, Limited. The architects are Messrs. Hicks and Charlewood, of Newcastle-on-Tyne. Mr. Joseph Berry, of Driffield, is the clerk of works.

On Wednesday week St. John's Mission Hall, Cobham, Surrey, was dedicated for religious services by the Bishop of Guildford. The mission-hall has been designed by Mr. Leonard Martin, architect, of Cobham, and the building erected by Mr. A. Newland, of Church Cobham. The floor is laid with wood squares, and the seats accommodate 180 worshippers. The choir-stalls are of old English oak, costing about £160.

On Saturday, the foundation-stone was laid of new schools in connection with St. Andrew's Church, Wolverhampton. The entire scheme will cost about £4,000, but at present it is proposed to build only rooms to accommodate about 600 girls and infants. The school will be two stories high, and the upper floor will be used for the girls. The material will be red brick, with Hollington stone dressings, and the roof will be covered with tinted tiles, while internally the walls will be covered with enamelled bricks, and the fittings will be of pitch-pine. The architect is Mr. F. H. Lynes, and the builder is Mr. J. Herbert, both of Wolverhampton.

## COMPETITIONS.

HORFIELD, BRISTOL.—In a competition for a new Baptist Chapel and class-rooms, to be built at the corner of Gloucester-road, and Brynland-avenue, the plans of Messrs. R. Milverton Drake and Pizey, of Bristol, have been selected by the professional assessor appointed by the committee. Acting upon his award, the church have decided to go forward with the building, and have commissioned the authors to carry out the work forthwith. The cost of the scheme will be between £6,000 and £7,000.

MORECAMBE.—The school board has decided to advertise for competitive designs and estimates for the proposed new central schools in Station-road. The schools are to be in three departments, accommodating 500 boys, 500 girls, and 400 infants. The competing architects must reside or have an office within the school board district. The schools are to be a two-story building, with central hall for each department. The front of the building is to be of stone.

RAMSGATE.—Only four designs were submitted for the New Hall scheme for dealing with the Paragon Gardens on the West Cliffe Promenade at Ramsgate. The assessor has not yet been appointed to assist the Council in arriving at an award.

## OHIPS.

The Board of Trade have recently confirmed an order authorising the construction of light railways in the county of Middlesex from Uxbridge to Hanwell.

A receiving order has been made in the Leicester County-court against Herbert Carrington, builder and contractor, of Beatrice-road, Newfoundpool, Leicester. Debtor, in his statement of affairs, returns his unsecured liabilities at £3,830 4s. 3d., and his assets at £941 10s. 10d., leaving a deficiency of £2,888 13s. 5d.

The church of the Holy Trinity at Westward Ho! was built just 30 years ago, from the designs of Mr. William Oliver, architect, of Barnstaple. It has now been furnished with an oak reredos, 13th-Century in style, like the building itself, and executed by Messrs. Harry Hems and Sons, of Exeter.

St. Andrew's Church, Exmouth, having been completed, the newly-added portion was dedicated by the Ven. Archdeacon Sandford on Wednesday week. St. Andrew's Church will now seat about 550 persons. The expenditure entailed has amounted to £1,811.

The Hampshire County Council decided, on Monday, to purchase a farm in the neighbourhood of Basingstoke, as the site for a new lunatic asylum. Mr. George T. Hine, of Parliament-street, Westminster, has been selected as architect for the proposed asylum, and will be paid 5 per cent. on the cost of all work carried out under his direction, and his travelling expenses. At the same meeting it was decided to increase the allowance for clerical assistance to Mr. W. J. Taylor, the county surveyor, from £120 to £180 a year.

The county council of Kesteven, Lincolnshire, received and accepted at their meeting on Friday the resignation by Mr. Herbert Kirk, of Sleaford, of the offices of county surveyor and inspector of main roads.

At Wigan a technical college is about to be built in Library-street from plans by Messrs. Briggs and Wolstenholme, of Liverpool and Blackburn, recently selected in competition. The style is English Renaissance, freely treated, and the estimated outlay is about £40,000.

Funds are being raised in Leeds for the erection of a new hospital for women, and the devotion of the existing building exclusively to the treatment of children. The adopted plans for the new buildings, which have been prepared by Messrs. Chorley and Connon, Park-row, Leeds, comprise an out-patients' department, a hospital for women, and a maternity department. The estimated cost of the entire scheme is about £40,000, and of the section now to be built £23,000.

Herr Ernest Dirksen, the builder of the Berlin City and Circular Railway, and one of the ablest railway engineers in Germany, died at Erfurt on Saturday at the age of sixty-seven.

The collection of pictures bequeathed to the Art Gallery at Wolverhampton by the late Mr. Paul Lutz has now found a place on the walls of that institution. Altogether there are over thirty works, and they include fine examples of the styles of Alfred Vickers, George Morland, Old Crome, Sydney Cooper, E. le Poittevin, Edward Frere, Thomas Barker, William Collins, William Muller, Thomas Creswick, David Cox, J. P. Pyne, Landseer, F. Goodall, and Mark Anthony.

## TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 832, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

## NOTICE.

Bound copies of Vol. LXXV. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXI., XXXII., XXXIII., XXXIV., XXXIX., XL., XLIV., XLV., XLVI., XLIX., LI., LIV., LV., LIX., LX., LXI., LXII., LXIV., LXV., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., and LXXV., may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

## TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 80c. gold). To France or Belgium, £1 6s. 0d. (or 3fr. 90c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

## ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 6s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

## SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

RECEIVED.—M. M. O.—T. P.—J. W. and Co.—G. T. K.—B. W. S. Co.—L. F. N. (Bristol).—H. S.

## Correspondence.

## THE R.I.B.A. COUNCIL ELECTION AND LADY ARCHITECTS.

To the Editor of the BUILDING NEWS.

SIR,—A type-written circular has just come to me from a Fellow of the Institute soliciting my vote to help him get a seat on the Council. He says:—

I believe the admission of females as members of the Institute a mistake, and, as the Charter is not clear on this point, I should advise that the Charter be altered, or a new by-law made prohibiting their election.

Some poor fellows are very sad over the election of Miss Charles as an Associate of the Institute; but the majority are glad to welcome the admission of a lady who has shown her fitness by passing successfully all three examinations qualifying for Associateship, and thereby fulfilling all the requirements of the Charter, notwithstanding the unwarrantable insinuation as to want of clearness in the circular quoted.

When there are names to strike out, it is, to me, always a difficult matter; but the name appended to this circular will go out with a good firm stroke, and I hope that all who have received a copy of this ungallant circular will strike out the name of the candidate who would selfishly prevent persons from occupying positions to which they are fully entitled.

Let this candidate and others like him set himself and themselves to work to purify the "profession" of such evils as they may find rooted within it, and they will get all the help I can give; but do not let them, by their selfishness, exclude an element which will not only tend to

refine, but also to make honest, the practice of the art which some of us still love.—I am, &c.,  
ROBERT WILLIAMS.

## THE "R.I.B.A."

SIR,—In the very unsatisfactory "Report" brought up at the last meeting of the Institute reference is made to a "revised" scale of charges. I have not seen this revised scale, nor is it of much use, as the old scale is useless, being merely a "suggestion" for charges, drawn up by the Institute, and is (like most of the suggestions emanating from the Institute), not recognised either by judges or courts of law. Nothing has been approved by any Secretary of State, nor sanctioned by the Crown, its terms cannot be enforced unless it forms the basis of an agreement between an architect and his client, and such an agreement does not need the aid of the Institute's "suggestions."

The chairman of the meeting also stated that it was "public knowledge" who were the six architects selected by the Council to compete for the rebuilding of the Old Bailey. I have not yet seen their names published in the professional prints; nor do I think it is quite a blessing to the ordinary members of the profession that the Council of the Institute should have the power to select competitors for public works, as it means the shutting-out of all but well-known (but not necessarily therefore able) men. Doubtless the fortunate six (whose names, even, I am unacquainted with) are well known to most of the members of the Council.

It is unfortunate for the profession generally that our Institute carries so little weight with the public and the authorities, and is so wanting in backbone; but until we have Registration we shall be, and deserve to be, snubbed accordingly.—I am, &c.,  
HORACE T. BONNER.

## A PLEA FOR MORE HANDRAILS.

SIR,—Having recently met with a severe accident, by falling down the steps in front of the Borough-road Free Library, I am desirous of calling the attention of architects to the advisability of introducing handrails wherever there are flights of steps or stairs, more frequently than appears to be customary at the present time. Such a provision need not be a disfigurement, nor mar the effect of any decorative surroundings, for while, on the score of efficiency, the rail itself should be always plain and somewhat prominent, it may be mounted in a way that should be well in keeping, both in form and colour, with the other portions of the work. Another matter may here be mentioned in the same connection—that is, that there should be a distinctly marked frontal line at the edge of every step, and where possible a harder material than the step itself. A more general introduction of such items would greatly contribute to the public safety, and would prove of exceptional service to the weak-sighted and feeble-footed, the former of which I am sorry to believe are fast increasing amongst us.—I am, &c. E. C.

## HIGH ALTAR AND SCREEN, WINCHESTER CATHEDRAL.

SIR,—Of course, one knows the cry: "The king is dead—long live the king!" but, is it not a trifle hard upon others—especially upon one who has passed away—to give the credit of the restoration of this famous screen, of which you render so admirable an illustration in the current issue, to Mr. G. F. Bodley, A.R.A.? Admirable as that accomplished artist's actual work in the immediate centre of the screen undoubtedly is, it should not be forgotten that the greater part of the general renovation was carried out under others, especially by the late Mr. J. D. Sedding, whose splendid drawing of what he had already done, and suggestive of that which remained to do, many readers will remember was exhibited in the Royal Academy in A.D. 1891. The statues that now so beautifully adorn the western face of this screen were, in the main, carried out under the direction of Mr. Charles Alban Buckler, the architect; whilst Mr. G. H. Kitchen, architect, is responsible for other goodly work, thereupon executed under his personal supervision, and from his working drawings.

My old friend, Mr. Richard Boulton, in a measure, shared the honour of executing the large statues with Mr. Tom Nicholls, of Lambeth, who modelled and carved the four central and most prominent ones. Mr. E. Onslow Ford, A.R.A.,

was also intrusted with some of the figure work; but his models, according to Dean Kitchin's report, dated February 13th, 1891, were paid for and then rejected.

Winchester lays claim to possess the finest of the four great screens of this class erected in the 15th century; but this boast can never be maintained before impartial judgment. The general scheme of St. Alban's and Winchester are both practically the same. The former is reared in English stone-clunch from the Tottenhoe quarries in Hertfordshire; the latter in Caen from Normandy. Our own English clunch is capable of much more delicate manipulation than is Caen stone. This was undoubtedly known to the 15th-century carvers, and with the result that the exquisite old detail at St. Alban's is, without a doubt, a long way superior to any at Winchester.

The apathy and ignorance of the ordinary run of good people in things architectural is strikingly illustrated by a notice I saw a few days ago in an artistic stationer's shop in High-street, Winchester. In the window is exhibited a large photograph of the screen in its restored condition, and under it is written:

"THE NEW (!) HIGH ALTAR SCREEN IN THE CATHEDRAL."

Whatever would good old Cardinal Beaufort (Bishop of Winchester A.D. 1404-47) say to such a notice of his work if he could rise from the grave he has occupied for the last five or six hundred years?—I am, &c.,  
Exeter, May 12. HARRY HEMS.

## THE VIAGRAPH.

SIR,—In your issue of 5th inst, referring to my remarks at Surveyors' exhibition meeting, I observe your reporter describes me, or makes me describe myself, as a "coach proprietor," which is quite wide of the truth. I am not in any commercial undertaking. I said I was interested in motor-cars, and therefore wanted better roads here. I owned a Serpollet, which I sold, and am building a novel form of electric car, which had a preliminary trial yesterday and promises well.

I do not own even a private coach—merely a waggone, &c., and a horse or two.

If you think it worth while to correct this, please do so.—I am, &c.,  
Longhurst, Dunmurry, Belfast. J. BROWN.

## Intercommunication.

## QUESTIONS.

[12239.]—Pitches of Roofs.—Why are the pitches of roofs shown so flat in textbooks? I observe in Newland's "Carpenter's and Joiner's Assistant" that most of the wide-span roofs are about one-fourth pitch, some even as flat as one-fifth pitch. In Mitchell's excellent work, the wide-span roofs are shown about one-quarter pitch, and many under one-third pitch, and in all cases they are, I believe, intended to be covered with slates. As in both the books mentioned it is stated that roofs should not be less than one-third pitch, why are they illustrated as flatter pitches, when such details are likely to mislead students?—EXCALIBUR.

[12240.]—Modern Hotels.—If any of your readers could recommend any books on modern hotel planning, &c., the undersigned would be greatly obliged.—UTILITY.

## CHIPS.

Tamworth Castle and grounds will be formally dedicated to the townsfolk of that borough on Monday, having been purchased of the Marquis of Townshend as a Jubilee Memorial for £3,000. Another £1,000 is being expended in renovations to the building, and in laying out the gardens, some three acres in extent.

The Local Government Board has given its sanction to the proposal of the Manchester Corporation for the compulsory purchase, if necessary, of 213 acres of land at Carrington and Flixton, under the Lands Clauses Act, for treatment of sewage and sewage effluent.

Thomas Wade Foxcroft, a J.P. for Manchester, now residing at Valentine House, Rochdale-road, Blackley, Manchester, but previously at Castle House, Hill-lane, Blackley, and carrying on business as an estate agent at 14, Fountain-street, Manchester, attended at the Bankruptcy Court in that city for the purpose of being examined by the Official Receiver as to the causes of his bankruptcy. The statement of affairs showed gross liabilities £8,481 10s., of which as to £5,277 0s. 8d. the creditors were fully secured, so that only a sum of £3,067 was expected to rank for dividend. The assets were estimated at £1,483 9s. 4d., leaving a deficiency of £1,583 18s. 1d. to be accounted for.

## PROFESSIONAL AND TRADE SOCIETIES.

**DEVON AND EXETER ARCHITECTURAL SOCIETY.**—The annual meeting of this society was held at the Princess-square School of Art, Plymouth, recently, under the presidency of Mr. James Crocker, F.R.I.B.A., of Exeter. The annual report was presented by the hon. secretary, Mr. Harbottle Reed. It stated that the list of membership had slightly increased, and now stood as follows:—Members, 45; associate members, 9; associates, 13; honorary members, 4—total, 71, as against a total of 68 in 1898. The Architects' Registration Bill and the attitude of the society in relation thereto had been a source of considerable correspondence. The council had had before them the administration of building by-laws in rural districts; also communications from the Birmingham Architectural Society with regard to building by-laws and their administration, as well as the new building by-laws for Exeter. On Sept. 10 an excursion was made to Launceston by invitation of the ex-president, Mr. James Hine. It is proposed to make an excursion to Windsor in June. The prize offered by the society for the best sheet of measured drawings had been awarded to the only competitor, H. E. Roskrug, of Devonport. The balance in hand amounted to £8 14s. 11d. Perhaps the boldest action of the year was the deputation from the Society of Architects to the Lord Chancellor requesting him to consider the present state of the law upon questions of light and air. Of course, the proposal made, if it became law, would prevent a perfect shower of fees entering the pockets of a very deserving body of men; but those who had been much mixed up in this question could readily agree as to the immense blessing the appointment of a Commission would be in all such cases. After referring to the question of architectural education, he proceeded to express approval of the Architects' Registration Bill now before Parliament. Mr. Crocker was accorded a hearty vote of thanks on the motion of Mr. C. Cole, who indorsed the remarks upon the Architects' Registration Bill. Mr. James Hine seconded the vote, which was supported by Mr. Kitchell. On the proposal of Mr. O. Ralling, seconded by Mr. H. G. Luff, Mr. C. King, of Plymouth, was elected President for the ensuing year. Mr. C. J. Tait, A.R.I.B.A., was elected Vice-President, on the proposal of Mr. B. Priestley Shires, seconded by Mr. W. W. Dwelly, and Messrs. H. G. Luff, A.R.I.B.A., J. E. Harvey, and J. M. Pinn were elected members of the council. In proposing the re-election of the hon. secretary (Mr. Harbottle Reed), Mr. Crocker said a vote of thanks was due to him. This was seconded by Mr. King, and supported by Mr. Cole. A similar compliment was paid to the hon. treasurer, Mr. O. Ralling, and the branch secretary, Mr. P. B. Shires.

**NORTHERN ARCHITECTURAL ASSOCIATION.**—On Saturday, about thirty members of this association visited North and South Shields, and viewed the various buildings recently erected or still in progress. They first inspected to the new Coach Lane Schools, North Shields, erected from the designs of Messrs. Marshall and Dick, where Mr. Charles Marshall explained the various features worthy of note. The party then proceeded by the ferry to the New Empire Theatre in King-street, South Shields, under the guidance of Mr. W. Milburn (of Messrs. W. and T. R. Milburn, who, with Mr. F. Matcham, of London, designed the building), they inspected the interior of this theatre. After noticing, in passing, the new Britannia Hotel in Westoe-lane, erected from the designs of Mr. J. W. Donald, of South Shields, the members proceeded to the Ingham Infirmary, where Mr. H. Grieves conducted them over the new wing, designed by him, and now approaching completion. The visitors next arrived at Mortimer Road Schools, where the infant school, designed by Mr. J. W. Donald, was gone over, the object of interest being the Plenum system adopted for securing a supply of fresh air in the various rooms. This was demonstrated, in the absence of the architect, by Mr. A. P. Tregelles.

In St. Mary's Hall, Coventry, on Friday, Mr. R. D. Sweeting, barrister, held an inquiry on behalf of the Local Government Board, into an application made by the Coventry Corporation for permission to borrow £5,888. Of this amount £5,000 was sought to carry out alterations and extensions at the City Hospital, and £888 for the purchase of land for City Hospital purposes.

## LEGAL INTELLIGENCE.

**A PLYMOUTH ARBITRATION.**—An inquiry has been held at the Westminster Palace Hotel, before Mr. J. W. Penford, architect, sitting as umpire, to assess the value of a freehold property, situated in Westwell-street, Plymouth, known as St. Andrew's Hall, and covering a superficial area of between 7,800ft. and 7,900ft., which is required for the enlargement of the Plymouth Post-office. The property was valued by Mr. Eimond F. B. Fuller (Fuller and Fuller), of London, at £2 1s. 3d. per foot, which, with 10 per cent. added for compulsory sale, and £2,000 beyond for severance damage, brought his total estimate of the compensation to £19,937. Mr. Squarey, of Salisbury, valued at £20,408; Mr. Corderoy and Mr. Body, of Plymouth, at about £23,000; Mr. Walter Emden, P.S.A., L.C.C., of London, also at about £23,000; and Mr. Eve, of London, at a similar figure to Mr. Fuller. On the other hand, the estimate of Mr. Ryde, of London, amounted to £9,538; Mr. Daniel Watney's to £10,296; and that of Mr. Drew, of Exeter, to £10,825. The umpire reserved his award.

**A "PUBLIC" BUILDING.**—The Guardians of St. Leonard's, Shoreditch, appeared at the North London Police-court last week, by Mr. Glen, to answer a summons taken out by Mr. Meeson, one of the district surveyors for Hackney, for using a public building which was not constructed in accordance with his requirements. Mr. Milner Judson explained that the guardians had taken a large private house in the Clapton-road for the accommodation of about thirty workhouse children and three attendants. Certain alterations were made, but Mr. Meeson held that the building, being put to this use, became a public building, and he insisted that a separate staircase should be provided in case of fire. The guardians replied that the new premises were opened under an order of the Local Government Board, and that the children would simply sleep there. The question for the magistrate to decide was whether this was a public building or not. Mr. Meeson was of opinion that it came within the definition of the Act, "Schools, workhouses, or buildings used for any other public purpose," and that it should have full protection in the case of fire. Mr. Glen, while admitting the facts, contended that the section of the Act did not apply to this case. The magistrate might be asked to hold that every cottage in which a pauper child was boarded out was a public building. Mr. Fordham said he felt bound to hold that this building was a workhouse or an extension of the workhouse. He therefore had to find that the building was a public one, and used as such without the consent of the district surveyor. He imposed a fine of 1s. As it was a case of one public body against another, he should not grant costs.

**ARCHITECT'S CERTIFICATE FOR DELAY.**—DOULTON AND CO. V. NEW BRIGHTON TOWER AND RECREATION COMPANY, LIMITED.—This action, heard at Liverpool recently, by Mr. Justice Bigham and a special jury, was entered as defendant's counterclaim for damages for delay. Counsel for the defendants stated that the claim by the plaintiff firm was for £400, due for terracotta supplied to the New Brighton Tower on the certificate of the architect, and judgment had been obtained upon that claim. That left a balance, not disputed by the defendants, on the contract of £200. The claim was admitted by the Tower Company, subject to a counterclaim for delay in the delivery of the terracotta at the rate of £10 per week. That amounted to £660, and it was certified by the architect. Evidence was given and counsel were heard as to what damage the Tower Company had sustained by the delay in delivery, and on what basis the architect granted his certificate for the payment of penalties. Mr. Shee, on behalf of Messrs. Doulton, argued that, according to the contract, the certificate had to be the architect's own certificate, whereas it was not given until the architect had consulted counsel on the construction of the penalty clause of the contract, and therefore the certificate was not the certificate of the architect. Prior to the consultation with counsel the architect had drawn up a certificate for £200 odd, which he believed was the fair amount of damage sustained. Mr. Greer suggested that the architect should be allowed to make an amended certificate. Mr. Pickford argued that the certificate had been made by the architect upon his reading of the contract. His Lordship remarked that if he came to the conclusion that the architect made a certificate on a mistaken view of the legal aspect of the contract, he would consider whether it would not be a proper thing to send the certificate back to the architect for amendment. He would reserve his judgment.

**A BRIXTON ARBITRATION.**—A disputed case of value of two freehold houses standing upon an acre of land in Acre-lane, Brixton, possessing a frontage of 100ft., and a depth of 570ft., came before Mr. Under-Sheriff Burchell and a special jury. For the claimant, Messrs. Fuller and Fuller valued the property at £9,817, Messrs. Fox and Bousfield at £10,237, and Messrs. Farebrother, Ellis, and Co. at £10,337. For the School

Board defendants, Mr. G. A. Wilkinson estimated the value at £4,118, Mr. Burnett at £4,125, Mr. Stimson at £4,000, and Mr. Harrington at £4,125. The jury assessed the value at £8,450. The School Board had made an offer under seal of £4,400, and therefore the costs of both sides fall on them.

**A LIVERPOOL ARBITRATION.**—The award of the arbitration in regard to the acquisition of the George's Dock by the Liverpool Corporation has been delivered by Mr. Vigors, the arbitrator. He has ruled that the Corporation must pay the Dock Board the sum of £270,000. The Corporation will fill up the dock and undertake various works which will improve the approaches to the river. The Mersey Dock and Harbour Board will retain a portion of the site, upon which it is proposed to erect new offices for conducting the increasing business associated with the trust. The whole of the dock will be filled up, preparations for doing so having been already begun. The scheme of the Corporation is to continue Water-street, Brunswick-street, and James-street direct to the Pierhead, and to utilise the land not required for thoroughfares for public baths and other buildings. The total of the award is £305,224, divided into two amounts, one of £278,254 and the other of £26,970, the arbitrator having given his award separately in regard to two portions of the estate. The costs of the arbitration amounted to £1,089.

**UNLICENSED WOOD STRUCTURES.**—John Mountain, of Fiera-road, East Dulwich, was summoned to Lambeth Police-court on Monday for setting up a wooden structure without having obtained a license from the London County Council. Mr. Thomas Chilvers, from the Solicitors' Department of the Council, appeared in support of the summons, and the defendant was represented by Mr. Eldridge. Mr. W. G. Perkins, an architect and surveyor in the office of the Council, stated that he went to Queen's-yard, at the rear of Queen's-road, Peckham, and found a wooden structure 47ft. long and about 25ft. in height, forming an advertisement hoarding. It was attached to the front of a two-story stable, and was let out to an advertising contractor, the defendant being the owner of the premises. An application had since been made to the Council by the defendant's architect for leave to retain the structure, but the application had been refused. The hoarding was still up. Mr. Eldridge submitted that this was not a structure within the meaning of the London Building Act; but Mr. Hopkins said it was clearly within the section. Mr. Eldridge said the builder who put up the structure advised the defendant that he would be within his rights in erecting it. Mr. Hopkins made an order requiring the defendant to take down the structure within 21 days, and also directed him to pay a nominal penalty of 2s. and £2 2s. costs.

## CHIPS.

A theatre is to be built opposite the post-office at Huddersfield from plans by Mr. Frank Matcham.

The new Infirmary, Basingstoke, is being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The death is reported as having occurred a short time since of Mr. Thomas Kershaw, M.S.A., of the Technical School, Huddersfield. Mr. Kershaw had been a member of the Society of Architects since 1888.

Bishop Wilkinson, of St. Andrews, officiated on Saturday at the laying of the corner-stone of the new mission church of St. Roque's, Blackcroft, Dandee. The church is estimated to cost £2,000, and will accommodate 300 persons.

Mr. B. T. Batsford will shortly have ready a new book on Embroidery. It will be the combined work of Mr. Lewis F. Day, who is just completing a course of lectures on the subject at the Royal Institution, and of Miss Mary Buckle, an accomplished embroideress and teacher of the art. Its scope is practical, and it is addressed to all interested in embroidery and embroidery design. It will be fully illustrated by reproductions of needlework on a scale large enough to show the stitch, and the artistic and technical sides of the art will be treated with equal thoroughness.

The work of the York Dispensary was transferred on Thursday to new premises in Duncombe-place, which were opened by Dr. Jonathan Hutchinson, F.R.S. The premises are a continuation of the Classical style adopted when the improvement and widening of Duncombe-place were commenced. The building is a three-storied one, 43ft. in height, and with a frontage of 73ft. Mr. Kirby, F.R.I.B.A., Liverpool, prepared the plans, and the contract has been carried out by Messrs. Wm. Ballerby and Sons, York, with Mr. Thomas Rawling (York), Mr. G. Hodgson (York), and Mr. Thomas (York) as sub-contractors for brickwork, plumbing, and painting respectively.

## Our Office Table.

A MEMORIAL, signed by over twenty well-known architects, has been presented to the Dean and Chapter of St. Paul's, protesting against the continuance of the works of decoration until full opportunity has been given for the consideration of the whole scheme by the best expert opinion available. The memorialists urge that Sir W. Richmond's scheme, whatever its abstract merits, has not been thought out in sympathy with and in subordination to the architecture of the cathedral. They point out that the chief inspiration of Sir W. Richmond's design has been sought in Byzantine art, with certain motives suggested by English designers of this century, that, in their judgment, a fatal injury is being done to the proportions of St. Paul's by this substitution of Sir W. Richmond's scale for the scale of Sir Christopher Wren, while the decorations now being carried out involve actual injury to the stonework of the cathedral as left by Wren. Sir W. Richmond has indeed, they declare, stultified the architect's design, and in nearly every detail of his decoration he has shown the same indifference to the clear intention of the architecture. The protest is signed by John Belcher, John F. Bentley, Reginald Blomfield, J. M. Brydon, James Brooks, Basil Champneys, T. E. Colcutt, Alexander Graham, M. E. Macartney, E. W. Mountford, W. C. Marshall, E. Newton, F. C. Penrose, Beresford Pite, E. S. Prior, E. R. Robson, J. Oldrid Scott, J. J. Stevenson, Leonard Stokes, E. P. Warren, Thomas H. Watson, H. Wilson, and R. Seldon Wornum.

At Tuesday's meeting of the London County Council, the Housing of the Working Classes Committee reported that the Council was now proceeding with the erection of dwellings on the Millbank estate. The estate was laid out so that 17 blocks of dwellings might be erected, and these dwellings would provide accommodation for about 4,300 persons. The average size of the living-rooms was 141sq. ft., and of the bedrooms 102sq. ft. It was recommended that the estimates of £47,120 and £28,500, submitted by the Finance Committee, be approved, and that the tender of Messrs. Holloway Brothers be accepted. The proposal of the Parks Committee for the demolition of the Tudor house at Bromley-by-Bow was, after a long discussion, referred back to the committee by 65 to 31 votes. It was agreed to contribute £3,000 towards the cost of the acquisition of the Dollis Hill estate by the Willesden District Council for the purposes of a public park.

The question as to whether contracts for the repairs of roads and other work should be given to contractors as heretofore by the grand jury or the workmen should be employed direct without the intervention of a contractor engaged the attention of the Limerick Council at its last sitting. Lord Emly moved a resolution to the latter effect, and the proposition was seconded by Mr. Coleman, representing the Croom Division. Lord Dunraven said he strongly objected to the direct employment of labour, as it would be impossible for the council to look after the business if they employed labour directly. He sympathised with the motion and should like to see the labourer's position improved; but he objected to the principle that the grand jury should become direct employers. Mr. Leahy, solicitor, advised the council that the Act specified that work should be done by contract, save where in charge of the county surveyor. The resolution was eventually defeated by 21 votes to nine.

### MEETINGS FOR THE ENSUING WEEK.

THURSDAY.—Society of Architects. "Some Essex Churches," with lantern illustrations, by G. Gard-Pye, M.S.A., St. James's Hall, Piccadilly. 8 p.m.

Carpenters' Hall Free Lectures. "Staircases," by James Bartlett, M.S.A. 8 p.m.

The death is announced from Liverpool of Mr. Beacon Hill, who for the past 22 years had been one of the district building inspectors, and for some years previously was engaged as a draughtsman in the borough engineer's office.

A new Baptist chapel in Thomas-street, Aston, Birmingham, was opened on Friday. It is of red brick with white stone facings, measures 65ft. by 40ft., and is seated for 500 persons, including 100 in gallery. The cost has been £1,750.

## Trade News.

### WAGES MOVEMENTS.

THE DISPUTE.—Yesterday practically decided whether we are to see an early settlement of the dispute between the Master Builders and the Plasterers' Association, or whether the conflict is to involve the whole of the building trades. A fortnight ago the National Association of Master Builders met at Birmingham, and resolved to ask the unions in the building trades to repudiate all sympathy with the plasterers, or to run the risk of a lock-out. The unions practically all declined to comply. These replies were considered by a special meeting of the National Association of Master Builders in Birmingham yesterday, when the future policy of the employers in the present dispute was determined upon—too late for the result to reach us before going to press. The employers may have resolved to continue the struggle on its present lines. They may put into execution their suggestion of a general lock-out. They may decide to have a general conference with all the trades. Or they may express themselves as agreeable to a conference with the plasterers alone, for the purpose of trying to effect an immediate settlement. We hardly think they will adopt the first alternative, and we sincerely trust they will not take the second. We hope that a conference will be decided upon, and think a conference with the Plasterers' Association alone will be the speediest way to a satisfactory settlement. If yesterday's meeting expressed itself agreeable to a conference with the plasterers, there is a very substantial prospect of an immediate settlement being effected on the lines we have elsewhere indicated.

THE SKILLED LABOUR MARKET.—The memorandum prepared by the Labour Department states that in all the important industries a further improvement in the state of employment has taken place during April, with the result that the percentage of unemployed members of trade unions is lower than that recorded in any month since June, 1890. In the 123 trade unions making returns with an aggregate membership of 495,496, 10,866 (or 2.2 per cent.) were reported as unemployed at the end of April, compared with 2.5 per cent. a month before, and 2.9 per cent. in the 116 unions, with a membership of 466,213, from which returns were received for April, 1898. Employment in the building trades has continued good, though the plasterers' dispute remains unsettled. The percentage of unemployed union members among carpenters and plumbers at the end of April was 1.3, compared with 1.6 in March. The percentage for April, 1898, was 1.1.

CHELTEMHAM.—Through the intervention of the mayor (Alderman Norman), an end has been put to the carpenters' strike, which had lasted a fortnight. The men claimed an advance of 1d. an hour—viz., from 7d. to 8d. They have now agreed to accept, and the masters have agreed to concede, ½d. an hour advance from this date till January 1, 1900, with a further advance of ½d. from that date.

NATIONAL ASSOCIATION OF MASTER HOUSE-PAINTERS.—A special meeting of this association took place on Friday at Leeds. The chair was occupied by the president, Mr. J. C. M. Vaughan, Hereford. A deputation representing the Master Builders' Federation waited upon the association, and explained the position of matters connected with the building trades, and a suggestion was made that the National Association of Master House-Painters should join the Federation. After discussion, a resolution expressing sympathy with the aims of the Master Builders' Federation was adopted. The question of joining the Federation was also considered, and the matter was referred to a committee. The next meeting of the association will be held at Birmingham in September.

WIGAN.—The Wigan painters and decorators returned to work on Friday, pending the arbitrator's decision on the questions in dispute. The men had been on strike a short time owing to the masters' refusal to concede the advance of wages and come to a better understanding regarding apprentices. The parties have now agreed to abide by the decision of Mr. Robert Stone, Newton-le-Willows, or, if he is unwilling to act, of Judge Jones.

WOLVERHAMPTON.—The master builders of Wolverhampton have refused to accede to the demands of the plumbers for an advance of ½d. per hour.

Mr. A. W. Soames, M.P., is in charge of a memorial from members of Parliament to the Dean and Chapter of St. Paul's Cathedral for an inquiry of experts into the alleged "decorative destruction" of the Cathedral. The memorial is being readily signed by M.P.'s, and the signatures have been obtained of Sir Henry Campbell-Bannerman, Mr. Asquith, Mr. Lecky, Sir Cuthbert Quilter, Sir Thomas Sutherland, and Sir Walter Foster, amongst many others.

Edenfield—Church .....	Council .....	R. Walton, Hawthorn House, Edenfield .....	" 25
Warrington—Fire-Engine House .....		Thomas Longdin, Borough Surveyor, Town Hall, Warrington .....	" 27
Wingate—Primitive Methodist Church and Schools .....	Kingsdon-upon-Hull School Board ..	Thos. Greenwell, Front-street, Wingate .....	" 27
Hull—Eleven Schools .....	Guardians .....	D. Jno. O'Donoghue, Clerk, School Board Offices, Albion-st., Hull.	" 30
Barnet—Workhouse and Infirmary .....	Berks and Bucks County Councils ..	The Master, Workhouse, Barnet .....	" 30
Heywood—Technical School .....		W. H. Meadowcroft, Town Clerk's Offices, Mun. Bldgs, Heywood.	" 30
Datchet—Iron Bridge spanning the Thames .....		Joseph Morris, County Surveyor, Reading .....	" 30
Exmouth—Public Lamps, Shelter Seats, and Public Seats (Three Years) .....	Urban District Council .....	W. G. Harding, Surveyor, Exmouth .....	" 31
Richmond, Surrey—Workmen's Dwellings, Manor-grove .....	Town Council .....	The Borough Surveyor, Town Hall, Richmond, Surrey .....	" 31
Southall—Schools .....	St. Marylebone Guardians .....	H. T. Dudman, Clerk, Northumberland-st., Marylebone-road, W. ....	June 5
Macclesfield—Two Gasholders at Tytherington .....	Gas Committee .....	J. Newbigging, Engineer, Town Hall, Macclesfield .....	" 27
Seascale—Pavilion and Caddie Shelter .....	Golf Club .....	H. Braithwaite, Hon. Secretary, Seascale .....	—

## PLUMBING AND GLAZING.

Bedminster—Luckwell School .....	Bristol School Board .....	H. C. M. Hirst, A.R.I.B.A., 30, Broad-street, Bristol .....	May 29
Bristol—Wells-road School, Knowle .....	School Board .....	H. Dare Bryan, 28, College-green, Bristol .....	" 29

## ROADS AND STREETS.

Annan—Paving Streetway (6,000 yards) with Granite Cubes ...	Commissioners .....	Murray Little, Clerk, Annan .....	May 20
Londonderry—New Street off Creggan-road .....	W. Baldrick .....	R. E. Buchanan, Architect, 33, Shipquay-street, Londonderry ..	" 20
Annan—Footpath at Cemetery .....	Parish Council .....	John Laurie, Clerk, Parish Council Office, Annan .....	" 20
Bolton—Widening Chorley Old-road .....	Town Council .....	The Borough Surveyor, Town Hall, Bolton .....	" 23
Enniskillen—Road Approach, Inismore Viaduct, Co. Fermanagh ..	Urban District Council .....	The County Surveyor, Enniskillen .....	" 24
Pokesdown—Making-up Roads .....	St. John's Vestry .....	The Clerk, Council Offices, Cromwell-road, Pokesdown .....	" 25
Kilburn—Wood Paving .....	Town Council .....	Arthur P. Johnson, Vestry Clerk, Vestry Hall, Hampstead .....	" 25
Bolton—Street Works .....	Rural District Council .....	W. Marsden, Private Works Surveyor, Town Hall, Bolton .....	" 25
Ardee—Road Maintenance (One Year) .....	Urban District Council .....	Thomas B. Dromgoole, Clerk, Board-room, Workhouse, Ardee .....	" 29
Barnet—Making-up Sebright, Fuller, and Calvert Roads .....	Corporation .....	W. H. Mansbridge, Surveyor, 40, High-street, Barnet .....	" 30
Kingston-upon-Thames—Tar-Paved Footpaths (6,000sq. yds.) ..	Urban District Council .....	H. A. Winsor, Town Clerk, Clattern House, Kingston-upon-Thames	" 31
Hertford—Road Repair (Nine Months) .....	Urban District Council .....	J. W. Riggs, Highway Surveyor, Fanshawe-street, Hertford .....	" 31
Wimborne—Road Works .....	Urban District Council .....	C. Munceton, Surveyor, Council Offices, Wimborne .....	June 5
Tottenham—Repairing Tar and Asphalt Paving .....	Urban District Council .....	F. E. Murphy, Engineer, 712, High-road, Tottenham .....	" 6
Kettering—Completion of Twenty-Two Private Streets .....	Urban District Council .....	Thos. R. Smith, Surveyor, Market Hill, Kettering .....	" 7
Cardiff—Kerbing Footways on Main Roads .....	Glamorgan County Council .....	The County Surveyor's Office, Town Hall, Bridgend .....	" 7

## SANITARY.

Longford, Gloucester—Pipe Sewers (3,000 yards) .....	Rural District Council .....	J. Fletcher Trew, County Chambers, Gloucester .....	May 20
Plymouth—Stoneware Pipe Sewer .....	Corporation .....	James Paton, Borough Engineer and Surveyor, Plymouth .....	" 22
Port Glasgow—Main Sewer, Bellhaven-street and Brown-street ..	Commissioners .....	James Murray, Borough Surveyor, Town Buildings, Port Glasgow	" 22
Rochdale—Drainage at Workhouse .....	Guardians .....	R. A. Leach, Clerk, Union Offices, Townhead .....	" 23
Forlock and Lucombe—Sewers .....	Williton Rural District Council .....	F. H. Anson, 15, Dean's-yard, Westminster, S.W. ....	" 23
Lamesley—Sewers for the Village of Bewick Main .....	Chester-le-Street R.D.C. ....	John H. Mole, Surveyor, Birtley, Chester-le-Street .....	" 24
Hampstead, N.W.—Flushing Tanks .....	St. John's Vestry .....	Arthur P. Johnson, Vestry Clerk, Vestry Hall, Hampstead .....	" 25
Sutton Coldfield—Sewer .....	Corporation .....	W. A. H. Clarry, Borough Engineer, Town Hall, Sutton Coldfield ..	" 25
Lytham—Sewer .....	Urban District Council .....	Henry Bancroft, M.I.C.E., 88, Mosley-street, Manchester .....	" 25
Salcombe Regis—Sewerage Works .....	Honiton Rural District Council .....	Edward G. Warren, Surveyor, Commercial Chambers, Exeter .....	" 26
St. Anne's-on-Sea—Sewer .....	Urban District Council .....	Henry Bancroft, M.I.C.E., 88, Mosley-street, Manchester .....	" 26
Beccles—Sewering & Paving Joseph-st. & Parrin-lane at Winton	Highways Committee .....	Arthur C. Turley, Borough Surveyor, Town Hall, Eccles .....	" 29

# THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LXXVI.—No. 2316.

FRIDAY, MAY 26, 1899.

## REBUILDING AND IMPROVEMENTS.

**R**EBUILDING old premises and additions to our streets are rapidly transforming the Metropolis, not always for good from an architectural point of view, nor beneficial from a sanitary aspect. The tendency of rebuilding is to make the same area of ground accommodate a larger number of people than the old premises, either by placing two or three new houses where formerly only one house stood—a case very frequently met with in the suburbs, or by erecting the new building twice as high as the old one, often found in the rebuilding of premises in the City and West End. Both are manifest evils, for while we pull down the old and unhealthy premises for buildings more perfect in their sanitary arrangements, we undo the good by cramming more people on the same site. For a widened thoroughfare a good deal has been sacrificed; buildings have been cramped in depth and width, as in Charing Cross-road, parts of Clerkenwell, and in Fulham, and in other thickly-populated districts like Camberwell, we find large back areas and garden grounds inclosed or built over, forecourts absorbed by road or occupied by shops, side passages utilised—all to make more roomy premises. We cannot see here exactly where improvement comes in. An instance occurs to us of this mania for filling up spaces, even when they adjoin a public building, and have been left to give light or to reveal its features—we refer to an alleged agreement that has been made between the rector and churchwardens of St. Dunstan in the West, and the Law Life Assurance Society, Ltd., for the sale to the latter of the space on the west side of St. Dunstan's Church in Fleet-street. Can this act of encroachment really be contemplated? The church in question is neither an ancient edifice, nor one of which we can be proud as a specimen of Gothic; but it is, at least as far as the octagonal plan and the steeple are concerned, a feature in the street—in fact, the space on either side, by separating the tower from the adjoining premises, adds greatly to the effect of the former, which would be entirely destroyed if the spaces on either or both sides were to be filled up with buildings. In this instance also important windows of the church receive their light from the areas in question. They add immensely to the appearance of the tower by showing its return sides. We know how some of Wren's City churches have been spoiled by building up close to their towers—as, for example, St. Martin's on Ludgate Hill.

We hope that any petition for a faculty to fill up the space in question will not be entertained, as if it were granted other of our churches and public buildings which have open spaces left in front or rear for emphasising their design will be similarly sacrificed to the greed for making extension. Certainly we are surprised that any such spoliation can be seriously entertained by rectors and churchwardens who are trustees of our churches.

This is only one illustration of the "filling-up" craze which threatens to rob us of every forecourt or space at the side or rear of our buildings. The usual form it takes is to build over a back court or area, which can be done under the London Building Act if a space of 100sq.ft. be left for light and air to any habitable basement. Section 41, referring to space at rear of domestic buildings abutting upon a street, provides at the back

an open space of not less than 150sq.ft., but this open space may be provided above the level of the ceiling of the ground story or a level of 16ft. above the adjoining pavement, so that in many cases the whole area on the ground floor may be utilised by building. Again, what a little space is actually required under the Act! Only an area of the width of building and a depth of 10ft. So that it becomes too easy to fill up a large area at the rear of a building provided there is an area well for light and air provided of the size named.

Then we have the increased height of new and rebuilt premises. Limited as it is by the Building Act, we cannot avoid the reflection what some of our narrower streets will become, when even a large proportion of the number of houses are built to the height allowed. The great piles of offices and residential blocks erected at Kensington, Knightsbridge, and other parts of the West End are threatening to destroy the private houses in their neighbourhood by raising rents and creating a desire to rebuild to greater height. If we take the neighbourhood bounded by Piccadilly on the north to King-street and St. James's-square on the south, the Green Park and Regent-street on the west and east respectively, we shall find several large blocks of buildings, in progress or already finished, of this class. At the corner of Duke street and St. James's-square a large block of shops and premises is being finished by Holloway Brothers, which has in all seven stories, and is to be provided with the Otis elevator. The architectural features are plain; red bricks in the flat piers are relieved by large stone bay-windows with five-canted sides, and the corner to St. James's-square has a commodious bay window of several lights carried up to the second story, above which it is reduced in size, and surmounted by an octagon turret. The stonework details of the windows are simple and effective; the transoms are carried through and outside the mullions. The floors are of iron and concrete. The wide, flat-canted bays of stone help to relieve the flatness of the elevations, besides adding to the size and cheerfulness of the rooms. In a few years we may see other old houses in St. James's-square rebuilt as many-storied blocks, and the quiet air and aristocratic appearance of the old square will gradually disappear. Of course, there is a strong temptation to increase the tenable area of houses in expensive neighbourhoods by raising the buildings to several stories in height, and this tendency appears to be strongest in the more expensive parts, such as the West End. We can imagine the effect of a few "skyscrapers" in squares like those of St. James's, Berkeley, and Grosvenor. We have monster hotels already near some of them, and this cosmopolitan taste in building is gradually extending amongst us by the yearly arrivals of wealthy American families. How to preserve the compactness and sobriety of our residential architecture amidst all this speculative activity is not very easy. Sudden jumps in the skylines of all our main thoroughfares are ominous of what we are to expect, when all we value in those qualities which make architecture are threatened, when rental value and all that it implies will usurp the first place, and the individual monopolist or syndicate will assert authority over every artistic consideration.

## PICTURES AT THE ROYAL ACADEMY.—IV.

**T**HE large subject picture "Laus Deo," by Solomon J. Solomon, in Gallery VI., is the chief composition, and is conspicuously hung as a centre piece. The knight clad in full armour, and his fair lady, with an aureola round her head, who is crossing the brook on his steed, is a design of much

beauty and power, and displays a decorative motive and treatment. Beyond the brook, in the glade of a forest, are discerned figures. The drawing and modelling of the horse and rider are bold, there is majesty in the triumphant step and the wing-like radiance behind the fair lady who is behind.

Alfred Parsons' large landscape "Village by the Links" (434), with its red sunset and stormy sky, under the semi-gloom of which a few people are playing golf, is one of the most successful landscapes of the year. There is breadth and vigour displayed in this thoroughly English landscape, which represents Holme Church, near Hunstanton. Cecil R. Burnett's full-length standing figure of a lady (443) is well modelled, and graceful in pose.

John S. Sargent's portrait of Lady Faudel Phillips—a presentation portrait—is one of this painter's successes; we may compare it to his other remarkable portrait of Miss Octavia Hill for the individuality and expression he has given us in each. In the former we see the lady philanthropist, benignant but practical; in the latter the popular Lady Mayoress, with her pleasant, good-natured face lit up by a smile. The latter is dressed in black with low body, and is set off by a red background.

Charles Kerr paints feelingly a village scene in Brittany, "When Other Helpers Fail" (451), a friendless girl kneeling before a village cross. The dark, cloudy sky, which casts a sombre light over the green and its groups of peasants, is in unison with the theme, and the work is handled sympathetically.

Frank Bramley, whose subjects of fishing-village life have always an interest, paints a group of garrulous old fishermen gossiping together in the parlour of a cottage before a comfortable fire (471). The characters are cleverly portrayed, the firelight, which throws a ruddy glow over the room and its occupants, is appropriately introduced.

Near it, Ralph Peacock has a pleasing study of a little girl seated on a bank beneath a tree, called "Bunny" (476), very admirable as a study of juvenile life and character, putting us in mind of some of Millais's studies of children. The little girl, in a flowered-muslin frock, her hands clasped in her lap, has an expression of innocence and contentment. Beyond her rises the brown hilly slope of a beech forest; there are a directness and simplicity in the composition that give it a poetic charm.

John White's "The Brook and the Sea" is simple. Over the arm of the brook where it joins the sea is a rustic bridge, upon which a woman is talking to her child. There is breadth and pleasing harmony of tone.

The portrait of Mr. Gladstone in 1894, by Frederick Goodall, one of the latest of the great statesman, has a melancholy interest. Although there is a pallor in the face, and a lack of vivacity when compared with his earlier portraits, the features and individuality of the man have been fully presented.

Few pictures of any note detain us in Gallery VII. E. Blair Leighton's "Elaine" (544) is another version of a favourite legend, and depicts the "Lily Maid of Astolat" in her beautiful chariot bier, on the barge before a Norman entrance, the steps of which lead down to the river; King Arthur and his Court stand to bid farewell in the porch. Mr. Leighton depicts the scene in his usual scholarly and brilliant manner. The fair lily maid has in her hand a lily, and over her the "braided blazonings." The painter appears to have taken inspiration from Tennyson's verse:

In her right hand the lily, in her left  
The letter—all her bright hair streaming down,  
And all the coverlid was cloth of gold  
Drawn to her waist, and she herself in white,  
All but her face, and that clear-featured face  
Was lovely, for she did not seem as dead,  
But fast asleep, and lay as tho' she smiled.

The chariot bier, in white and gold, is

adorned by garlands of white flowers at the head and foot, and is of elegant design; the king and his retinue of knights and ladies, their costumes, and the enriched Norman archway are accomplished adjuncts to the one recumbent and brilliant figure.

John MacWhirter's "The Silver Strand: Loch Katrine," suggested from "The Lady of the Lake," is a beautiful piece of scenery, recalling the fairy dream of the poet, reflecting the autumnal foliage with distant blue mountains beyond. David Farquharson conjures up another dreamland called "Romantic Ground" (539), full of charm and misty light, a stream winding its way round the base of an old castle in a beautiful undulating landscape. Contrasting with these calm and peaceful scenes we come to a large canvas occupying a central position, full of tumult and the horror of a naval battle. It represents "The Battle of the Nile," by W. L. Wyllie, whose ability as a painter of marine subjects is unquestioned. Here we see all the historic battleships in deadly combat, one large vessel dismasted and helpless, and her rigging lying in a heap over her sides, another vessel on fire, sky and water red with flames and destruction. Mr. Wyllie has succeeded in giving a graphic and powerful representation of the great naval battle. We understand this picture and Mr. H. W. B. Davis's landscape, "Approaching Night," have been purchased under the terms of the Chantrey bequest for the Tate Gallery.

A powerfully painted interior in warm glowing red tones is Gonzalo Bilbao's "Baile de los Seises"—dance of the choristers in the Cathedral of Seville. This curious old Spanish ceremony of semi-religious meaning is depicted with much animation and ability. Before a brilliantly lighted high altar, raised by a flight of steps above the level of the choir, the choristers, in scarlet cassocks and white cottas, are dancing to the music of the choir. Round it sit dignitaries in their robes; boys hold large lighted tapers, which throw a ruddy light over the interior. Costly fittings and accessories, huge gilt candlesticks, censers, rich metal-work, carving, and decoration form a rich setting to the function, and combine to make an imposing spectacle. The gloom irradiated by the light of hundreds of candles lend a mystic and religious air to the measured movements of choristers. The painter has shown his skill as a delineator of ecclesiastical ceremonial.

Joseph Farquharson (573) has a noble landscape, "The yellow sun declines, and with long rays and shades the landscape shines." Through a vista of trees sheep are passing, gleams of sunlight flicker through the foliage, and brightly gild the backs of the herd and the pathway below. Mr. Farquharson has given us an idyllic scene; his streams of evening light illumine the forest road and the rich summer foliage of the trees; there is a delicacy and tenderness in the handling of the intertwining foliage, and the flickering beams seem to move through the branches and on the backs of the sheep. Another attractive landscape is Yeend King's "The River and the Brook" (594). This painter of landscape is certainly improving in his colour; the cold tones of green we have before noticed in his work are not found in this instance, which shows a brook joining a river as it passes a village. There are atmosphere and delicate handling in the work.

We must not pass by John R. Reid's very delightful piece of rural scenery, "A Kentish Idyll" (559)—a bright country cottage study, such as the late Mr. Birket Foster loved to paint. Mr. Reid tells his tale with a directness and a sympathy that cannot fail to carry conviction. A young peasant labourer's wife is at the gate of a farmyard near the sea, her baby is being supported by her on the top of the gate, while an elder child stands on one of the rails. In a field beyond

are two men at work digging, and the sea beyond. There is a spring-like delicacy and brilliance in the foliage and landscape, and Mr. Reid's vigorous touch and sparkle of light and shadow are dominant. Alfred East's moonlight scene, "The Miller's Daughter" (606), is picturesque. The mill, surrounded by tall elms, and the quiet meadows and "sleepy pool," are cleverly managed. The girl in a punt is probably the miller's daughter.

One of the best pictures in the gallery that will draw attention is C. Napier Hemy's "Smugglers" (600), an incident of a past age, shows a boat load of smugglers being pursued. The subject has been powerfully handled by Mr. Hemy in his usual masterly way. The party of smugglers are being hotly pursued, and are opening fire on their pursuers from the stern of their vessel; they are making desperate efforts against a heavy sea to get away. The drawing of the boat, half-swamped, and the sturdy crew within it are vigorous, full of animation and movement, and the work is worthy of this accomplished sea and boat painter.

Another popular incident is painted by Fred. Roe (601), representing "Joan of Arc, 1429," leaving a fortress clad in white armour on her black charger. The young and gallant peasant girl is represented turning her face to the people, and asking them to pray to God for her success. It is this incident, recorded in a contemporary letter by Count de Laval in Lord R. Gower's "Life of Joan of Arc," that Mr. Roe has painted with much success. Herbert J. Draper has a large and cleverly painted subject, "Ferdinand and Ariel" (616), where Ariel is perched on a rock in an expansive landscape in an island, with an expanse of sea and white cliffs beyond. The composition and colour are handled with much breadth and harmony. Two other subjects are worth notice. One is J. Wimbush's "Fide et Amare feci," a monastic sculptor kneeling on a scaffold before a statue in a niche he has presumably been carving, painted with skill and reverence; and Charles Stuart's large picture, "In the Sanctuary," a very fine piece of moorland scenery, a refuge of wild deer, a rocky headland, clad with herbage. The atmosphere and the dark shadow of the rock at its extreme scarped end are skilfully managed, and reinforce the lighted side of the rock.

T. C. Gotch, whose clever, symbolically-conceived subject "The Heir to all the Ages" and other similar pictures drew attention in late exhibitions, has this year "A Pageant of Children," a procession of children, boys and girls of varying ages, led by a little boy carrying a standard, and intended to represent childhood's ideal of happiness and gaiety. The figures are arranged in pairs in order of age, the younger lead, and the elder bring up the rear. There is also a meaning suggested in the musical instruments and objects they carry. Thus, two boys are shown with trumpets, others with drums and cymbals, and the two elder girls behind, dark and fair, carry books. The costumes are harmonious and pleasing, of semi-Medieval character, and the colours of the draperies are made to contrast with the subdued colour of tapestry background. The work is, of course, painted in a decorative key of colour, and the treatment, therefore, rather flat.

"The Golden Hour" (640), by Arthur Hacker, is this versatile painter's chief picture. The scene is an umbrageous glade; through the foliage gleams of sunlight dapple the sward. A group of ladies, in evening dress, sit with musical instruments, but are for the moment rapt in ecstasy by the cadences of Eros. Mr. Hacker has painted a charming composition. The Titian-like richness of colour, and play of light and shadow are soft and harmonised.

Ernest Normand, whose work is marked

by refined drawing and colour, sends "The Legend of Pandora" in three panels (645). There is a Leightonlike execution and refined grace in the figure, the modelling is good, but the work lacks the emotional.

A fine seascape in grey tones is Fred W. Jackson's "Return from Line Fishing" (664). William Stott paints his "Hide and Seek in the Garden of Epicurus" (675) in a more solid manner than has been his wont, and this work is one of promise.

J. Aumonier's "Sheep Washing" (666) is a work of much power, beauty, and directness. David Murray is a prolific painter of Scotch landscape, and his large Scotch river scene (660) is powerful; but we almost wonder whether he can find time to paint so many subjects direct from nature.

Gallery IX. contains several very beautiful studies to which we cannot allude here. Alfred Morgan has some pleasing little pictures. L. Alma-Tadema, a portrait of Mrs. Marcus Stone. Laura T. Alma-Tadema is well represented, and there are deftly-painted works by Lexden L. Pocock (710), Spenlove-Spenlove (727), H. W. B. Davis, Stuart Lloyd, a clever work, "March in Granada," by Alfred Waterhouse, J. Henry Henshall, W. H. Margetson (809), Jessica Hayllar.

In the next gallery we have Gennaro D'Amato's large "Diamond Jubilee Service at St. Paul's Cathedral," a well-painted scene, though rather slighter in handling than the two we have noticed. We notice a few trifling differences, such as the scarlet cassocks worn by the choir, but the grouping is well managed.

"Love the Conqueror," by Byam Shaw, is, despite its eccentricity, one of the pictures of the year. We always look with interest on what this very original painter does. His clever picture "Truth," of last year, is in the remembrance of many. In this large frame he depicts a procession of great men and women of all ages who have been made captives by the "ruling passion." It is an allegory. We see in the long and winding procession Henry VIII., Shakespeare, numerous kings and queens and celebrities, who all pass by Love seated on a war-horse—a mere toy-looking figure, and of very crude drawing. There is the charm of quaintness and Mediævalism about the drawing and colour of this curious picture. Mr. Byam Shaw loves the enigma in art. His method of painting is quaint and archaic in expression, and if we do not see exactly what he sees, nor value his eccentric style, his work is nevertheless attractive.

There is little of any interest in Gallery XI. T. C. Gotch has a portrait of a lady (935) in delicate shades of fawn and rose; W. Dendy Sadler (936) has one of his amusing incidents, told with his wonted technical skill and humour, "The Plaintiff and the Defendant"; H. W. B. Davis, a noble landscape on the Wye. The blossoms are painted with consummate beauty and realism.

"My Lady's Garden," by J. Young Hunter (997), is a distinguished picture. A young lady in gorgeous garments is walking over the green lawn of an old-fashioned garden, carrying a Venetian bowl. On either side of her is a peacock, and a third with outstretched plumage walks behind. The technical workmanship, the trim-cut beds of box, and richness of colour, are qualities which invest this picture with much interest, and it is one that is selected for purchase by the Chantrey Trustees. We can only notice one other picture, "Forest Oaks" (990), by Ernest A. Waterlow, delightfully broad in handling and colour.

Mr. J. Prout, who has been for some time secretary to the Master Builders' Association at Barry, was presented by that body with a marble clock in acknowledgment of his services. Mr. Edward Phillips, Newland House, made the presentation.

## ESTIMATES.—VII.

## FACINGS, GAUGED ARCHES, MOULDED WORK.

**FACINGS** should be taken "as extra on common brickwork," including pointing. The bricks should be specified, also the pointing, and it is necessary in billing to state if the "joints are to be struck fair as the work proceeds" or "rake out and point." Openings and gauged arches are deducted. Cornices and string courses are taken either as "extra on facings" or "extra on common brickwork." If the former, the projection is measured as brickwork; if in cement, it should be stated as extra only. The mouldings are girt and billed with facing, deducting the general facing behind; if extra on common brickwork, the projection is measured as ordinary work, deducting facing behind.

**250ft. super.** Extra on common brickwork for facings of picked stocks finished with neatly struck bevelled joint as the work proceeds.

Let us take 7 bricks per foot super. :—

Selecting seven bricks at 2s. 3d. per thousand	£ s. d.
Striking bevel joints per foot super.	0 0 0½
Per foot super.	0 0 0½

Say 1d. per foot usual price.

**82ft. super.** Extra on picked stock facings for gauged segmental arches in Brown's best red rubbers, set in cement and raked out and tuck-pointed.

Price of bricks per thousand, say	£ s. d.
Unloading, cartage, and stocking, say	4 15 0
	0 3 6

Allow ten bricks per foot super. for gauged arch and waste, say	£ s. d.
Deduct cost of stocks	0 0 11
	0 0 2½

Labour, rubbing, and setting in cement	£ s. d.
Per foot super.	0 0 8½
	0 1 2

The number of bricks to be allowed per foot varies with the quality of bricks used; 10 bricks allows for waste.

Or—the calculation may be simplified thus:—

Cost of 10 rubbers at, say, 100s. per thousand	£ s. d.
Deduct cost of stocks, say	0 1 0
	0 0 2½

Cutting, rubbing, and setting	£ s. d.
	0 0 9½
	0 1 2

Add profit, say	£ s. d.
	0 1 7½
	0 0 2

**28ft. super.** Extra on common brickwork for rubbed and gauged facings of Lawrence's best red rubbers, in Flemish bond, in putty for carving.

This item may be priced at 9d. per foot. It is safer to obtain a price from an expert bricksetter, experienced in gauged and rubbed work.

**165ft. super.** Extra on common brickwork of best red Fareham facings set in putty.

Price per thousand of best red Fareham facings	£ s. d.
Railway rate to Vauxhall 14s. per thousand	3 1 0
Cartage	0 14 0
	0 2 6

Deduct cost of common stocks	£ s. d.
	3 17 5
	1 14 0

Cost of seven bricks per foot super. at above rate, say	£ s. d.
Raking out and setting in putty	0 0 3
	0 0 2½

**380ft. super.** Extra on common brickwork for red-brick facings, joints raked and pointed in blue ash mortar with neat joints.

Cost of red facings per 1,000 delivered, say	£ s. d.
Deduct cost of stocks	3 5 0
	1 17 0

(This represents 2s. 9d. per hundred, about 2½d. per foot.)	£ s. d.
Facings per foot	0 0 2½
Pointing and material	0 0 1½
	0 0 4

Say, 4½d.

**82ft. super.** Extra only on common brickwork, gauged segmental arches in best rubbers, set in cement and raked out and tuck-pointed.

This item may be put down at 1s. 8d. per foot. (See item above.)

**48ft. run.** Extra on common brickwork for hand-moulded bricks and facing for cornice 12in. high, 8in. projection, as per sketch, including setting-out, raking joints, and pointing.

Cost of moulded bricks per 1,000	£ s. d.
Unloading, cartage, &c., say	5 0 0
	0 3 6

Deduct 1,000 stocks	£ s. d.
	5 3 6
	1 14 0

Extra cost of bricks at 69s. 6d.	£ s. d.
Face 18in. girt = 1½ft. raking out, and pointing at 1½d. per foot super., say	0 0 6½
Setting out	0 0 2

No. 4 mitres	£ s. d.
No. 2 returned ends	0 0 9½
	0 2 0

Mitred angle-bricks cost about £10 per 1,000, or about 2½d. each.

**25ft. run.** Extra on facings for cut and rubbed moulding 9in. girt, raked out and pointed to match facings.

Say, 6d. per foot run.

No. 2 mitres :—Put these at 3d. each.

No. 2 moulded stops.

**320ft. super.** Extra glazed white brick facings, finished with a neat joint.

It is necessary to obtain a list of prices. These bricks range from about £10 per thousand at works for white or cream. The prime

cost at London wharf for white glazed bricks may be put at £12 per thousand, buff and cream £14, red £20, ordinary brown salt £8 10s. The second quality whites are about £2 less per thousand than the above. For carriage, the railway rate from Leeds is about 40s. per thousand, and for carting 10s. per thousand may be allowed.

Price of white glazed bricks per 1,000	£ s. d.
Railway carriage per 1,000	10 0 0
Carting, say	2 0 0
	0 8 0

Deduct 1,000 stocks at	£ s. d.
	12 8 0
	1 15 0

Allowing 7 bricks to the foot superficial, the cost of these at £10 13s. per 1,000, per foot super.	£ s. d.
Raking out joints and pointing at, say, 10d. per yard	0 0 9½
	0 0 1½

(Say 1s.)

This is perhaps a rather low calculation; the price of the best quality, white or cream, would be £12, and the price per foot may be put, including profit, at 1s. 8d. Laxton prices it at 1s. 10d., and another price-book at 2s. 3d. per foot; but the price will largely depend on the quantity.

The item "raking out mortar joints and

pointing with cement," if resolved into its elements, will comprise the amount of raking out that can be done by labourers or boys, which amounts to about ½d. per yard, the cost of a yard of cement mortar 1 to 2, bricklayer and labourer 9½d. and 1½d., may be put down as follows:—

Raking-out joints (constant 008)	£ s. d.
Pointing, bricklayer, and labourer (the constant for bricklayer being taken as '080, say, and for labourer '027), we have, at London rates, say	0 0 9
Cement and sand, mixing, &c., per yard	0 0 1½
Per yard	0 0 11

A yard of cement mortar will point about 225 yards super.

**26ft. run.** Cutting and pinning edges of stone landings with cement.

This is meant to apply to the bricklayer's labour, cutting and making good, and will vary with thickness of stone landing. A 3in. landing would cost about 2½d. to 3d. per foot run. If two courses are cut out for a 6in. or 4in. landing, the constant '044 day of a bricklayer per foot run may be taken, say, 4d.; add cement, say 1d., or 5d.

**No. 50.** Ends of steps, curbs, joists, &c., cut and pinned in cement.

Such items as these vary greatly in kind, but one average price is affixed. Sometimes for large steps, beams, or girders apertures are left in the brickwork, and then the item is for making good after beam is fixed. There would be rough-cutting to sides and top. Say it takes a bricklayer 20 minutes, or one-third of hour.

Bricklayer at 9½d., say	£ s. d.
Labourer at 6d., say	0 0 3
Cement	0 0 2
	0 0 1½

Double this may be taken if the holes are cut.

**No. 10.** 9in. by 6in. cast-iron air-bricks and setting.

The price of this item will depend on the thickness of wall. Putting cast-iron air-bricks at 6d. each, add cutting reveals 6d., rendering sides of aperture 3d., pointing, &c., 1½d. Say, 1s. 5d.

**52ft. run.** Window-sill of red splayed bricks on edge, all headers, in cement, to 4½in. reveals and fitted ends.

Cost of four bricks at £4 per 1,000	£ s. d.
Cement and labour, &c.	0 0 4
	0 0 2½
Fitted ends	0 0 6½
	0 0 2
	0 0 8½

**30ft. run.** Extra on common brickwork for best red rubbers as cornice 12in. high, 8in. projection, moulded 8in. girt, set in putty.

This may be put down at, say, 10d. per foot run.

No. 2 returned ends :—Say, 1s.

No. 4 mitres :—Say, 1s. 9d.

**92ft. run.** Circular and skewback cutting to facings. These cuttings have to be neatly made, and a fair price is about 2d. per foot run.

**No. 10.**—Setting registered stoves, including firebrick, labour, &c.

A bricklayer and labourer will take about two to three hours in setting. The fire-bricks are supplied with the stoves. Including filling-in with stock bricks and cement, the price may be put at say, 5s. to 7s., according to kind of stove.

**30ft. run.** Rake out and point to flashings in cement.

Put this at 1½d. to 2d. per foot.

**45ft. super.** One course tiles in cement.

This may be put at 3d. or 3½d.; for two courses double.

15ft. run. Cutting and pinning 4in. landing in cement.

Put this at 4d.

Cutting and pinning 18 solid steps in new work.

Say 6d. each.

Cutting and pinning ends of six window-sills, 6in. thick.

Put these at 5d. or 6d. each.

No. 8. Terracotta chimney-pots, 2ft. 6in. high, of approved design, and flaunching in cement.

	£	s.	d.
Cost of chimney-pot, say .....	0	3	6
Fixing in cement, say .....	0	1	6
	0	5	0
Profit, say .....	0	0	6
	0	5	6

Chimney-pots vary from 1d. to 1½d. per inch in height, according to design. Obtain quotations.

#### TERRACOTTA.

For pricing items of terracotta, the only reliable guide is to obtain the lists of prices of leading manufacturers—such as those of Messrs. Doulton, J. C. Edwards, Ruabon, &c., or obtain special prices delivered. The prices of the latter for red Ruabon pressed facing-bricks is 55s. 6d. per thousand in railway trucks at works, the buff terracotta facings 60s. Separate contracts for terracotta work are generally made for large buildings. Terracotta is taken per foot cube of plain, moulded, or ornamental. A price of 5s. per foot cube, including models is usual.

2,405ft. cube. Terracotta facing, chambered, and filling-in with cement concrete, setting and pointing, &c.

	£	s.	d.
Cost of terracotta delivered .....	0	4	9
Setting and pointing, say .....	0	0	8
¾ft. cement concrete filling at 14s. per yard cube, say .....	0	0	6
Mortar .....	0	0	1
Waste, cutting brickwork .....	0	0	2
	0	6	2

Deduct cubic foot of brickwork at £13 per rod, say .....

0 0 10½

0 5 3½

1,230ft. cube. Terracotta in mortar, including hoisting and setting at various levels.

This item may be taken to comprise ordinary plain or moulded terracotta. Before a price can be affixed to such an item, the estimator should examine the elevations and details, know the colour, the thickness of the blocks, if chambered, if filled-in with cement concrete, and if before or after fixing. If hoop-iron is used for bonding it should be stated, or if the blocks are joggled.

Subject to any of these conditions, the price may be put at from 4s. 9d. to 5s. 6d. per foot cube (see former item).

320ft. cube. Enriched terracotta, ditto.

It is difficult to price this without knowing the design, and the best way is, therefore, to obtain a price. For ordinary work, add about 2s. per foot to above price.

The following notes and prices of bricks, facings, and terracotta may be useful:—  
If we put stocks at 33s. and facings at 60s., the difference between these prices gives 27s. as the extra cost of facings per 1,000.

	£	s.	d.
Picked stock facings per foot super. ....	0	0	1
Ditto struck joint pointed .....	0	0	1½
Red facings, ordinary .....	0	0	2
Ditto struck joint .....	0	0	2½
Gauged facings of best cutters, set in putty and pointed .....	0	2	6
Martin's best facings, ditto .....	0	0	4½
Martin's seconds facings, ditto .....	0	0	2½
Fareham reds .....	0	0	4
White-glazed facings, half headers and half stretchers, extra over stocks per foot .....	0	1	9
Ditto struck-joint pointing .....	0	1	9½
Ditto tuck pointing .....	0	1	10½
Red moulded course, including extra pointing over the straight, and of alternate headers and stretchers 3in. high, extra only over red facings and pointing, per foot run. ....	0	0	2½

	£	s.	d.
Angle bricks to ditto, each .....	0	0	4
Red moulded courses 4½in. high, extra over red facings per foot run .....	0	0	4
6in. enriched bands extra over red facings .....	0	0	11
9in. ditto, best patterns ditto .....	0	2	3
Best red cutters, delivered within two miles of Charing Cross, in quantities per 1,000 .....	7	0	0

Malm cutters ditto .....	7	0	0
White Suffolks ditto .....	7	14	0
Ditto cutters ditto .....	4	5	0
	7	0	0

#### TERRACOTTA.

	£	s.	d.
Red, white, and buff moulded bricks, 3in. edge, per 100 .....	0	14	6
Plinths, strings, moulded, 3in. edge per foot run .....	0	0	10
Ditto, 4½in. deep .....	0	1	3
Ditto, 9in. wide, 12in. edge .....	0	2	6
Architraves .....	0	1	0
Enriched bands or string, 9in. by 3in., per 100 .....	0	16	0
Ditto, 6in. high .....	0	1	6
Ditto, 9in. high .....	0	2	0
Arch bricks, headers 9 by 4½ by 3in., each .....	0	0	2½
Ditto stretchers ditto .....	0	0	3
Keystones, enriched .....	0	9	0
Enriched panels, 24in. by 12in. ....	0	8	6
Ditto 36in. by 18in. ....	1	0	0
Enriched window heads, 4ft. long ..	1	5	0

These prices include cartage from London depot within two miles, and 10 per cent. profit; so for smaller quantities and longer distances the price must be increased in proportion.

#### "BUILDING NEWS" DESIGNING CLUB.

##### A STABLE FOR A SUBURBAN HOUSE.

TO lament over the inadequate merit of the designs sent in for this subject would serve but little purpose, and our space is too limited to allow of any lengthy remarks upon the faults which mar much of the work thus placed before us by the members of our Designing Club. The difficulties presented by the needs of a small stable are very trifling, necessitating no special knowledge, and yet affording good scope in a modest sense for the display of taste and skill. Here are the conditions and instructions issued to competitors:—

"A Stable suitable for the premises of a gentleman's suburban house, to comprise four stalls and two loose boxes, a coach-house for three carriages and space for cycles, a harness-room, groom's bedroom, and a hay-loft with shoot. Provide a covered washing space about 14ft. square or of that area. A simple brick and stone treatment to be adopted, in a picturesque and quietly dignified style. A clock-turret may be introduced, and a gateway leading into the stable-yard. A dung-pit and men's closet to be provided conveniently, but in a retired position. The entrance-front to face the south, and form the chief elevation. The group may be L-shaped in plan. Scale 8ft. to the inch. Plans may be smaller, to ½ scale. View necessary. Site level."

We have placed the three best designs in the following order:—"McGilligan" one, "Thistle" two, and "Swan" three. We cannot say that either of these designs appears very satisfactory. The first is so commonplace and wanting in interest. The plan is fairly good, though the door to the stable would have been, perhaps, better in the centre. The loft doorway coming directly over the washing-space archway is not entirely an advantage, and there is not any need to make the archway so lofty and spacious. In effect, the idea of a gateway to drive through seems to have governed the author's intention. This appearance is too much in evidence in the perspective view. We do not object to the plain unadorned walling, but we miss a sense of good proportion and the value by contrast of voids and walls. The scheme is wanting in "go," while everything looks so dull and smug. There is all the difference between a manifest striving after effect and mere utilitarian building. The latter in its best sense is of the utmost consequence. Sometimes in the hands of the uninitiated mere elementary building becomes worthy of the name of architecture; but, if so, accident is generally to be thanked for the good effect. In nine cases out of ten the good result was not artistically the end in view. On the other hand, an affectation of simplicity is very easily discerned, while a pretence at quaint conceit is at best a poor device, not likely to remain in favour long. "McGilligan" is not blamed for the simple style which he has adopted, but the design is not

calculated either to rouse one's enthusiasm or captivate our appreciative faculties.

"Thistle," on the other hand, is more ambitious, and, bringing to his aid something of the kind which we have seen before, scarcely makes an effort to be original. His sheet is more effective and less ordinary. It evinces, too, both care and industry. The plan, however, is very faulty. The covered washing space is too mixed up with the coach-house, and the stairs to the loft come badly against the stable door. There is no connection with the harness-room, save by going out into the yard. "Thistle" can hardly have studied the scheme in section, for notice how the windows would be cut into by the loft stairs from stable; and he hardly realises what head room is obtained at their top, seeing how low the rafters come down at this point. If we remember rightly, "Thistle" has made the same mistake before; and if he ignores our criticism, improvement is not likely to be secured. He has overlooked the need of an external doorway to the loft; otherwise, how is the forage to be got in to the store? It is impossible to get hay up a corn shoot, and not convenient to import it through a circular window. "Swan," to whom we give the third place, avoids this objection. His plan is L-shaped, with a separate building for the cycle-shed and tools, an entrance gateway being formed into the stable-yard between. The windows, with inverted semi-circular arches for their sills, are not a good form to adopt, and the long, sprawling flat arches over the stable windows on the other front are not very pretty. Double doors to the stable entrance are not necessary. "Quadrant" puts quadrant-arched windows in the main wall of his stable, with doorways almost as wide as the piers between, so that only about a foot of brickwork serves to connect the upper half of the wall with the lower half, and that just at the springing of these arches. The effect is bad, and so, of course, is the construction. "Quadrant's" plan is almost identical with the last. The curved-shaped gable towards the road-front would not look well seen from the sides, and the pitch of the roof behind it could not well follow the rake of the roof over the stable. "Tudor Rose" makes more of a group with an archway drive into a quadrangular yard behind, gables and dormers giving height and break of sky-line. The stable is shut off from the harness-room, and there is a hospital stall beyond the fodder-place, in the corner. This design shows care and a sense of quiet dignity in design; but the mullioned windows do not look quite in character with a stable. "Delia" makes his design too much like a farm, next which the cut yew hedges shown are out of accord. The mounted cockney horseman so prominent in the perspective sketch is probably an importation from some comic journal. "Delia's" perspective is not correct, and the plan is cast together very roughly. The author with such an indictment hardly deserves, it would seem, to rank thus high in the list. He ought to do better, for his drawing displays an artistic fancy of a kind, enough to encourage a hope on his account. "Dachs" over-labours his design, overdoing it with features. On plan a large covered washing space is marked; but in the elevations and view this is left out, for the roofing would hardly work in advantageously. The author has, however, been at great pains, and for this our praise is due. The pity is that a more unambitious type of building was not adopted. "Astragal" is better in this respect, but his plan is not good. We do not say that the elevations are all that could be desired, though they bespeak a stable. The raking buttresses suggest a quaintness which is more notable in a drawing than in reality. "Arc" has several merits, and his drawings are neat and crisp. The dodge of blacking-in one range of panes in a window and leaving another white is adopted, and suggests a deception more likely to influence the designer himself than anyone else. The roofed washing-space projecting into the stable yard seriously hampers the coach-house, which is awkwardly contrived, with the door in the corner. "Tokio" draws in outline, and has a tower covered by a dome. It is uncertain how this circular roof would come over an elongated parallelogram. The bay windows to the stairs and harness-room are sumptuous, and the gateway, too, gives too much an air of opulence; but the plan is rather well worked out. "Casual" is odd. His draughtsmanship is painstaking and clever in touch, but not very effective. The same all-over appearance is pro-

duced by his design. The turret contrivance, with the clock and loft entrance, is too pretentious. The design lacks repose in treatment. "Nothe" is not so successful as usual. The quasi-tower marking the gateway through the front building looks so much more important and worth the doing than it would appear in execution. A small slice of roof breaking out of a lower one seldom looks well, and in this case the hip does not follow the rake of the valley with all the attendant bothers of a false mitre. The plan is fairly good, but the general idea of the elevation is devoid of interest. "Antony" believes in good deep eaves; though he has much to learn as to the value of good proportion. The big entrance arch is ungainly and out of scale. "V. L. K." puts his loft-door on the wrong side, opening into the park instead of the stable-yard. Externally, the effect of grouping three gables together is pleasing; but the chimney on one side spoils the symmetry of an effect depending so entirely on the balance of its parts. "Clegornie" comes next, neat and careful, but not very distinguished. The mullioned windows were not required for the coach-house. "Scruton" draws in a highly-conventional way, with an unreal sky and impossible trees. Divest his contribution of this mannerism, and the attraction is gone. Nothing is gained by the parapet and bay-front to the loft entrance and washing-space below. The style adopted has little to recommend it. "Rikki" seems to be a more serious competitor. We like his front elevation very well. The loose-box windows spoil its simplicity, and the perspective ruins the reputation won by the geometrical drawings. The groom's bedroom ought to have had a fireplace in it. The head-room, at the top of the stairs, looks to be a matter open to debate. We hardly think it could be managed under the roof-ridge. "Grip" sends a bird's-eye view. His stable is divided into two buildings under one roof. There is no doubt that "Grip's" design would look very well if built. His stable would be airy and lofty. The hay-loft is over the coach-house, however, and the cycle-shed can only be reached through the washing space. This is not a happy arrangement, and the manure-pit is very much out of the way, increasing labour needlessly. "Honeysuckle" draws in brown ink neatly and well. A stable-door right in the angle is open to objection, and the washing-space should be more directly connected with the stable. The cycle-shed ought to be a lock-up, and not a sort of porch to the harness-room. "Clovelly," also in brown, is not so good as the last, and seems the work of a junior. The yard is very cramped, and there is no need to build in a manure-pit, and the w.c. ought to have a window. In perspective no reveal is shown to the wall openings. "Butts" is another contributor who uses brown ink, and his design is overweighted by a dome-covered tower containing a clock, and inclosing a lumber-room. The plan is elementary and workable; but we can hardly praise the scheme. "Arno" makes much of the groom's bedroom by carrying up the gateway gable in a very marked manner somewhat picturesquely, the end of the granary making a second gable towards the front, where the loft doorway is placed. "Pup" has a quadrangle and a square tower in the corner. The loose-boxes are separated from the stable. In the corner of the washing-space is a mash-boiler. Externally the design has a regulation air dominated by horizontal lines. "Blackheart" gives a homestead appearance to his group, which would look country-fied enough; but the L-shaped stable is not very convenient, neither is the corner position for the coach-house. We can only now enumerate the remaining designs. They come in the following order: "Desdichado," "Koh-i-noor," "Vulcan," "Bits," "Lumps," "B-Guy-R," "Marcus," "Vigornia," "Sham-rock," "Dodo," "Philomel," "Rook," "First Attempt," "Niche," and "Dalma Lynn."

#### NATURAL VENTILATION.

THERE is, perhaps, no subject which is of greater importance, so far as health is concerned, than that of ventilation, and it is one in which we have all a very strong personal interest. Parkes says: "Health is only possible when to other conditions is added that of a proper supply of pure air. Statistical inquiries prove beyond a doubt that of the causes of death which are usually in action, impurity of the air is the most important." Another authority says: "Any-

thing which has passed through the human body ought to be treated as excreta and rejected;—just as sewage was thrown away into the drains, so air that had passed through the human lungs should be got rid of at the earliest possible moment without allowing it to go through the lungs of someone else. It was as unreasonable to breathe the same air twice, or twelve or twenty times over, as was the case in many places, as it would be to go to the sewer for drinking water."

No one has done more for the cause of practical ventilation than Mr. Robert Boyle, who has recently added another important appliance for the preservation of health to the already long list of the well-known sanitary inventions devised by him.

This appliance, which Mr. Boyle has named "Bactolite," is intended to be employed in

BACTOLITE (Boyle's Patent).

A, Boyle's patent "air-pump" ventilator made fireproof; B, main extraction shaft incased in larger shaft, with space between packed with non-conducting material; C, double grill with space between filled with perforated asbestos balls, through which the disease germs pass, and are consumed. (Note.—More than one of these double grills may, where required, be fitted one above the other.) D, ring of atmospheric burners, the flames from which render the asbestos balls incandescent; E, fireproof chamber containing grills; F, door giving access to chamber for lighting and other purposes; G, gas-pipe; H, H, branch extraction shafts connected with openings in ceiling; J, cone covering opening in ceiling; K, weighted regulating valve; L, L, doors for giving access to extraction shafts for cleansing purposes.

small-pox and other infectious-disease hospitals. The accompanying diagram shows the method of destroying the disease germs contained in the air of a hospital, as it passes, or rather is drawn, through an asbestos furnace situated in the roof, and connected with an "air-pump" ventilator, effectually consuming the poisonous germs, and preventing them from passing into and contaminating the outer air and spreading infection.

With the "Boyle" system of ventilation, as

applied to small-pox hospitals, the air inlets communicate direct with the external air through specially-constructed openings made in the walls, fitted with self-acting valves to prevent the air of the hospital passing by any chance out through these openings. The incoming air is warmed in cold weather to an agreeable and healthy temperature by means of Boyle's ventilating radiators, without the deterioration and discomfort which result from hot-air heating.

In warm weather, the fresh-air supply is cooled in its passage through adjustable refrigerating chambers attached to the radiators, and is washed and purified by filtration through saturated and medicated screens. The outlets and inlets are accessible in all parts for cleansing purposes. It would appear, from the tests which have been made by scientific experts, that air-screens are more effective when the air is drawn through at a low velocity by natural extraction than with mechanical propulsion. Sir Douglas Galton says: "If air is forced rapidly through a screen, it cannot fail to carry dust with it."

Important features in the system under review are (1) the fresh air is brought directly into the room from the external air, there being no long, tortuous, and inaccessible channels to harbour dust and dirt; (2) the air supply not being overheated, its health-sustaining properties are unimpaired. When a building is ventilated with hot air, which also constitutes the means of heating, to satisfactorily effect the latter it is necessary to raise the air to such a high temperature that the oxygen is partially destroyed and its life-giving qualities considerably reduced. There is also experienced with this method a feeling of closeness or want of freshness, even though the air is being rapidly changed.

Professor Corfield says: "Heating should be done by means of radiant heat, and not by means of air previously warmed. If air was previously warmed it would lose a portion of its oxygen, and if we get air short of oxygen we had to breathe a greater number of times to supply the required amount, and that meant more effort."

Sir Douglas Galton states that "the method of warming the walls by means of heated air necessarily leaves the walls colder than the air of the room, and the heat of the body is radiated to the colder walls. Hence, if the walls are to be warmed by the air admitted to the room, the temperature of the warmed air must be raised beyond what is either comfortable or healthy for breathing, and thus, if you obtain your heat by warmed air alone, discomfort in one form or the other can with difficulty be avoided." This method of ventilating and warming buildings by hot air is now gradually being discarded, as the objections to it are becoming more fully recognised. With respect to this change, Professor R. H. Smith says: "A most instructive historical fact is the present gradual abandonment in the States and Canada of the hot-air system of house-warming, which was for so long popular, in favour of hot-water pipe and other 'radiator' warming. It is, in fact, impossible that the human body should absorb heat from the air in which it is immersed if that air be not made oppressively hot."

What is understood by many people as constituting the "natural" system of ventilation is simply an open window and nothing more, and it is safe to say that there are but few who have not had some experience of the evils arising from that mode of changing the air in cold weather, however useful it may be in warm. "Natural" ventilation in that form is, as a consequence, very generally condemned. In connection with this, Dr. John Hayward says: "Hospitals warmed only by open fires are sure to be very imperfectly warmed; and if at the same time they are attempted to be ventilated only by open windows, they are most certainly also very imperfectly ventilated. In spring and autumn the weather is then generally too cold to have the windows always open, and yet not cold enough to have the fires continually burning, so that the abstraction cannot then be accomplished efficiently by either windows or fires." In a Blue Book, issued in 1898, "On the Ventilation and Warming of Board Schools," on page 23 occurs this statement in reference to ventilation by open windows. "In those cases in which the ventilation was effective the temperature of the dormitory would follow closely that of the outside air, and would not exceed that of the outside by more than about 2½°." That is to say that with open-window ventilation with the outside temperature 30°, the inside temperature

would practically be the same, plus the inevitable cold draught.

This somewhat primitive form of ventilation should not, however, be confounded with a natural system of ventilation scientifically arranged to secure a continuous and imperceptible change of air at all times and in all seasons. Where comparative tests have been made with natural and artificial ventilation, open windows generally constituted the "natural" plan; but as open windows are really no system at all, such tests can only be misleading, and are obviously unfair to natural ventilation correctly applied.

It must be admitted that the reputation of natural ventilation has also suffered a good deal from the abortive attempts of individuals having little or no acquaintance with either the science or the practice of ventilation, and by the employment of so-called ventilating apparatus of crude and unscientific construction. The selection of ventilators is likewise sometimes left by an architect to the contractor, who naturally supplies those upon which he gets the largest profit, without troubling himself about their efficiency. Parkes says: "Ventilation is a science, and it requires the study of a lifetime to master properly all its intricacies," whilst De Chaumont pronounces it to be "essential to the success of a natural system of ventilation, that both the outlet and inlet ventilators be of correct construction and skilfully applied. Where this is not observed, failure generally ensues with this form of ventilation."

It is now becoming more generally recognised that natural ventilation, when correctly applied, is found to satisfactorily fulfil all requirements, and the leading authorities are practically unanimous in their approval of that method. Natural ventilation on the upward principle, or top extraction, is the plan recommended by the Government commissioners in a recent Blue Book: downward ventilation, or extraction at the bottom, being condemned. "Whilst the air is in the lungs," say the commissioners, "it acquires so much heat that it becomes specifically lighter than the surrounding air, and rises above our heads. The heated air which passes upwards should pass away. . . . For the ventilation of rooms exits should be provided for the spent air near the ceiling. . . . The method of low ventilation (extraction near the floor) should be avoided on various grounds." Professor Smith, in a recent article in the *Engineer*, deals with the respective merits of upward and downward ventilation very exhaustively, and demonstrates the superiority of the upward method. "It is clear," says Professor Smith, "that the down system can never supply really pure air to be breathed by the lungs. The exhalations of the human body are, as they issue, so warm that they must perforce immediately rise. Therefore, if the supply of fresh air comes from above, it can only reach the nose and mouth by driving down with it, and mixing with, these foul exhalations, and there is unquestionably nothing to breathe except this polluted mixture. In order to keep down the percentage of pollution to a non-dangerous degree, under this system arises, therefore, the necessity of admitting for ventilation fresh air in quantities many times greater than that actually used for breathing, and also a correspondingly extravagant expenditure of heat if this supply be artificially warmed. Thus the only ideally perfect ventilation consists in inducing a regular up-current from a level below that of the human head up to the extraction outlets at the ceiling. Under this system the bulk of fresh air required to be admitted is immensely reduced, as is also the expense of warming it to any degree considered desirable."

In the report submitted to the United States Congress by the Commission on Ventilation, the following occurs:—

"The direction of the currents of air from the human body is, under ordinary conditions, upwards, owing to the heat of the body. This current is an assistance to upward and an obstacle to downward ventilation. In large rooms, an enormous quantity of air must be introduced in the downward method, or about three times the amount which is found to give satisfactory results with the upward method. For these and other reasons the Board are of opinion that the upward method should be preferred."

Dr. John Hayward, who is one of the highest authorities on the question, says that: "To the plan of abstracting the foul air near the floor there are at least four grave objections: (1) It is opposed to Nature's law of atmospheric pressure,

and therefore requires the use of special abstracting power by means of furnaces for its accomplishment; (2) by drawing down the foul air it causes it to be breathed over again, which recently-breathed air ought never to be; (3) the fresh air supplied is apt to be forced in overheated—in fact, burned—and so made unhealthy; (4) the long, tortuous flues cannot be kept clean, and will, therefore, become lurking-places for dust and germs. The plan is quite unsuitable for hospitals, and should certainly never be used where there is likely to be infection." Another authority denounces this method as "a standing menace to the health of society," and says that the dangers of it "cannot be exaggerated."

Dr. Parkes, in "A Manual of Hygiene," recommends natural ventilation as the best for this climate, and that "for hospitals natural ventilation certainly seems the proper plan." He further says, "Incessant movement of the air is a law of nature; we have only to allow the air in our cities and dwellings to take share in this constant change, and ventilation will go on uninterruptedly without our care. In this country, and, indeed, in most countries, even comparative quiescence of the air for more than a few hours is scarcely known. Air is called 'still' when it is really moving 1 or 1½ miles an hour. Advantage, therefore, can be taken of this aspirating power of the wind to cause a movement of the air up a tube."
